PREFACE

This report was prepared by the New Mexico Engineering Research Institute (NMERI), Box 25, Albuquerque, New Mexico 87131, under Contract F29601-84-C0080, for the Air Force Engineering and Services Center, Engineering and Services Laboratory (AFESC/RDCP), Tyndall Air Force Base, Florida, 32403.

This report summarizes work done between September 1986 and September 1987. HQ AFESC/RDCP Project Officers were Mr. James Murfee, Ms. Patricia C. Suggs, and Major Mike Koch.

This report has been reviewed by the Public Affairs Office (PA) and is releasable to the National Technical Information Service (NTIS). At NTIS it will be available to the general public, including foreign nationals.

This technical report has been reviewed and is approved for publication.

SECTION I INTRODUCTION

A. OBJECTIVE

The objective of this work was to monitor several pavement test sections incorporating designs intended to retard the development of reflection cracking to improve field performance of airfield pavements.

B. BACKGROUND

Rehabilitation of pavements by placing asphalt overlays is a well-established procedure for improvement of aged pavements. Application of various treatments to existing pavements before overlay was intended to prevent or delay the appearance of cracks in the new overlay. This sort of cracking is usually referred to as reflection cracking because it reflects the original cracking pattern in the underlying pavement. Most of the development leading to the use of treatments had been carried out by agencies that construct and maintain highway pavements.

Recognizing the potential benefits of asphalt-rubber mixtures in rehabilitation and maintenance of pavement systems, the Air Force Engineering and Services Center (AFESC) initiated a technology review of the material in April 1977 (Reference 1). Two of the conclusions made in that study were: (1) that asphalt-rubber mixtures seem promising in the prevention of reflection cracking, and (2) that asphalt-rubber interlayers should be investigated in conjunction with conventional asphalt-concrete overlays.

As a result of that study, further investigations were carried out to develop specifications for use of asphalt-rubber materials as interlayers on airfield pavements. Experimental pavements were constructed at Kirtland AFB, New Mexico, Williams AFB, Arizona, and Coolidge Municipal Airport (used as an auxiliary training site by the Air Force), Arizona. These pavements were evaluated to measure performance of the materials used at each site.

A designed experiment was proposed in 1985 for a rehabilitation project at Peterson AFB, Colorado. In this case, the experiment included other techniques for retarding reflection cracking in addition to asphalt-rubber. This pavement was the fourth field experiment included for monitoring under the present study.

References 1, 2, 3, and 4 are previous reports produced on this topic.

Reference 1 provided the guidance that asphalt-rubber showed promise as a material for use in interlayers between old pavements and new overlays on airfields. Reference 2 was an extensive laboratory study of the properties of asphalt-rubber mixtures and methods of testing the material to provide useful tests for specifying asphalt-rubber in construction contracts. An experimental pavement was constructed at Kirtland AFB as part of the evaluation of the proposed guide specification. Reference 3 was an interim report on the monitoring of performance of the Kirtland AFB experimental pavement and reported on the construction of two additional test sections located in Arizona (Williams AFB and Coolidge Municipal Airport). Reference 4 is the final report on the effort and contains all the information in Reference 3, plus additional information on the construction monitoring and testing at Williams AFB and Coolidge airport. These latter test pavements were not designed experiments. The Air Force had construction projects underway involving the construction of a stress-absorbing membrane interlayer (SAMI) prior to overlaying the two runway pavements involved. Monitoring consisted of documenting the development of cracking in the overlays and making comparisons to the original cracking in the test section. Reference 4 also includes the construction documentation for a designed experiment located at Peterson AFB. In this experiment several methods of reducing reflective cracking in overlays were included in addition to asphalt-rubber. Because the opportunity existed to prepare specifications and work with the base from the development of the contract documents, the experiment is well-conceived and designed. All results have statistical significance and should prove to be valuable to the reader.

C. SCOPE

The current study assessed of the performance of test pavements located at Kirtland AFB, Williams AFB, Coolidge Municipal Airport, and Peterson AFB. The current guide specification for SAMIs was reviewed and recommendations for its further use provided. An evaluation of other methods of retarding reflective cracking (used at Peterson AFB) is reported in relation to the performance of asphalt-rubber.

SECTION II

KIRTLAND AFB, APRON A FIELD TRIAL

Apron A at Kirtland AFB was rehabilitated in November 1981 by placing an overlay on an existing asphalt-concrete pavement. Prior to release of the plans for bids the New Mexico Engineering Research Institute (NMERI) prepared an experimental plan that included several mix parameters as variables, as well as two different control sections. The objective was to compare the performance of various materials to determine if changes in the guide specification should be made, based on field performance.

The original apron was constructed in the 1940s and consisted of an asphalt concrete pavement approximately 3.8 cm (1.5 inches) thick, over a sand base. It was badly deteriorated due to environmental conditions and exhibited extensive cracking. Information on the preconstruction condition and documentation of the construction work is included in previous reports, References 2 and 3. The reconstruction involved the variables illustrated in Table 1.

Condition evaluations were performed by measuring the length of cracking in the overlay at various intervals of time after construction. These were expressed as a cracking index which was obtained by dividing the length of cracking by the area which resulted in an index with units of length to the -1 power, which was then multiplied by 10,000 to provide a convenient number. Due to the extensive and closely spaced cracking before construction, no comparison to preconstruction cracking could be made.

This work included evaluations in September 1986 and in June 1987. The earlier evaluation consisted of crack measurements and the coring of several locations. The evaluation in June consisted of a pavement condition survey only. Figure 1 shows a plot of overall average cracking on the apron versus time. It is concluded from these data that the new overlay exhibited cracking after about 2 years of age. The cracking continued to increase up to 3.5 years and then stabilized. The condition of all sections on the apron is excellent as of June 1987. Differences between sections were

TABLE 1. EXPERIMENTAL SECTIONS--APRON A

Section Code	Rubber Type	Mix Time (min)	Surface Preparation	Area (ft ²)	Remarks

1-1-1	TP044	15	H/S	22500	
1-1-2	TP044	15	SS	3000	

^aAC = asphalt-concrete

^bH/S = heater scarified

^cSS = slurry sealed

Note: Section designations have the following meanings:
 first digit is rubber type, 1-TP044, 2-C104, 3-CPR-10P;
 second digit is mix time in minutes, 1-15, 2-60, 3-160;
 third digit is surface preparation, 1-H/S, 2-SS.

Figure 1. Cracking Index Data for Apron A.

examined in earlier studies and found to be not significant with the exception of two observations at specific ages. These indicated that Control Section I was cracking more severely at certain ages than all other sections. This was due to fuel truck traffic using the pavement and did not relate to the material characteristics. At certain ages it was apparent that the long-mix-time material was cracking at a higher rate than shorter mix time materials. Since these observations were at early ages it is not certain that this trend would lead to deterioration of those sections at an earlier stage. Since the current guide specification already includes a limitation on mixing time, there does not appear to be any indication of a need for modifying the existing guide specification based on the experience from Apron A.

Cores taken at the earlier evaluation were primarily intended to indicate whether the cracking in the overlay went all the way through the pavement and whether the asphalt-rubber membrane provided a seal. Inspection of cores taken indicated that the asphalt-rubber membrane was intact and provided a seal for the cracking that occurred on Apron A.

Because the cracking index stabilized for the last 2 years no crack count was made in the last inspection. The condition has not changed since the crack count was made in September 1986. Based on the inspection of the pavement in June 1987 no new cracking is evident and the condition is still excellent.

SECTION III

WILLIAMS AFB AND COOLIDGE AUXILLARY FIELD

Sections of the runways at Williams AFB and Coolidge Auxillary Field were set up for use as test sections to study the reflection cracking in the overlay pavement as a function of age. No experimental design for these sites was possible because the contracts for construction were already out for bids before NMERI became involved in the work. The preconstruction cracking was documented and used for comparison to the subsequent cracking occurring in the overlay. Each test section was 45.7 by 45.7 meters (150 by 150 feet).

The Williams AFB test section was located on the north end of runway 12L-30R, 83.8 meters (275 feet) south of the portland cement concrete (PCC) runway end. About two-thirds of the test section was milled from a 0- to 0.6-cm (0.25-inch) depth as part of the transition to the PCC runway end. The SAMI was placed in 12 passes starting at the west pavement edge, going north, and then alternating across the width of the runway. A total of seven batches of material were prepared. Construction of the SAMI proceeded as planned and no significant deviation from the contract specifications was observed. Construction at Williams AFB took place December 13, 14, and 15, 1983.

The Coolidge Field test section was laid out in the interior of runway 5-23. An attempt was made to seal the cracks prior to SAMI placement using a CSS-1 asphalt emulsion. This was then covered with sand, resulting in a very dirty surface for placement of the overlay material. A total of eight batches of material was prepared, being placed in 12 passes. Construction at Coolidge Field took place January 18, 19, and 20, 1984.

Pavement evaluations have consisted of measuring the length of cracking in the overlay and computing the percent of original cracking that has reappeared in the overlay. The two evaluations completed for this study are shown along with previous data in Figure 2. It is clear that Coolidge Field exhibited significant percent return of cracking within the first year. The rate of cracking is continuing to remain high and as of the June 1987 evaluation exceeds the original cracking in the pavement. The Williams site

Figure 2. Percent Cracking Data for Arizona Sites.

on the other hand exhibited cracking at about 1 year of age and subsequently stabilized below 100 percent of the preconstruction cracking. Several factors may have contributed to this result.

First, the pavement section at Coolidge is not as thick as Williams, consisting of 2 inches of field-mixed AC with a 1.5-inch overlay. The Williams pavement consists of a 4-inch mat of plant-mixed AC. The base at Coolidge is a total of 9 inches versus 14 for the Williams pavement. Since the aircraft using each facility are similar, it is concluded that pavement loading directly influences the rate and the amount of cracking in the overlay. This raises the point that asphalt-rubber membranes do not provide any additional structural capacity for the pavement. It also clearly indicates that structural differences in pavements can make a significant difference in rate of cracking after construction. Some measurements of the deflection under load would provide a valuable way to compare the two pavements to indicate whether the structural capacity is allowing vertical displacements which cause the cracking.

Second, the crack filling operation at Coolidge was far less satisfactory than work done at Williams. Excessive amounts of sand and crack sealer (CSS-1 emulsion) were on the surface when the paving took place. The preparation of the surface may have contributed to the difference in performance at the two sites. However, there is no way to further investigate this question.

SECTION IV
PETERSON AFB FIELD TRIAL

A. OBJECTIVE

The objective of the study was to evaluate performance of various materials used to delay or prevent reflective cracking in asphalt concrete overlays over portland cement concrete or soil cement bases.

B. SCOPE

Two base types were included in the study. One base material was conventional jointed portland cement concrete and the other was a badly cracked soil cement base.

Both base materials had been previously overlaid with asphalt or tar concrete and both badly cracked overlays were removed by milling before placement of the experimental materials.

Study variables included:

- Asphalt-rubber stress absorbing membrane interlayers (SAMIs).
- Polymer modified asphalt-rubber stress absorbing membrane interlayers (SAMIs).
- Fabric interlayers.
- Rubber-filled asphalt concrete (RFAC).
- Conventional asphalt concrete with joints sawed at the same location as joints in the underlying portland cement concrete.
- Sawed joints were not used in trial sections on soil cement bases.
- Control (conventional asphalt-concrete without interlayers).

Interlayers consist of thin layers of low modulus (stiffness) materials placed between the base and asphalt concrete overlay. Rubber-filled asphalt-concrete consists of an overlay of gap graded asphalt-concrete with reclaimed rubber filling the gap. Control sections consist of conventional asphalt-concrete.

Two experiments were included in the study. One considered performance over jointed portland cement concrete and the other considered performance for soil cement bases. The project test matrix is shown in Table 2.

TABLE 2. PROJECT TEST MATRIX

Treatment \ Base	Number of Sections	
	Portland Cement Concrete Base	Soil Cement Base
Control, Asphalt-Concrete	2	2
Asphalt-Rubber (SAMI)	2	2
Modified Asphalt-Rubber (SAMI)	2	2
Rubber-Filled Asphalt-Concrete	2	2
Fabric (Interlayer)	2	2
Sawed Asphalt-Concrete	2	0

Each material was replicated twice to comply with requirements for statistical analysis of performance data. Therefore, the study included 22 test sections with 12 sections on the portland cement concrete base and 10 sections on the soil cement base.

Test sections on the portland cement concrete base are 70 feet wide by 275 feet in length; sections on the soil cement are 70 feet wide by 135 feet long. Length of the test sections was controlled by length constraints available at the facility and the number of materials to be included in the experiment. Asphalt-concrete overlay (or inlay) thickness varies from approximately 2 inches in thickness to 7 inches to accommodate existing drainage swale geometry (see Layout, Appendix A). Existing paving materials were milled to required depth and test materials were appropriately placed in the inlay (Appendix A). Locations of test sections for each replication of each experimental material were selected at random and placed as shown in the appendix.

Construction specifications for each material are included in Appendix B.

C. LOCATION

The study was located at Peterson AFB, Colorado on an apron improvement project. Trial sections were placed on a strip 70 feet wide by approximately 4650 feet long between the Peterson apron and taxiway 12-31. The strip begins (station 0 + 00) at the northwest end of the complex and continues to the existing Air National Guard hangers (station 46 + 50).

Sections on the portland cement concrete base are on the northwest end of the project (stations 0 + 00 to 33 + 00); sections on soil cement base are on the southeast end (station 33 + 00 to 46 + 50). Section layout and monument details are shown in Appendix A.

D. PRECONSTRUCTION DETAILS

The study area consisted of two overall sections with a drainage swale at midwidth along the entire length of the study area. The northwest section consists of an asphalt or tar concrete inlay over a 6-inch portland cement concrete pavement (base) (stations 0 + 00 to 33 + 00). The southeast section consists of asphalt or tar concrete over approximately 6 inches of soil cement (stations 33 + 00 to 46 + 50). Asphalt or tar concrete thickness varies from 1.75 to 6 inches over each base type.

Crack patterns were quite different for each base type. Asphalt- or tar-concrete over the portland cement concrete sections showed uniform block cracking, reflecting joint spacings of the portland cement concrete base. Asphalt- or tar-concrete over the soil cement sections showed random cracking with considerable alligator cracking.

E. CRACK SURVEYS AND PERFORMANCE (CRACKING) EVALUATION

All cracks were mapped to scale and summarized as follows:

1. Cracking in portland cement concrete sections was summarized as linear feet of cracking or jointing. Each 275-foot section was subdivided into 25-foot subdivisions and relative cracking was defined and calculated as linear feet of cracking per square foot of the subdivision.

2. Cracking in soil cement sections was summarized as square feet of cracking. Each 135-foot section was subdivided into two 25-foot and one 35-foot subdivision and relative cracking was defined and calculated as square feet of cracking per square foot of the subdivision.

Forms for performance evaluations (crack counts and location) and spreadsheets for analysis are on file and available on request.

F. TEST SECTION CONSTRUCTION

Construction was under the control of Peterson AFB Civil Engineer. Observations were made by NMERI personnel. Construction milling started on September 6, 1985 and paving was completed on October 12, 1985. Quality control test reports are on file at Peterson AFB and construction photographs are on file at NMERI.

Construction operations were as follows:

1. Bituminous and portland cement concrete milling: September 6-20, 1985.
2. Placement of materials (except rubber-filled asphalt-concrete) with asphalt-concrete inlay: September 25 to October 7, 1985.
3. Placement of rubber-filled asphalt concrete: October 12, 1985.

G. PERFORMANCE EVALUATION DATA

Appendixes C, D, and E include data from crack surveys and reduction and analyses of these data.

Data for portland cement base sections 1-12, sheets 1-6 of 40 consist of:

1. Columns 1 and 2 are stations within the section where crack counts were made.

2. Column 3 is the preconstruction crack count in linear feet of cracking for the particular subdivision.

3. Column 4 is crack count in linear feet of cracking at the time of the survey.

4. Column 5 is crack count in linear feet of cracking at the time of the survey calculated as a percentage of preconstruction cracking.

5. Column 6 is relative cracking. This is calculated as linear feet of cracking for the subdivision as a percentage of the subdivision area and is expressed (for portland cement concrete bases) as lineal feet per square foot.

Data for soil cement base sections 13-22, sheets 7-10 of 40 consist of:

1. Columns 1 and 2 are stations within the section where crack counts were made.

2. Column 3 is the preconstruction crack count in square feet of cracking for the particular subdivision.

3. Column 4 is crack count in square feet of cracking at the time of the survey.

4. Column 5 is crack count in square feet of cracking at the time of the survey calculated as a percentage of preconstruction cracking.

5. Column 6 is relative cracking. This is calculated as square feet of cracking for the subdivision as a percentage of the subdivision area and is expressed (for soil cement bases) as square feet per square foot.

Portland cement concrete base sections summaries and analyses of variance can be found on sheets 11-18 of 40. These analyses include:

- Total cracks
- Relative cracks

- Total cracking expressed as a percentage of total area preconstruction cracking
- Relative cracking expressed as a percentage of subdivision area preconstruction cracking

Soil cement base sections summaries and analyses of variance can be found on sheets 19-26 of 40 with the same analyses included for portland cement concrete sections.

Summaries of cracking means and data bases for sorting are on sheets 27-32 of 40.

Plots of the data are on sheets 33-40 of 40.

H. PRECONSTRUCTION CONDITION EVALUATION

Data for preconstruction evaluation are shown in Appendix C.

1. Portland cement concrete sections 1-12, results and discussion.

Preconstruction cracking as expressed by total lineal feet of cracking per section is not uniform throughout the test sections (Reference ANOVA, pages C-12 and C-33 of 40). It appears that the following groupings can be made (based on cracking):

- Sections 4, 1, 5, and 9
- Sections 6, 7, 2, 10, and 11
- Sections 12 and 8
- Section 3

Based on this nonuniformity, it is suggested that evaluations of performance of the treatments be based on analyses of cracking expressed as a percentage of original cracking.

2. Soil cement sections 13-22, results and discussion.

Preconstruction cracking as expressed by square feet of cracking per section is not uniform throughout the test sections (Reference ANOVA, pages C-20 and C-37 of 40). Section groupings appear to be uniform with the exception of Section 13.

Based on this nonuniformity, it is suggested that evaluations of performance of the treatments be based on analyses of cracking expressed as a percentage of original cracking.

I. JULY 1986 EVALUATION (EVALUATION NO. 1)

Data for this evaluation (age approximately 9 months) are shown in Appendix D.

Portland cement concrete base sections. No significant differences between treatments (Reference ANOVA, page D-12 of 40).

Soil cement base sections. Cracking had not progressed to the extent where alligator cracking appeared. Therefore data are shown and analyzed as total lineal feet of cracking. No significant differences between treatments (Reference ANOVA, page D-20 of 40).

J. JUNE 1987 EVALUATION (EVALUATION NO. 2)

Data for this evaluation (age approximately 18 months) are shown in Appendix E.

Portland cement concrete base sections. Sections 6 and 7 (sawed asphalt-concrete) have significantly less total and relative cracking than the other treatments.

Soil cement base sections. Cracking had not advanced to the point where areas of cracking can be measured. Analysis was based on lineal feet of cracking and, at the time of this evaluation, there were no significant differences between treatments.

SECTION V

SUMMARY AND CONCLUSIONS

A. WILLIAMS AFB AND COOLIDGE FIELD

Since neither of these installations used a control section for comparison of reflection crack progression between overlays using asphalt-rubber SAMIs and conventional construction, conclusions regarding the effectiveness of the SAMI cannot be made. In addition, it appears that in some sections on Coolidge more cracks appear in the overlay than existed prior to the overlay, indicating significant deterioration of the pavement structure since placement of the SAMI.

One apparent outcome is that reflection cracks in the experimental sections progress at a slower rate for thicker structural sections.

B. KIRTLAND AFB

After approximately 4 years (nine experimental asphalt-rubber and two control sections) no significant performance differences exist between any of the treatments and the control sections. Therefore, observations should be continued to monitor longer term performance.

C. PETERSON AFB

Sufficient time has not elapsed since construction to draw valid conclusions. It does appear that the sawed-joint system is performing better (at this early date) over jointed portland cement concrete bases than the other treatments, but it should be understood that this observation is based on less than 2 years service.

It is strongly recommended that observations be continued for at least another 2 years with observations twice per year. Forms for performance evaluation are available along with statistical analysis forms that have been designed for this project.

APPLICABLE SPECIFICATION SECTIONS--PETERSON AFB

Section B-1	Bituminous Intermediate and Wearing Courses For Airfields, Heliports, and Heavy-Duty Pavements
Section B-2	Asphalt-Rubber Surface Treatment or Interlayer
Section B-3	Polymer Modified Asphalt-Rubber Surface Treatment or Interlayer
Section B-4	Rubber-Filled Asphalt-Concrete
Section B-5	Polypropylene Pavement Reinforcing Fabric
Section B-6	Cold Milling

SUMMARY OF KEY SPECIFICATION ITEMS

<u>SECTION PARA</u>	<u>ITEM</u>	<u>ITEM DESCRIPTION</u>
B-1, 7.1	Samples	Hot-Mix Aggregates
B-1, 7.2	Certificate	Hot-Mix Aggregate Source Approval
B-1, 8.1.1	Samples	Hot-Mix Field Samples
B-1, 10	Certificates	Waybills and Delivery Tickets for Aggregates and Bituminous Materials
B-1, 14.1.4	Certificates	Hot-Mix Aggregate Quality
B-1, 14.4	Approval	Antistripping Agent (if used)
B-1, 16.1	Mixture Design	Job-Mix Formula (JMF)
B-2, 3.7	Certificates	Specification Compliance for Asphalt-Rubber
B-2, 5.3	Letter	Job Delay and Holdover Times
B-3, 3.3	Certificates	Specification Compliance for Modified Asphalt-Rubber
B-3, 5.3	Letter	Reference 3B-5.3; Job Delay and Holdover Times
B-4, 3	Mixture Design	Job-Mix Formula (JMF) for Rubber Filled Asphalt Concrete
B-4, 3.2	Samples	Asphalt Cement and Rubber Samples
B-4, 5	Samples	Aggregate Samples
B-5, 3	Certificate	Specification Compliance of Polypropylene Pavement Reinforcing Fabric

PART 1 - GENERAL

1. APPLICABLE PUBLICATIONS: The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.1 Military Standard (MIL-STD)

MIL-STD 620A & Notice 1	Test Methods for Bituminous Paving Materials
----------------------------	---

1.2 U.S. Army Corps of Engineers, Handbook for Concrete and Cement:

CRD-C 119-53 Rev. June 63	Flat and Elongated Particles in Coarse Aggregate
------------------------------	---

1.3 American Society for Testing and Materials (ASTM) Publications:

C 29-78	Unit Weight and Voids in Aggregate
C 88-76	Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
C 127-81	Specific Gravity and Absorption of Coarse Aggregate
C 128-79	Specific Gravity and Absorption of Fine Aggregate
C 131-81	Resistance to Degradation of Small Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
C 136-82	Sieve Analysis of Fine and Coarse Aggregates
C 183-78	Sampling Hydraulic Cement

D 5-73 (R 1978)	Penetration of Bituminous Materials
D 75-82	Sampling Aggregate
D 140-70 (R 1981)	Sampling Bituminous Materials
D 242-70 (R 1980)	Mineral Filler for Bituminous Paving Mixtures
D 1250-80	Petroleum Measurement Tables
D 1856-79	Recovery of Asphalt from Solution by Abson Method
D 2041-78	Theoretical Maximum Specific Gravity of Bituminous Paving Mixtures
D 2042-81	Solubility of Asphalt Materials in Trichloroethylene
D 2172-81	Quantitative Extraction of Bitumen from Bituminous Paving Mixtures
D 2216-80	Laboratory Determination of Water (Moisture) Content of Soil, Rock, and Soil-Aggregate Mixtures
D 3381-81	Viscosity-Graded Asphalt Cement for Use in Pavement Construction
D 3515-81	Hot-Mixed, Hot-laid Bituminous Paving Mixtures

2. PLANT, EQUIPMENT, MACHINES, AND TOOLS: The Bituminous plant shall be of such capacity, as specified hereinafter, to produce the quantities of bituminous mixtures required for the project. Hauling equipment, paving machines, rollers, miscellaneous equipment, and tools shall be provided in sufficient numbers and capacity and in proper working condition to place the bituminous paving mixtures at a rate equal to the plant output.

3. MIXING PLANTS : The mixing plant shall be an automatic or semiautomatic controlled, commercially manufactured unit designed and operated to consistently produce a mixture within the job-mix formula (JMF).

The plant shall have a minimum capacity of 250 tons per hour. Drum mixers shall be prequalified at the production rate to be used during actual mix production. The prequalification tests will include extraction and recovery of the asphalt cement in accordance with ASTM D 2172 and ASTM D 1856. The penetration of the recovered asphalt binder shall not be less than 60 percent of the original penetration, as measured in accordance with ASTM D 5.

4. WEATHER LIMITATIONS : Bituminous courses shall be constructed only when the base course or existing pavement has no free water on the surface. Unless otherwise directed, asphalt courses shall not be constructed when the temperature of the surface of the existing pavement or base course is below 40 degrees F.

5. PROTECTION OF PAVEMENT : After final rolling, no vehicular traffic of any kind shall be permitted on the pavement until the pavement has cooled to 140 degrees F.

6. GRADE AND SURFACE-SMOOTHNESS REQUIREMENTS : Finished surface of pavements, when tested as specified below and in paragraph ACCEPTABILITY OF WORK, shall conform to elevations shown and to the surface smoothness requirements specified. The grade of the completed surface shall not deviate more than 0.05 foot from the plan grade.

6.1 Plan Grade : Finished surfaces shall conform within tolerances specified to the cross sections indicated. Finished surfaces of airfield and heliport runways, taxiways, and aprons shall vary not more than 0.03 foot from the plan elevation established and approved at site of work, in accordance with the paragraph GRADE CONTROL. Finished surfaces of nonaircraft traffic areas, such as blast pads and stabilized shoulders, shall vary not more than 0.05 foot from plan elevation established and approved at site. Finished surfaces at juncture with other pavements shall coincide with finished surfaces of abutting pavements. The 0.03-foot and 0.05-foot deviations from the plan elevation will not be permitted in areas of pavements where closer conformance with planned elevation is required for the proper functioning of drainage and other appurtenant structures involved. Grade will be determined and evaluated as specified in paragraph ACCEPTABILITY OF WORK.

6.2 Surface Smoothness: Finished surfaces shall not deviate from the testing edge of a 12-foot straightedge more than the tolerances shown for the respective pavement category shown in Table 1. Surface smoothness will be determined and evaluated as specified in paragraph ACCEPTABILITY OF WORK.

6.3 Straightedge: The Contractor shall furnish and maintain at the site, in good condition, one straightedge for each bituminous paver, for use of the Contracting Officer in testing the finished surface. Straightedges shall be constructed of aluminum and shall have blades of box or box-girder cross section with flat bottom reinforced to insure rigidity and accuracy. Straightedges shall have handles to facilitate movement on pavement.

TABLE 1. SURFACE-SMOOTHNESS TOLERANCES

Item No.	Pavement Category	Direction of Testing	Tolerance for Intermediate Course, inch	Tolerance for Wearing Course, inch
1.	Runways and Taxiways	Longitudinal	1/4	1/8
		Transverse	1/4	1/4
2.	Calibration hardstands and compass swinging bases	Longitudinal	1/4	3/16
		Transverse	1/4	3/16
3.	All other airfield and helicopter paved areas	Longitudinal	1/4	1/4
		Transverse	1/4	1/4

7. AGGREGATE SAMPLING AND TESTING

7.1 Aggregates: Samples of aggregates shall be furnished by the Contractor for approval of aggregate sources and stockpiles prior to the start of production and at intervals during production of the bituminous mixtures. Intervals and points of sampling will be designated by the Contracting Officer. Samples will be the basis of approval of specific sources or stockpiles of aggregates for aggregate requirements. Unless otherwise directed, ASTM D 75 shall be used in sampling coarse aggregate and fine aggregate, and ASTM C 183 shall be used in sampling mineral filler

All tests necessary to determine compliance with requirements specified herein will be made by the Government at no expense to the Contractor.

7.2 Sources: Sources of aggregates shall be selected well in advance of the time the materials are required in the work. If a previously developed source is selected, samples shall be submitted 30 calendar days before starting production, with evidence that central-plant, hot-mix bituminous pavements constructed with the aggregates have had a satisfactory service record of at least five years under similar climatic and traffic conditions. Satisfactory service record for an aggregate will be determined based on the aggregate's ability to resist polishing, raveling, stripping, and degradation under traffic and climatic conditions similar to those expected during its use. If performance data indicate that an aggregate is susceptible to one or more of the above-mentioned problems, that source of aggregate shall be rejected. When new sources are developed, the Contractor shall indicate sources and submit samples and his plan for operation 60 calendar days before starting production. The Contracting Officer will make such tests and other investigations as necessary to determine whether aggregates meeting the requirements specified herein can be produced from the proposed sources. Approval of the source of aggregates does not relieve the Contractor of the responsibility for delivery at the jobsite of aggregates that meet the requirements specified herein.

8. ACCEPTABILITY OF WORK:

8.1 General: A lot shall be that quantity of construction that will be evaluated for compliance with specification requirements. A lot shall be equal to 1000 tons or one days production, whichever is less. Testing for acceptability of work will be performed by the Government.

8.1.1 In order to evaluate aggregate gradation, asphalt content, and density, each lot shall be divided into four equal sublots. For density, determination, one random sample shall be taken from the mat, and one random sample shall be taken from the joint of each sublot. Each random sample shall weigh at least 1250 grams. After air drying to a constant weight, random samples obtained from the mat will be used for density determination using MIL-STD-620, Method 101. Samples for determining asphalt content and aggregate gradation shall be taken from loaded trucks within each sublot. Asphalt content will be determined in accordance with ASTM D 2172, Method A or B. Gradation of the aggregate shall be determined from the recovered aggregate according to ASTM C 136.

8.1.2 When a lot of material fails to meet the specification requirements, that lot shall be removed and replaced or accepted at a reduced price. The lowest payment for any pavement characteristic (i.e., gradation, asphalt content, density, grade, and smoothness) discussed below shall be the percent payment for that lot. The percent payment is applied to the bid price to determine actual payment.

8.1.3 The Contracting Officer reserves the right to sample and test any area which appears to deviate from the specification requirements. Testing in these areas will be in addition to the lot testing, and the requirements for these areas will be the same as those for a lot.

8.2 Aggregate Gradation. The mean absolute deviation of the four subplot aggregate gradations from the JMF for each sieve size will be evaluated and compared with Table II. The percent payment based on aggregate gradation shall be the lowest value determined for any sieve size in Table II. All aggregate gradation results will be reported within 24 hours after completion of construction of each lot. The computation of mean absolute deviation for one sieve size is illustrated below:

Example: Assume the following JMF and subplot test results for aggregate gradation.

Sieve Size	JMF	Test No. 1	Test No. 2	Test No. 3	Test No. 4
3/4 in.	100	100	100	100	100
1/2 in.	88	87	88	90	88
3/8 in.	75	72	77	78	74
No. 4	64	60	65	67	62
No. 8	53	50	56	57	52
No. 16	42	39	44	45	41
No. 30	32	30	34	35	32
No. 50	20	17	20	22	21
No. 100	10	8	10	10	11
No. 200	6	4	7	8	6

$$\text{Mean Absolute Deviation (No. 200 sieve)} = \frac{|4-6| + |7-6| + |8-6| + |6-6|}{4}$$

$$= \frac{2 + 1 + 2 + 0}{4} = 1.25$$

The mean absolute deviation for other sieve sizes can be determined in a similar way for this example to be

Sieve Size	3/4 Inch	1/2 Inch	3/8 Inch	No. 4	No. 8	No. 16	No. 30	No. 50	No. 100
Mean Absolute Deviation	0	0.75	2.25	2.50	2.75	2.25	1.75	1.50	0.75

The least payment for any sieve size listed in Table II would be 98 percent for the No. 200 sieve. Therefore for this example the percent payment determined for aggregate gradation is 98 percent.

8.3 Asphalt Content. The mean absolute deviation of the four asphalt contents from the JMF will be evaluated and compared with Table III. The percent payment for asphalt content shall be the value determined in accordance with Table III. All asphalt content results will be reported within 24 hours after completion of construction of each lot.

TABLE II

PERCENT PAYMENT FOR MEAN ABSOLUTE DEVIATION
OF AGGREGATE GRADATIONS FROM JMF

Sieve Size	Percent Payment for Mean Absolute Deviation from JMF						
	0.0-1.0	1.1-2.0	2.1-3.0	3.1-4.0	4.1-5.0	5.1-6.0	Above 6.0
3/4 in.	100	100	100	100	98	95	90
1/2 in.	100	100	100	100	98	95	90
3/8 in.	100	100	100	100	98	95	90
No. 4	100	100	100	100	98	95	90
No. 8	100	100	100	98	95	90	Reject
No. 16	100	100	100	98	95	90	Reject
No. 30	100	100	100	98	95	90	Reject
No. 50	100	100	100	98	95	90	Reject
No. 100	100	98	95	90	90	Reject	Reject
No. 200	100	98	90	Reject	Reject	Reject	Reject

TABLE III

PERCENT PAYMENT FOR ASPHALT

Mean Absolute Deviation of Extracted Asphalt Content from JMF	Percent Payment
Less than 0.20	100
0.21 - 0.30	98
0.31 - 0.35	95
0.36 - 0.40	90
Above 0.40	Reject

8.4 Density. The average mat density and the average joint density will be expressed as a percentage of the laboratory density. The laboratory density for each lot will be determined from four sets of laboratory samples. One sample will be obtained from each of the four sublots. Laboratory samples will be prepared from asphalt mixture which has not been reheated in the laboratory. Samples will be compacted in accordance with MIL-STD-620 within 2 hours of the time the mixture was loaded into trucks at the asphalt plant.

8.4.1 The field density will be determined and compared with Table IV. The percent payment for density shall be the lowest value determined from Table IV. The percent payment for mat density represents all of the material placed in the lot. The percent payment for joint density is based on the amount of material represented by an area equal to the lot joint length by 10 feet wide not to exceed the lot size.

8.4.2 All density results on a lot will be completed and reported within 24 hours after construction of that lot. When the Contracting Officer considers it necessary to take additional samples for density measurements, sampling will be done in groups of four (one for each sublot). The percent payment shall be determined for each additional group of four samples and averaged with the percent payment for the original group to determine the final percent payment. The Contractor shall fill all sample holes with hot mix and compact.

8.5 Grade. The finished surface of the pavement will be tested for conformance with specified plan-grade requirements. The finished grade of each pavement area will be determined by running lines of levels at intervals of 25 feet or less longitudinally and transversely to determine the elevation of the completed pavement. Within 5 working days after completion of a particular lot, the Contracting Officer will inform the Contractor in writing of results of grade-conformance tests. When more than 5 percent of all measurements made within a lot are outside the specified tolerances, the payment for that lot will not exceed 95 percent of the bid price. In areas where the grade exceeds the plan-grade tolerances given in paragraph GRADE AND SURFACE-SMOOTHNESS REQUIREMENTS by more than 50 percent, the Contracting Officer shall require removal and replacement of the deficient area at no additional cost to the Government. Sufficient material shall be removed to allow at least 1 inch of asphalt concrete to be placed. Skin patching for correcting low areas or planing for correcting high areas shall not be permitted on the wearing course.

TABLE IV

PERCENT PAYMENT FOR DENSITY

Ave. Mat Density (4 Cores)	Percent Payment	Ave. Joint Density (4 Cores)
98.0, 100.0	100	Above 96.5
97.9	100	96.4
97.8, 100.1	99.9	96.3
97.7	99.8	96.2
97.6, 100.2	99.6	96.1
97.5	99.4	96
97.4, 100.3	99.1	95.9
97.3	98.7	95.8
97.2, 100.4	98.3	95.7
97.1	97.8	95.6
97.0, 100.5	97.3	95.5
96.9	96.3	95.4
96.8, 100.6	94.1	95.3
96.7	92.2	95.2
96.6, 100.7	90.3	95.1
96.5	87.9	95
96.4, 100.8	85.7	94.9
96.3	83.3	94.8
96.2, 100.9	80.6	94.7
96.1	78	94.6
96.0, 101.0	75	94.5
Below 96.0	Reject	Below 94.5
Above 101.0	Reject	

8.6 Surface Smoothness : After the completion of final rolling of a lot, the compacted surface will be tested by the Contracting Officer with a 12-foot straightedge. Measurements will be made perpendicular to and across all joints at equal distances along the joint not to exceed 25 feet. Location and deviation from straightedge for all measurements will be recorded. When more than 5 percent of all measurements along the joints within the lot exceed the specified tolerance, the unit price for that lot shall not exceed 95 percent of the bid price. Any joint or mat area surface deviation which exceeds the tolerance given in Table I by more than 50 percent shall be corrected to meet the specification requirements.

9. ACCESS TO PLANT AND EQUIPMENT : The Contracting Officer shall have access at all times to all parts of the paving plant for checking adequacy of equipment in use; inspecting operation of the plant; verifying weights, proportions, and character of materials; and checking temperatures maintained in preparation of mixtures.

10. WAYBILLS AND DELIVERY TICKETS : Waybills and delivery tickets shall be submitted to the Contracting Officer during progress of the work. Before the final statement is allowed, the Contractor shall file with the Contracting Officer certified waybills and certified delivery tickets for all aggregates and bituminous materials actually used in the construction and covered by the contract.

11 MEASUREMENT :

11.1 Intermediate and Wearing-Course Tonnage : The amount paid for will be the number of 2,000-pound tons of bituminous mixture used in the accepted work. Bituminous mixture shall be weighed after mixing, and no deduction will be made for weight of bituminous materials incorporated herein.

11.2 Correction Factor for Aggregate Used : Quantities of paving mixtures called for are based on aggregates having a specific gravity of 2.70 as determined in accordance with the Apparent Specific Gravity paragraphs in ASTM C 127 and ASTM C 128. Correction in tonnage of intermediate and wearing-course mixtures shall be made to compensate for the difference in tonnage of mixtures used in the project, when specific gravities of aggregates used in mixtures are more than 2.75 and less than 2.65. Tonnage paid for will be the number of tons used, proportionately corrected for specific gravities, using 2.70 as the base correctional factor.

11.3 Bituminous Material. Bituminous material to be paid for shall be the number of 2,000-pound tons of material used in the accepted work.

12. PAYMENT: Quantities of intermediate and wearing-course mixtures and bituminous materials, determined as specified above, will be paid for at respective contract unit prices or at specified reduced prices. Payment shall constitute full compensation for preparing or reconditioning the base course or existing pavement; for furnishing all materials, equipment, plant, and tools; and for all labor and other incidentals necessary to complete the work required by this section of the specifications.

PART 2 - PRODUCTS

13. BITUMINOUS HOT MIX shall consist of coarse aggregate, fine aggregate, mineral filler, bituminous material, and approved additives, if required, of the quantities and in the proportions specified.

14. PROPERTIES OF AGGREGATES, BITUMINOUS MATERIALS, AND BITUMINOUS MIXTURES:

14.1 Aggregates: Aggregates shall consist of natural sand, crushed stone, crushed gravel, crushed slag, screenings, sand, and mineral filler, as required. The portion of materials retained on the No. 4 sieve shall be known as coarse aggregate; the portion passing the No. 4 sieve and retained on the No. 200 sieve as fine aggregate; and the portion passing the No. 200 sieve as mineral filler. Aggregate gradation shall conform to gradation(s) specified in Table V. Table V is based on aggregates of uniform specific gravity; the percentage passing various sieves may be changed by the Contracting Officer when aggregates of varying specific gravities are used. Adjustments of percentages passing various sieves may be directed by the Contracting Officer when aggregates vary by more than 0.2 in specific gravity.

TABLE V. AGGREGATE GRADATION

<u>Sieve</u>	<u>Percent Passing</u>
3/4 In	100
1/2 In	82 ± 10
3/8 In	74 ± 10
No. 4	56 ± 10
No. 8	41 ± 10
No. 50	6 ± 7
No. 200	7.5 ± 3

14.1.1 Coarse aggregate shall consist of clean, sound, durable particles meeting the following requirements

14.1.1.1 Percentage of loss shall not exceed 40 after 500 revolutions, as determined in accordance with ASTM C 131

14.1.1.2 Percentage of loss shall not exceed 15 after five cycles performed in accordance with ASTM C 88 using magnesium sulfate.

14.1.1.3 The dry weight of crushed slag shall not be less than 75 pcf, as determined in accordance with ASTM C 29.

14.1.1.4 Crushed gravel retained on the No. 4 sieve and each coarser sieve listed in Table V shall contain at least 75 percent by weight of crushed pieces having two or more fractured faces with the area of each face equal to at least 75 percent of the smallest midsectional area of the piece. When two fractures are contiguous, the angle between planes of fractures shall be at least 30 degrees to count as two fractured faces

14.1.1.5 Particle shape of crushed aggregates shall be essentially cubic. Quantity of flat and elongated particles in any sieve size shall not exceed 20 percent by weight, when determined in accordance with CRD-C 119.

14.1.2 Fine aggregate shall consist of clean, sound, durable, angular particles produced by crushing stone, slag, or gravel that meets requirements for wear and soundness specified for coarse aggregate. Fine aggregate produced by crushing gravel shall have at least 90 percent by weight of

crushed particles having two or more fractured faces in the portion retained on the No. 30 sieve. This requirement shall apply to material before blending with natural sand, when blending is necessary. Quantity of natural sand to be added to the wearing or intermediate-course mixtures shall not exceed 15 percent by weight of coarse and fine aggregate and material passing the No. 200 sieve. Natural sand shall be clean and free from clay and organic matter. Percentage of loss shall not exceed 15 after five cycles of the soundness test performed in accordance with ASTM C 88 using magnesium sulfate.

14.1.3 Mineral filler shall conform to ASTM D 242 except the following gradations will be included:

<u>Grain Size in mm</u>	<u>Percent finer</u>
0.05	70-100
0.02	35-65
0.005	10-22

14.1.4 Sampling and Testing. Sampling and testing shall be the responsibility of the Contractor. Sampling and testing shall be performed by an approved independent commercial testing laboratory with results certified by a registered professional engineer. Certification based on past performance of the aggregates and testing can be used with the approval of the Contracting Officer. Approval must be obtained 30 calendar days prior to use of the aggregates.

14.2 Bituminous Materials: Samples of bituminous materials shall be obtained by the Contractor; sampling shall be in accordance with ASTM D 140. Tests necessary to determine conformance with requirements specified herein will be performed by the Contracting Officer without cost to the Contractor. Sources where bituminous materials are obtained shall be selected in advance of time when materials will be required in the work, and samples of the asphalt cement specified shall be submitted for approval not less than seven days before production of the asphalt mixture.

14.2.1 Asphalt cement shall conform to ASTM D 3381 Table 1, Grade AC-20.

14.2.2 In addition to initial qualification testing of bituminous materials, samples shall be taken before and during construction when shipments of bituminous materials are received or when necessary to assure that handling or storage has not been detrimental to the bituminous material. The samples shall be taken by the Contractor and tested by the Contracting Officer.

14.3 Bituminous Mixtures : Sampling and testing will be accomplished by the Contracting Officer. Bituminous mixtures shall conform to requirements contained in paragraphs PROPORTIONING OF MIXTURE and ACCEPTABILITY OF WORK.

14.4 Additives : The use of additives such as antistripping and antifoaming agents is subject to approval by the Contracting Officer.

15 DELIVERY, STORAGE, AND HANDLING OF MATERIALS

15.1 Mineral Aggregates : Mineral aggregates shall be delivered to the site of the bituminous mixing plant and stockpiled in such a manner as to preclude fracturing of the aggregate particles, segregation, contamination, or intermingling of different materials in the stockpiles or cold-feed hoppers. Mineral filler shall be delivered, stored, and introduced into the mixing plant in a manner to preclude exposure to moisture or other detrimental conditions.

15.2 Bituminous Materials : Bituminous materials shall be maintained at appropriate temperature during storage but shall not be heated by application of direct flame to walls of storage tanks or transfer lines. Storage tanks, transfer lines, and weigh bucket shall be thoroughly cleaned before a different type or grade of bitumen is introduced into the system. The asphalt cement shall be heated sufficiently to allow satisfactory pumping of the material; however, the storage temperature shall be maintained below 300 degrees F.

16 PROPORTIONING OF MIXTURE

16.1 Job Mix Formula : The mixture design and job mix formula will be developed by the Contractor at no additional expense to the Government. The mixture design shall be prepared under the direct supervision of a registered professional engineer experienced in the development of mixture designs and mixture design testing. Procedures for the mixture design will be in accordance with MIL-STD-620 and to the criteria described in paragraphs 14 and 16. The proposed mixture design and job mix formula will be submitted

to the Contracting Officer for approval 21 days prior to beginning production of bituminous mixture for this project. No payment will be made for mixture produced prior to the approval of the mixture design and job mix formula. The formula will indicate the percentage of each stockpile and mineral filler, the percentage passing each sieve size, the percentage of bitumen, and the temperature of the completed mixture when discharged from the mixer. The proposed mixture design will also include source of bituminous material and source of aggregates along with certification that aggregates meet the requirements of paragraph 14. Tolerances are given in Table VI for asphalt content, temperature, and aggregate grading for tests conducted on the mix as discharged from the mixing plant; however, the final evaluation of aggregate gradation and asphalt content will be based on paragraph ACCEPTABILITY OF WORK. Bituminous mixture that deviates more than 25 degrees from JMF shall be rejected. The JMF may be adjusted during construction to improve paving mixtures, as directed, without adjustments in the contract unit price.

TABLE VI. JOB-MIX TOLERANCES

<u>Material</u>	<u>Tolerance, Plus or Minus</u>
Aggregate passing No. 4 or larger sieves	4 percent
Aggregate passing Nos. 8, 16, 30, and 50 sieves	3 percent
Aggregate passing Nos. 100 and 200 sieves	1.0 percent
Bitumen	0.20 percent
Temperature of mixing	25 degrees F

16.2 Test Properties of Bituminous Mixtures: Finished mixture shall meet requirements described below when tested in accordance with MIL-STD-620 (75 blow, Marshall Method). All samples will be compacted with 75 blows of specified hammer on each side of sample. When bituminous mixture fails to meet the requirements specified below, the paving operation shall be stopped until the cause of noncompliance is determined and corrected.

16.2.1 Requirements for stability, flow, and voids are shown in Tables VII and VIII for nonabsorptive and absorptive aggregates, respectively.

TABLE VII. NONABSORPTIVE-AGGREGATE MIXTURE

Stability minimum, pounds	1800
Flow maximum, 1/100 inch units	16
Voids total mix, percent (1)	3-5
Voids filled with bitumen, percent	70-80

(1) The Contracting Officer may permit deviations from limits specified when gyratory method of design is used to develop JMF.

TABLE VIII. ABSORPTIVE-AGGREGATE MIXTURE

Stability minimum, pounds	1800
Flow maximum, 1/100 inch units	16
Voids total mix, percent (1)	2-4
Voids filled with bitumen, percent	75-85

(1) The Contracting Officer may permit deviations from limits specified when gyratory method of design is used to develop JMF.

16.2.1.1 When the water-absorption value of the entire blend of aggregate does not exceed 2.5 percent, as determined in accordance with ASTM C 127 and C 128, the aggregate is designated as nonabsorptive. The theoretical specific gravity computed from the apparent specific gravity or ASTM D 2041 will be used in computing voids total mix and voids filled with bitumen, and the mixture shall meet the requirements in Table VII.

16.2.1.2 When the water-absorption value of the entire blend of aggregate exceeds 2.5 percent as determined in accordance with ASTM C 127 and ASTM C 128, the aggregate is designated as absorptive. The theoretical specific gravity computed from the bulk-impregnated specific gravity method contained in MIL-STD-620, Method 105 or ASTM D 2041 shall be used in computing percentages of voids total mix and voids filled with bitumen; the mixture shall meet requirements in Table VIII, when MIL-STD-620, Method 105 is used and Table VII when ASTM D 2041 is used.

16.2.2 The index of retained stability must be greater than 75 percent as determined by MIL-STD-620, Method 104. When the index of retained stability is less than 75, the aggregate stripping tendencies may be countered by the use of hydrated lime or by treating the bitumen with an approved antistripping agent. The hydrated lime is considered as mineral filler and should be considered in the gradation requirements. The amount of hydrated lime or antistripping agent added to bitumen shall be sufficient, as approved by the Contracting Officer, to produce an index of retained stability of not less than 75 percent. No additional payment will be made to the Contractor for addition of antistripping agent or hydrated lime required.

PART 3 - EXECUTION

17. CONDITIONING OF BASE COURSE OR EXISTING PAVEMENT : Previously constructed base course or existing pavement shall be conditioned as specified below. In all cases, prior to the laying of bituminous course, the surface shall be prepared as directed that will include a tack coat for asphalt concrete and sawed asphalt concrete test sections.

17.1 Treatment of Existing Pavements That Will Serve as Base for Overlay or Other Treatments.

17.1.1 Seal all cracks that are wider than 1/8 inch

17.1.1.1 Joints and cracks that are greater than 1/8 inch and less than 1/4 inch in opening width shall be cleaned by compressed air. This cleaning shall remove all loose material such as old sealant and debris that has accumulated as a result of service or removal of existing overlay(s). These cracks shall be filled with a sealant approved by the Contracting Officer. Sealant shall be allowed sufficient time to cure prior to placement of any overlay material including fabric, stress absorbing membrane interlayer, or conventional asphalt concrete overlay.

17.1.1.2 Joints and cracks that are wider than 1/4 inch shall be cleaned by a combination of mechanical routing, wire brushing, or high-pressure water blasting and compressed air to remove all old sealant, and other materials such as old paving components and debris. All joints and cracks will be allowed to come to complete dryness before any subsequent applications of sealant, overlay, or other following work. Joints and cracks that are wider than 1/4 inch and less than 1/2 inch shall be filled to within 1/2 inch of the surface at the time of sealing with a sealant material approved by the Contracting Officer. Joints and cracks with openings greater than 1/2 inch shall be filled to within 1/2 inch of the surface at the time of sealing with a sealant consisting of 80 percent by weight of mixture of fine sand and 20 percent slow cure emulsified asphalt that is hand rammed and compacted into the joint or crack.

18. GRADE CONTROL : Lines and grades shown on contract drawings for each pavement category of contract shall be established and maintained by means of line and grade stakes placed at the site of work by the Contractor. Elevations of bench marks used by the Contractor for controlling airfield and heliport pavement operations at the site of work will be determined, established, and maintained by the Government. Finished pavement elevations shown shall be established and controlled at the site of work by the Contractor in accordance with bench mark elevations furnished by the Contracting Officer.

19 PREPARATION OF MINERAL AGGREGATES : Each aggregate stockpile shall be placed and maintained in such a manner to prevent segregation. Rates of feed of aggregates shall be regulated so that moisture content and temperature of aggregates will be within tolerances specified herein. Dry storage shall be provided for mineral filler.

20 PREPARATION OF BITUMINOUS MIXTURES : Aggregates, mineral filler, and bitumen shall be conveyed into the mixer in proportionate quantities required to meet the JMF. Mixing time shall be as required to obtain a uniform coating of the aggregate with the bituminous material. Temperatures of bitumen at the time of mixing shall not exceed 300 degrees F. Temperature of aggregate and mineral filler in the mixer shall not exceed 325 degrees F when the bitumen is added. Overheated and carbonized mixtures or mixtures that foam will be rejected.

21. **WATER CONTENT OF AGGREGATES :** Drying operations shall reduce the water content of mixture to less than 0.75 percent. Water content test will be conducted in accordance with ASTM D 2216: weight of sample shall be at least 500 grams. If water content is determined on hot bin samples, the water content will be a weighted average based on the composition of the blend.

22. **STORAGE OF BITUMINOUS PAVING MIXTURE :** Storage of bituminous paving mixture shall conform to the applicable requirements of ASTM D 3515, however, in no case shall the mixture be stored for more than 4 hours.

23. **TRANSPORTATION OF BITUMINOUS MIXTURE :** Transportation from the production plant to the site shall be in trucks having tight, clean, smooth beds lightly coated with an approved releasing agent to prevent adhesion of mixture to truck bodies. Excessive releasing agent shall be drained prior to loading. Each load shall be covered with canvas or other approved material of ample size to protect mixture from weather and prevent loss of heat if directed by the Contracting Officer. Loads that have crusts of cold, unworkable material or have become wet by rain will be rejected. Hauling over freshly placed material will not be permitted.

24. **PLACING :** Bituminous mixtures shall not be placed without ample time to complete spreading and rolling during daylight hours, unless approved satisfactory lighting is provided.

24.1. **Surface Preparation of Underlying Course :** Prior to the placing of intermediate or wearing course, the underlying course shall be cleaned of all foreign or objectionable matter with power brooms and hand brooms.

24.2. **Spraying Contact Surfaces of Structures :** Contact surfaces of previously constructed pavement, curbs, manholes, and similar structures shall be sprayed with a thin coat of bituminous material conforming to the requirements of TACK COAT.

24.3. **Offsetting Joints in Intermediate and Wearing Courses :** The wearing course shall be placed so that the longitudinal joints of the wearing course will be offset from joints in the intermediate course by at least 1 foot. Transverse joints in the wearing course shall be offset by at least 2 feet from the transverse joints in the intermediate course.

24.4. General Requirements for Use of Mechanical Spreader. The range of temperatures of mixtures, when dumped into the mechanical spreader, shall be as determined by the Contracting Officer. Unless otherwise specified, mixtures having temperatures less than 225 degrees F. when dumped into the mechanical spreader will be rejected. The mechanical spreader shall be adjusted and the speed regulated so that the surface of the course being laid will be smooth and continuous without tears and pulls, and of such depth that, when compacted, the surface will conform to the cross section indicated. Placing with respect to centerline areas with crowned sections or high sides of areas with one-way slope shall be as directed. Each lot of material placed shall conform to requirements specified in paragraph ACCEPTABILITY OF WORK. Placing of the mixture shall be as nearly continuous as possible, and the speed of placing shall be adjusted, as directed, to permit proper rolling. When segregation occurs in the mixture during placing, the spreading operation shall be suspended until the cause is determined and corrected.

24.5. Placing Strips Succeeding Initial Strips: In placing each succeeding strip after the initial strip has been spread and compacted as specified below, the screed of the mechanical spreader shall overlap the previously placed strip 2 to 3 inches and be sufficiently high so that compaction produces a smooth dense joint. Mixture placed on the edge of a previously placed strip by the mechanical spreader shall be pushed back to the edge of the strip by the use of a lute. Excess material shall be removed and wasted.

24.6. Handspreading in Lieu of Machine Spreading. In areas where use of machine spreading is impractical, the mixture shall be spread by hand. Spreading shall be in a manner to prevent segregation. The mixture shall be spread uniformly with hot rakes in a loose layer of thickness, that when compacted, will conform to the required grade, density, and thickness.

25. COMPACTION OF MIXTURE. Sufficient rollers (size, type, and number) shall be furnished to obtain the specified compaction. Rolling shall begin as soon after placing as the mixture will bear a roller without undue displacement. Delays in rolling freshly spread mixture will not be permitted. After initial rolling, preliminary tests of crown, grade, and smoothness shall be made by the Contractor. Deficiencies shall be corrected so that the finished course will conform to requirements for grade and smoothness specified herein. Crown, grade, and smoothness will be checked for compliance in each lot of completed pavement by the Contracting Officer and will be evaluated as specified in paragraph ACCEPTABILITY OF WORK.

After the crown, grade, and smoothness requirements have been met, rolling shall be continued until a mat density of 98.0 to 100.0 percent and a joint density of 96.5 to 100.0 percent of density of laboratory-compacted specimens of the same mixture are obtained. The density will be determined and evaluated as specified in paragraph ACCEPTABILITY OF WORK. Places inaccessible to rollers shall be thoroughly compacted with hot hand tampers.

25.1 Testing of Mixture. At the start of plant operation, a quantity of mixture shall be prepared sufficiently to construct a test section at least 50 feet long and two spreader widths wide. Mixture shall be placed, spread, and rolled with the equipment to be used in the project and in accordance with requirements specified above. This test section shall be tested and evaluated as a lot and shall conform to all specified requirements. If test results are satisfactory, the test section shall remain in place as part of the completed pavement. If tests indicate that the pavement does not conform to specification requirements, necessary adjustments to the plant operations and rolling procedures shall be made immediately. Additional test sections, as directed, shall be constructed and sampled for conformance with specification requirements. In no case shall the Contractor start full production of an intermediate or wearing course mixture without approval.

25.2 Correcting Deficient Areas. Mixtures that become contaminated or are defective shall be removed to the full thickness of the course. Edges of the area to be removed shall be cut so that the sides are perpendicular and parallel to the direction of traffic and so that the edges are vertical. Edges shall be sprayed with bituminous materials conforming to BITUMINOUS TACK COAT. Fresh paving mixture shall be placed in the excavated areas in sufficient quantity so that the finished surface will conform to the grade and smoothness requirements. Paving mixture shall be compacted to the density specified herein. Skin patching of an area that has been rolled shall not be permitted.

26 JOINTS

26.1 General. Joints between old and new pavements, or between successive days' work, or joints that have become cold (less than 175 degrees F.) because of any delay shall be made to insure continuous bond between the old and new sections of the course. All joints shall have the same texture and smoothness as other sections of the course. Contact surfaces of previously constructed pavements coated by dust, sand, or other objectionable material shall be cleaned by brushing or shall be cut back as directed. When directed

by the Contracting Officer, the surface against which new material is placed shall be sprayed with a thin, uniform coat of bituminous material conforming to BITUMINOUS TACK COAT. Material shall be applied far enough in advance of the placement of fresh mixture to insure adequate curing. Care shall be taken to prevent damage or contamination of the sprayed surface.

26.2 Transverse Joints : The roller shall pass over the unprotected end of a strip of freshly placed material only when the placing is discontinued or the delivery of the mixture is interrupted to the extent that material in place may become cold. In all cases, prior to continuing placement, the edge of previously placed pavement shall be cut back to expose an even vertical surface for full thickness of the course. In continuing placement of the strip, the mechanical spreader shall be positioned on the transverse joint so that sufficient hot mixture will be spread to obtain a joint after rolling that conforms to the required density and smoothness specified herein.

26.3 Longitudinal Joints : Edges of a previously placed strip shall be prepared such that the pavement in and immediately adjacent to the joint between this strip and the succeeding strip meets the requirements for grade, smoothness, and density as described in paragraph ACCEPTABILITY OF WORK.

2. DESCRIPTION: This work involves placement of an asphalt-rubber treatment on a prepared pavement surface in accordance with the plans and specifications.

2.1 This specification describes two known proprietary processes for production of the treatment hereinafter known as Method A and Method B. Method A uses ground vulcanized rubber and an extender oil whereas Method B uses ground vulcanized rubber and a kerosene diluent. Either method is acceptable based on proper compliance with the specifications and certification of materials.

3. MATERIALS:

3.1 Asphalt Cement: Asphalt cement shall meet the requirements of AASHTO M 20 (Table 1) or M 226 (Table 1 or 3). Acceptable grades for the respective materials will depend on location and circumstances and will require approval of the Supplier of the Asphalt-Rubber. In addition, it shall be fully compatible with the ground rubber proposed for the work as determined by the Supplier.

3.2 Rubber Extender Oil (Method A): Extender oil shall be a resinous, high flash point aromatic hydrocarbon meeting the following test requirements:

Viscosity, SSU, at 100 degrees F. (ASTM D 88)	2500 min.	} ARCO METHOD
Flash Point, COC, degrees F. (ASTM D 92)	390 min.	
Molecular Analysis (ASTM D 2007): Asphaltenes, Wt. % Aromatics, Wt. %	0.1 max. 55.0 min.	

3.3 Kerosene-Type Diluent (Method B). The kerosene-type diluent used shall be compatible with all materials used and shall have a flash point (ASTM D 92) of not less than 80 degrees F. The initial boiling point shall not be less than 300 degrees F with the total distillation (dry point) before 450 degrees F (ASTM D 850). The Contractor is cautioned that a normal kerosene or range oil cut may not be suitable.

3.4 Ground Rubber Components:

3.4.1 For Method A: The rubber shall be a ground tire rubber, recommended by the Supplier for this use and with the approval of the Contracting Officer. The rubber shall meet the following physical and chemical requirements:

3.4.1.1 Two types of rubber shall be blended. Rubber types 1 and 2 shall meet the requirements of Table I with the tests as described by ASTM D 297. The rubbers shall be blended such that the resulting material conforms to the requirements of Table I.

TABLE I. RUBBER REQUIREMENTS

<u>Property</u>	<u>TYPE 1</u>		<u>TYPE 2</u>		<u>BLEND</u>	
	<u>Min.</u>	<u>Max.</u>	<u>Min.</u>	<u>Max.</u>	<u>Min.</u>	<u>Max.</u>
Specific Gravity	1.15	1.17	1.12	1.14	1.14	1.16
Total Extract (%)	14	21	8	12	12	15
Ash (Wt. %)	3.0	6.0	3.8	4.2	4.5	5.5
Free Carbon (Wt. %)	28	32	27	29	27.5	29.5
Total Sulfur (Wt. %)	1.0	1.2	1.0	1.2	1.0	1.2
Rubber Polymer:						
Natural Rubber (Wt. %)	18	32	85	95	50	60
Styrene Butadiene (Wt. %)	58	82	85	95	35	45
Polybutadiene (Wt. %)	0	12	0	0	4	8
Rubber Hydrocarbon (Wt. %)	50	65	50	60	55	65

3.4.1.2. The rubber blend shall be dry and free-flowing, free of wire, fabric, or other contaminants, except up to 4 weight percent of mineral powder may be included to prevent sticking of particles. Rubber constituents and moisture content shall be such that when mixed with asphalt, foaming of the blend does not occur.

3.4.1.3 Sieve Analysis (ASTM C 136)

<u>Sieve</u>	<u>Percent Passing</u>
No. 8	100
No. 30	30-50
No. 50	5-30
No. 100	0-5

3.4.2 For Method B: The rubber shall be a ground tire rubber, 100 percent vulcanized, recommended by the Supplier for this use and with the approval of the Contracting Officer.

3.4.2.1 Composition: The rubber shall comply with the requirements for Type I rubber described in Table I.

3.4.2.2 The rubber shall be dry and free flowing, free from wire, fabric, or other contaminants except up to 4 weight percent of a mineral powder may be included to prevent sticking of the particles. Rubber constituents and moisture content shall be such that when mixed with asphalt, foaming of the blend will not occur.

3.4.2.3 Sieve Analysis (ASTM C 136):

<u>Sieve</u>	<u>Percent Passing</u>
No. 8	100
No. 10	98-100
No. 30	0-10
No. 50	0-2

3.5 Aggregates: Cover aggregates shall be a dry, clean material meeting the requirements of AASHTO M 283 and the additional requirements listed below:

3.5.1 Only crushed stone or slag will be acceptable. Hot or precoated aggregates, if used, will be by special provisions in the documents.

3.5.2 The aggregate shall not contain more than 5 weight percent chert or other known stripping material.

3.5.3 Gradation shall be according to ASTM D 448, Size 7 with the addition that not more than 1 weight percent shall pass the No. 50 sieve.

3.5.4 The aggregate shall be essentially free of deleterious material such as thin elongated pieces, dirt, dust, and shall contain not more than 1 weight percent water (ASTM C566).

3.6 Tack Coat (Methods A and B): The tack coat shall be applied as shown on the plans, in the specifications, or as directed by the Contracting Officer. Application shall be according to materials and methods specified in TACK COATS.

3.7 Certifications and Submittals: Prior to application, the Contractor shall submit certification of specification compliance for all materials to be used in the work. The Contracting Officer reserves the right to sample and test any materials used in the work. Certification shall be submitted concerning the design of the asphalt-rubber blend as follows:

3.7.1 Method A. The Contractor shall submit certification that the asphalt cement is compatible with the rubber and has been tested to determine the quantity of extender oil (usually 1 to 7 weight percent) required and that the proposed percentage will produce an absolute viscosity of the blended materials of 600 to 2,000 poises at 140 degrees F when tested in accordance with the requirements of AASHTO T 202. New certifications will be required if the asphalt cement lot or source of rubber is changed.

3.7.2 Method B. The Contractor shall submit certifications that the asphalt cement is compatible with the rubber. New certifications will be required if the asphalt cement lot or rubber source is changed.

3.7.3 For either method, the Contractor shall submit information (that will vary with location) that shows, to the satisfaction of the Contracting Officer, that the asphalt-rubber and aggregate combination proposed for the project will not be subject to water stripping in the environmental exposure of the project.

4. EQUIPMENT:

4.1 Preblending: Rubber and a portion of the asphalt for the asphalt-rubber blend shall be preblended in a master batch prior to introduction of the master batch to the distributor. The master batch can be diluted with additional asphalt and additives in the distributor to the formulation recommended by the Supplier.

4.2 Distributor : At least one pressure type bituminous distributor in good condition will be required. The distributor shall be equipped so as to be capable of even heating of the material up to 425 degrees F, have adequate pump capacity to maintain a high rate of circulation in the tank; have adequate pressure devices and suitable manifolds to provide constant positive cut-off to prevent dripping from the nozzles. The distributor bar shall be fully circulating with nipples and valves so constructed that they are in such intimate contact with the circulating asphalt that the nipples will not become partially plugged with congealing asphalt upon standing, thereby causing streaked or irregular distribution of the asphalt-rubber.

4.2.1 Any distributor that produces a streaked or irregular distribution of the material shall be promptly removed from the project. Distributor equipment shall include a tachometer, pressure gages, volume measuring devices, and a thermometer for reading temperature of tank contents. The asphalt-rubber sections shall be so constructed that uniform applications may be made at the specified rate per square yard within a tolerance of plus or minus 0.03 gallons per square yard. It is suggested that the distributors used for Method B be equipped with mechanical mixing devices.

4.3 Chip Spreader : A self propelled chip spreader in good condition and of sufficient capacity to apply the aggregate within the time period specified will be required. The spreader shall be so constructed that it can be accurately gauged and set to uniformly distribute the required amount of aggregate at regulated speed.

4.4 Brooms : Revolving and drag brooms shall be so constructed as to sweep clean or redistribute aggregate without damage to the surface.

4.5 Power Rollers : There shall be at least one self-propelled steel wheel roller rated at 5 to 8 tons capacity for each mile or fraction thereof of 12-foot wide surfacing or interlayer applied per day. The rollers shall have a weight of not less than 200 pounds to the lineal inch of drum.

4.6 Pneumatic Tire Rollers : There shall be at least three multiple wheel pneumatic self-propelled rollers with provisions for loading to at least 8 tons and at a tire inflation pressure as required by the Contracting Officer with a minimum 3,000 pounds per wheel.

4.7 Trucks : Trucks of sufficient number and size to adequately supply the material will be required. Trucks shall be properly equipped for use with the chip spreader.

4.8 Municipal Type Street Sweeper : If the Contractor intends to put traffic on the asphalt-rubber surface treatment or interlayer, it may be necessary to sweep the surface with a Municipal Type Street Sweeper to pick up and remove stone and dust lodged in the surface prior to further applications of paving materials onto the asphalt-rubber.

5. CONSTRUCTION DETAILS :

5.1 Preparation of Binder, Method A

5.1.1 Preparation of Asphalt-Extender Oil Mix Blend : Blend the preheated asphalt cement (250 to 400 degrees F), and sufficient rubber extender oil (1 to 7 weight percent) to reduce the viscosity of the asphalt cement-extender oil blend to within the specified viscosity range. Mixing shall be thorough by recirculation, mechanical stirring, air agitation, or other appropriate means. A minimum of 400 gallons of the asphalt cement-extender oil blend shall be prepared before introduction of the rubber.

5.1.2 Preparation of Asphalt-Rubber Binder : The asphalt-extender oil blend shall be heated to within the range of 350 to 425 degrees F. The asphalt-rubber blend for the master batch shall be preblended in appropriate preblending equipment, as specified by the Supplier, prior to introduction of the master batch into the distributor. Addition of asphalt cement into the distributor to provide the specified formula shall be as directed by the Supplier. The percentage of rubber shall be 20 to 24 weight percent of the total blend as specified by the Supplier. Recirculation shall continue for a minimum of 30 minutes after all the rubber is incorporated to insure proper mixing and dispersion. Sufficient heat shall be applied to maintain the temperature of the blend between 375 and 425 degrees F while mixing. Viscosity of the asphalt-rubber shall be less than 4,000 centipoises at the time of application (ASTM D 2994 with the use of a Haake type viscometer allowed in lieu of a Brookfield Model LVF or LVT if desired).

5.2 Preparation of Binder, Method B :

5.2.1 Preparation of the Asphalt-Rubber Blend - Mixing : The asphalt cement shall be preheated to within the range of 350 to 450 degrees F. The asphalt-rubber blend for the master batch shall be preblended in appropriate preblending equipment as specified by the Supplier prior to introduction of the master batch into the distributor. Addition of asphalt cement and diluent into the distributor to provide the specified formula shall be as directed by the Supplier. The percentage of rubber shall be 20 to 24 weight percent of the total asphalt-rubber mixture (including diluent). Mixing and recirculation

shall continue until the consistency of the mixture approaches that of a semi-fluid material (i.e., reaction is complete). At the lower temperature, it will require approximately 30 minutes for the reaction to take place after the start of the addition of rubber. At the higher temperature, the reaction will take place within approximately 5 minutes; therefore, the temperature used will depend on the type of application and the methods used by the Contractor. Viscosity of the asphalt-rubber shall be less than 4,000 centipoises at the time of application (ASTM D 2994 with the use of a Haake type viscometer allowed in lieu of a Brookfield Model LVF or LVT if desired). After reaching the proper consistency, application shall proceed immediately.

5.2.2 Adjustment to Spraying Viscosity With Diluent : After the full reaction described in Preparation of Binder, Method A, above has occurred, the mixture can be diluted with a kerosene type diluent. The amount of diluent used shall be less than 7.5 percent by volume of the hot asphalt-rubber composition as required for adjusting viscosity for spraying or better wetting of the cover aggregate. Temperature of the hot composition shall not exceed the kerosene initial boiling point at the time of adding the diluent.

5.3 Job Delays : Prior to preparation or use of asphalt-rubber (Prepared by either Method A or B), maximum holdover times due to job delays (time of application after completion of reaction) to be allowed will be agreed upon between the Contractor, Supplier, and the Contracting Officer. However, holdover times in excess of 16 hours will not be allowed at temperatures above 290 degrees F. Retempering by the addition of heat, asphalt, or diluents (kerosene/extender oil) will be allowed with approval of the Contracting Officer.

5.4 Seasonal and Weather Limitations : Placement of the asphalt-rubber surface treatment or interlayer shall be made only under the following conditions :

5.4.1 Ambient air temperature is above 60 degrees F and rising.

5.4.2 The surface to receive the asphalt-rubber is absolutely dry.

5.4.3 Wind conditions are such that a satisfactory membrane application can be achieved.

5.5 Preparation of Surface : Prior to the hot asphalt-rubber application, the entire surface to be treated shall be cleaned as required by sweeping, blowing, and other methods until all dust, mud, clay lumps, and foreign material are removed entirely from the area. Patching may be required. No moisture should be present on the surface to receive the asphalt-rubber application. After cleaning and patching, the surface shall receive a tack coat if required by the Contracting Officer.

5.6 Application of Binder : The material shall be applied at a temperature of 375 to 425 degrees F for Method A and 290 to 350 degrees F for Method B at a rate specified by the Contracting Officer, generally 0.35 to 0.65 gallons per square yard. No shot shall be in excess of a length which can be immediately covered with aggregate. The Contractor is reminded that traffic in the adjacent lane must be protected from oil, stone, and sweepings. Application width may have to be adjusted to protect this traffic.

5.6.1 The application from the distributor shall be stopped when the tank contains less than 300 gallons of blended asphalt-rubber. At all startings, which shall include joints from preceding applications, intersections, and at junctions with all pavements, etc., a proper junction shall be made to insure that the distributor nozzles are operating at full force when the application begins. Building paper or other suitable devices shall be used to receive the initial application from the nozzles before any material reaches the surface at the joint. The paper or device shall be removed immediately after use without spilling surplus material on the surface. During application of binder, the Contractor shall provide adequate protection to prevent marring or discoloration of pavement, structures, curbs, trees, etc., adjacent to the area being treated.

5.6.2 Longitudinal joints shall be reasonably true to line and parallel to the centerline. Overlap in the application of the binder shall be the minimum to assure complete coverage. Where any construction joint occurs, the treatment of the edges shall be blended so there are no gaps and the elevations are the same and free from ridges and depressions.

5.6.3 When the application of binder is less than the full width of treatment, the aggregates shall be spread only to within 8 inches of the edge of the next application until the binder is applied to the adjacent width. Between shots no substantial quantity of binder shall remain in the spray bars or nozzles.

5.7 Application of Cover Aggregate : The application of aggregate shall follow immediately after the application of binder. The hot application of binder shall not be made further in advance of the spreading of the cover aggregate than can be covered immediately. The distributor and the aggregate spreader shall not be separated by more than 150 feet. Spreading of the aggregate shall be done directly from approved spreaders. Trucks and spreaders shall not drive on the uncovered binder.

5.7.1 The dry aggregate shall be spread uniformly to cover the binder with an amount of mineral aggregate such that no more than one layer of mineral aggregate is applied, this quantity is generally 25 to 40 pounds per square yard but will be as directed by the Contracting Officer. Any deficient areas shall be covered by additional material immediately.

5.7.2 The entire application of cover material shall be rolled as soon as possible after application. Rolling shall continue to be repeated as often as necessary to key cover material thoroughly into the binder over the entire surface. Pneumatic tire rollers (and steel wheel rollers, if directed by the Contracting Officer) shall be used in the sequence and combination which will provide the rolling pattern that results in the best adhesion of the aggregate to the binder and best surface qualities.

5.7.3 Subsequent to the initial application and rolling of cover aggregate the Contractor shall distribute, as many times as is deemed to be necessary, any loose cover aggregate over the surface to absorb any free binder and cover any area deficient in cover aggregate. Immediately following each such distribution, the Contractor shall roll, with pneumatic rollers, the entire surface treatment or membrane interlayer until the maximum amount of aggregate is embedded in the binder. Such rolling in each case shall not be less than one complete coverage or as many additional coverages as is deemed necessary to properly embed and seat the aggregate. All such rolling shall be performed while the temperature is favorable for seating the aggregate into the binder.

5.7.4 In no case shall there be less than 3 complete coverages with pneumatic tired rollers of the entire surface of the treatment after initial placement.

5.7.5 When the Contracting Officer has determined that the maximum amount of cover aggregate has been embedded, the Contractor shall sweep or otherwise remove all loose material from the entire surface at such time and in such a manner as will not displace any embedded aggregate

5.7.6 The completed asphalt-rubber surface treatment or interlayer shall be allowed to cure for a minimum period as directed by the Contracting Officer prior to paving any final overlays. Traffic will not be permitted on the asphalt-rubber surface treatment or interlayer until it has cured and the embedded cover aggregates are tightly bound into the surface such that they will not be dislodged by traffic.

6. METHOD OF MEASUREMENT : The asphalt-rubber surface treatment or interlayer will be measured by the number of square yards of compacted material in place.

7. BASIS OF PAYMENT : The unit price bid per square yard shall include the cost of furnishing all material, all labor and equipment necessary to complete the work. Payment for patching material and tack coat will be made under the appropriate bid items.

SECTION B-3

POLYMER MODIFIED ASPHALT-RUBBER SURFACE TREATMENT OR INTERLAYER

- 1 APPLICABLE PUBLICATIONS
- 2 DESCRIPTION
- 3 MATERIALS
- 4 METHOD OF MEASUREMENT
- 5 BASIS OF PAYMENT

1. APPLICABLE PUBLICATIONS : The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

- 1.1 American Society for Testing and Materials (ASTM) Publications.

D 36-76	Softening Point of Bitumen (Ring and Ball Apparatus)
D 113-79	Ductility of Bituminous Materials
D 3407-78	Joint Sealants, Hot-Poured, for Concrete and Asphalt Pavements

2. DESCRIPTION : This work involves placement of a polymer modified asphalt-rubber treatment on a prepared pavement surface in accordance with the plans and other specifications.

2.1 This specification incorporates all sections of the specification ASPHALT-RUBBER SURFACE TREATMENT OR INTERLAYER (SECTION D-2) with modifications and amendments that follow.

3. MATERIALS : Materials will comply with the requirements of the above referenced specification, Method B, with the following modifications:

3.1 Composition: The composition of the mixture shall be as follows (Weight percent of the mixture)

Asphalt Cement	80 ± 1 percent
Ground Vulcanized Rubber	17 ± 1 percent
Polymer Modifier	3 ± 0.5 percent *

* The polymer modifier additive shall be as selected by the Supplier of the asphalt-rubber to provide the required mixture properties with approval of the Contracting Officer.

3.2 The modified asphalt-rubber when mixed and reacted at 350 degrees F for 1 hour shall have the following properties:

<u>Properties</u>	<u>Limits</u>	<u>Test Method</u>
Viscosity, 350 degrees F, centipoises	1500-4000	**
Softening Point, degrees F	140 min	ASTM D 36
Ductility, 77 degrees F, 5 cm./min., centimeters	20 min	ASTM D 113
Ductility, 39.2 degrees F, 1 cm./min., centimeters	15 min	ASTM D 113
Resilience, 77 degrees F, percent	15 min	ASTM D 3407

** Haake Rotational Viscometer (5.2.1, Referenced Specification).

3.3 Certification and Submittals: Prior to application, the Contractor shall submit certification of specification compliance for all materials to be used in the work. The Contracting Officer reserves the right to sample and test any materials in the work. Certification shall be submitted concerning the design of the modified asphalt-rubber blend as follows.

3.3.1 The Contractor shall submit certifications that the modified asphalt cement is compatible with the rubber. New certifications will be required if the asphalt cement lot or rubber source is changed.

3.3.2 The Contractor shall submit information that shows, to the satisfaction of the Contracting Officer, that the modified asphalt-rubber and aggregate combination proposed for the project will not be subject to water stripping in the environmental exposure of the project.

4. METHOD OF MEASUREMENT : The modified asphalt-rubber surface treatment or interlayer will be measured by the number of square yards of compacted material in place.

5. BASIS OF PAYMENT : The unit price bid per square yard shall include the cost of furnishing all material, all labor and equipment necessary to complete the work. Payment for patching material and tack coat will be made under the appropriate bid items.

**SPECIAL PROVISION FOR ASPHALT-RUBBER AND
MODIFIED ASPHALT-RUBBER SURFACE TREATMENTS
AND INTERLAYERS**

1. SPECIFICATION AFFECTED : Section D-2 , ASPHALT-RUBBER SURFACE TREATMENT OR INTERLAYER and Section D-2, POLYMER MODIFIED ASPHALT-RUBBER SURFACE TREATMENT OR INTERLAYER.

2. AFFECTED SECTION : 3.5.3 (Gradation). The specification shall be superseded to read, "Gradation for this project shall be developed by the Contracting Officer and provided to the Contractor at least 30 days prior to placement of the asphalt-rubber or polymer modified asphalt-rubber".

- END -

SECTION B-4

RUBBER FILLED ASPHALT CONCRETE

1. APPLICABLE PUBLICATIONS
2. GENERAL
3. JOB-MIX FORMULA
4. GRANULATED RUBBER
5. AGGREGATES
6. MINERAL FILLER
7. ASPHALT
8. CONSTRUCTION
9. MEASUREMENT AND PAYMENT

1. APPLICABLE PUBLICATIONS : The Publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only

1.1 American Society for Testing and Materials (ASTM) Publications :

C 136-83 Sieve Analysis of Fine and Coarse Aggregates

D 2041-78 Theoretical Maximum Specific Gravity of Bituminous Paving Mixtures.

2. GENERAL : This work shall consist of furnishing and placing Rubber Filled Asphalt Concrete. This material is a rubber modified asphalt concrete which is a mixture of granulated rubber, asphalt cement, and a mineral aggregate, in accordance with these specifications and in reasonably close conformity with the lines, grades, thicknesses, and details shown on the plans or as established by the Contracting Officer.

2.1 Attention is directed to paragraph 5, AGGREGATES, of these specifications. The aggregate gradations are coarse and gap graded, which generally requires addition of a mineral filler to meet the gradation requirements. Rubber filled asphalt concrete is produced and placed with standard equipment. However, a system must be provided for introduction of the granulated rubber and required mineral filler. The system incorporated into the test sections of this project use a patented process and work will be under license agreement with

All Seasons Surfacing Corporation
2281 116th Avenue N.E., Suite 2 (Telephone 206-454-3830)
Bellevue, Washington 98004-3015

The Contractor will be responsible for acquiring all licence agreements for the use of this material for this project.

3. JOB-MIX FORMULA (JMF) : After a representative quantity of aggregate has been produced and not less than 15 calendar days before production of the rubber filled asphalt concrete mixture begins, the Contractor shall submit to the Contracting Officer a proposed job-mix formula for approval. Representative samples of the stockpiled aggregates, asphalt, and rubber shall be taken and a final job-mix formula established by the Contracting Officer, based on laboratory design procedures approved by the licensor. Note that conventional mixture design procedures have not been found effective for the design of rubber filled asphalt concretes. The mixture design procedure for developing the job-mix formula will require approval of the Contracting Officer

3.1 The job-mix formula shall include definite single values for :

- A. The percentage of aggregate passing each specified sieve based on the dry weight of the total aggregate.
- B. The percentage of asphalt to be added based on the total weight of mixture of rubber filled asphalt concrete.
- C. The granulated rubber percentage shall be 3 percent based on the total weight of mixture of rubber filled asphalt concrete

3.2 In addition to the aggregate sample(s) furnished above, the Contractor shall furnish the Contracting Officer with 1 gallon of the proposed asphalt cement and 10 pounds of the granulated rubber meeting the requirements of the following paragraphs.

3.3 Should a change of any materials be found necessary, a new job-mix formula will be required to be established in the same manner as described previously.

3.4 All rubber filled asphalt concrete mixture furnished shall conform to the job-mix formula within the following range of tolerances:

<u>Sieve Size</u> <u>(ASTM C 136)</u>	<u>Percent Passing</u>
3/8 or 1/4 in.	JMF $\pm$ 6
No. 10 or No. 30	JMF $\pm$ 4
No. 200	JMF $\pm$ 0.5

<u>Other Constituents</u>	<u>Range</u>
Asphalt Cement	JMF $\pm$ 0.4 percent
Granulated Rubber	JMF $\pm$ 0.15 percent *

* Not determinable by conventional extraction testing

4. GRANULATED RUBBER: The granulated rubber shall be ground from whole passenger car or truck tires only. Heavy equipment tires or other non-automotive rubber shall not be used.

4.1 The rubber shall be cubical or thread-shaped and individual rubber particles, irrespective of diameter, shall not be greater in length than 5/16 inch. The granulated rubber shall conform to the following gradation requirements (ASTM C 136):

<u>Sieve Size</u>	<u>Percent Passing</u>
1/4 in.	100
No. 4	76-100
No. 10	28-42
No. 20	16-24

4.2 Maximum allowable moisture content is 2 percent by weight of rubber.

4.3 The Contractor shall furnish written certification of compliance with these specifications. In addition, each delivery shall be sampled at the rate of not less than 1 sample for each 20 tons of rubber and a dry sieve analysis performed to insure that the rubber granules meet gradation and size requirements. The sampling and testing must be completed and the rubber approved for use by the Contracting Officer before any delivery is incorporated into the rubber filled asphalt concrete.

5. AGGREGATES : Aggregates shall conform to the requirements in Section 3A, BITUMINOUS INTERMEDIATE AND WEARING COURSES FOR AIRFIELDS, HELIPORTS, AND HEAVY DUTY PAVEMENTS (CENTRAL-PLANT HOT-MIX).

5.1 Gradation Requirements (ASTM C 136)

Sieve Size	Percent Passing		
	Gradation 8	Gradation 12	Gradation 16
3/4"			100
5/8"		100	--
3/8"	100	60-80	50-62
1/4"	60-80	30-44	30-44
No. 10	23-38	20-32	20-32
No. 30	15-27	13-25	12-23
No. 200	8-12	8-12	7-11

5.1.1 The rubber filled asphalt concrete must be gap graded to allow space for the rubber granules. For gradation 12 and 16 mixtures, this gap grade is defined by restricting the amount of aggregate passing the 1/4 inch sieve and retained on the No. 10 sieve to be 12 percent plus or minus 4 percent.

5.2 Before being fed to the dryer, the aggregate shall be separated into 2 or more sizes and stored separately. Sizing of the separated material shall be with the approval of the Contracting Officer. In placing aggregate into storage or in moving from storage to cold feed bins, any method that causes segregation, degradation, or the combining of materials of different gradings shall not be permitted. Any segregated, degraded, or contaminated material shall be rescreened or wasted.

6. MINERAL FILLER: A mineral filler is usually required to meet the minus No. 200 gradation requirements. The Contractor shall submit a representative sample of the mineral filler material to the Contracting Officer for approval and use in establishing the final job-mix formula. The plant shall be equipped to feed the mineral filler into the mixer with a precision of plus or minus 0.5 percent of the job-mix formula requirement.

7. ASPHALT: Asphalt type and grade shall be the same material specified in Section 3A, BITUMINOUS INTERMEDIATE AND WEARING COURSES FOR AIRFIELDS, HELIPORTS, AND HEAVY DUTY PAVEMENTS (CENTRAL-PLANT HOT-MIX).

7.1 The asphalt content (percent by total weight of rubber filled asphalt concrete) shall be within the following ranges:

<u>Gradation 8</u>	<u>Gradation 12</u>	<u>Gradation 16</u>
8.0 - 9.5	7.5 - 9.0	7.5 - 9.0

Actual asphalt content will be determined by the mixture design.

8. CONSTRUCTION:

8.1 Bituminous Mixing Plants: Mixing plants shall conform to the standard requirements found in Section 3A, BITUMINOUS INTERMEDIATE AND WEARING COURSES FOR AIRFIELDS, HELIPORTS, AND HEAVY DUTY PAVEMENTS (CENTRAL-PLANT HOT-MIX), except that the following shall be added:

8.1.1 Requirements for Batch Plants: The amount of granulated rubber incorporated into the rubber filled asphalt concrete shall be determined by weighing on springless dial scales, or by a method which uniformly feeds the mixer within plus or minus 0.15 percent of the required amount indicated in paragraph JOB-MIX FORMULA. Bags of granulated rubber may be used for proportioning provided the batch size is adjusted to use the entire bag of rubber. No partial bags will be allowed.

8.1.2 Requirements for Drum Mixing Plants: Granulated rubber introduced into the mixer shall be drawn from storage bins by a continuous mechanical feeder which will uniformly feed the mixer within plus or minus 0.15 percent of the required amount indicated in paragraph JOB-MIX FORMULA. The continuous feed system shall have a ready means of

accurately calibrating the system. A means satisfactory to the Contracting Officer shall be provided to insure positive interlocking control between the flow of the granulated rubber and aggregates introduced into the rubber filled asphalt concrete. The plant shall be equipped with a heat shield or other means satisfactory to the Contracting Officer to prevent direct contact of the open flame and rubber.

8.2 Mixing: The Contractor shall prepare a work plan describing the planned procedures for mixing and placing the material. The plan shall include such details as the method of introducing the rubber granules into the mixture, mixing times, temperatures, and other equipment for production of the rubber filled asphalt concrete.

8.2.1 The plant shall be calibrated to produce the required composition of asphalt, rubber, aggregate, and mineral filler. Aggregate samples shall be taken in a manner satisfactory to the Contracting Officer to verify that the mixture is within the combined aggregate gradation specifications before beginning job-mix production.

8.2.2 Standard mixing procedures as found in Section 3A, BITUMINOUS INTERMEDIATE AND WEARING COURSES FOR AIRFIELDS, HELIPORTS, AND HEAVY-DUTY PAVEMENTS (CENTRAL-PLANT HOT-MIX) shall apply except as follows:

8.2.2.1 For batch plants, aggregates and granulated rubber shall be combined and mixed thoroughly for a minimum of 15 seconds prior to the introduction of asphalt. The asphalt, aggregates, and rubber granules shall be mixed so as to achieve a uniform distribution of all materials and coating of the aggregate and granulated rubber.

8.2.2.2 The completed mixture shall conform to the job-mix formula within the requirements of paragraph JOB-MIX FORMULA. If the mixture is outside the tolerance limits for 2 consecutive samples, a plant and/or aggregate adjustment must be made to bring the mixture within the specified tolerance limits.

8.2.2.3 The temperature at mixing shall be between 325 and 375 degrees F. The temperature of the mixture at discharge shall be above 300 degrees F for both batch and drum mixing plants.

8.3 Hauling, Spreading, and Finishing

8.3.1 The standard requirements of Section 3A, BITUMINOUS INTERMEDIATE AND WEARING COURSES FOR AIRPORTS, HELIPORTS, AND HEAVY-DUTY PAVEMENTS (CENTRAL-PLANT HOT-MIX) shall apply. When directed by the Contracting Officer, the mixture shall be covered with appropriate means to prevent rapid cooling of the mixture.

8.3.2 The mixture shall be placed at temperatures of not less than 300 degrees F when measured at the paving machine. Maximum compacted lift thickness shall be 2 inches.

8.3.3 A tack coat shall be applied at a rate of 0.06 to 0.08 gallons per square yard of residual asphalt in accordance with the Section TACK COAT.

8.3.4 The mixture shall be laid upon a surface approved by the Contracting Officer, spread, and struck to grade with a self-propelled asphalt paver conforming to the requirements of Section 3A, BITUMINOUS INTERMEDIATE AND WEARING COURSES FOR AIRPORTS, HELIPORTS, AND HEAVY-DUTY PAVEMENTS (CENTRAL-PLANT HOT-MIX). The mixture shall not be placed when it is raining or on a wet surface, or when the average ground temperature is less than 45 degrees F or when the Contracting Officer determines that weather conditions prevent proper handling or finishing. Where hand placement or raking is required, it shall be done immediately because the mixture becomes stiff and difficult to rake at lowered temperatures. If the mixture is produced by more than 1 asphalt plant, the material produced at each plant shall be placed by separate spreading and compacting equipment.

8.4 Compaction: Rollers and compaction procedures shall conform with the requirements of Section 3A, BITUMINOUS INTERMEDIATE AND WEARING COURSES FOR AIRFIELDS, HELIPORTS, AND HEAVY-DUTY PAVEMENTS (CENTRAL-PLANT HOT-MIX) with the following supplements:

8.4.1 Breakdown compaction shall begin immediately behind the paving machine. However, some delay may be required to prevent roller pickup. The roller drums must be kept well watered and a wetting agent may be necessary to decrease roller pickup.

8.4.2 Breakdown compaction shall be accomplished using a 10 to 12 ton vibrating or static steel wheel roller. An 8 to 10 ton tandem steel roller shall be used for finish rolling. Finish rolling of the mat shall continue

until elastic movement under the roller is no longer observed.

8.4.3 Rolling procedures shall be established with a control strip to determine equipment and number of coverages necessary to obtain required density. The target density, as a percentage of maximum theoretical density (ASTM D 2041) shall be 95 to 98 percent to provide 2 to 5 percent air voids.

9. MEASUREMENT AND PAYMENT : Measurement of rubber filled asphalt concrete shall be by the ton, compacted in place, and will include the granulated rubber, aggregates, mineral filler, asphalt, and other components in the mixture.

9.1 The contract unit price per ton for rubber filled asphalt concrete shall be full compensation for furnishing all labor, equipment, materials, supplies, and royalties or licences required for the construction and placement of this material as specified

POLYPROPYLENE PAVEMENT REINFORCING FABRIC

1. APPLICABLE PUBLICATIONS
2. GENERAL
3. POLYPROPYLENE PAVEMENT REINFORCING FABRIC
4. ASPHALT SEALANT OR BINDER
5. FABRIC HANDLING EQUIPMENT
6. ASPHALT DISTRIBUTOR
7. CONSTRUCTION
8. MEASUREMENT AND PAYMENT

1. APPLICABLE DOCUMENTS : The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

1.1 American Society for Testing and Materials (ASTM) Publications .

D 1682-64 Test Methods for Breaking Load and Elongation of
Textile Fabrics

1.2 American Association of State Highway and Transportation
Officials (AASHTO) Publications .

M 20-70 Penetration Graded Asphalt Cement

M 226-80 Viscosity Graded Asphalt Cement

2. GENERAL : This work shall consist of furnishing and placing a polypropylene pavement reinforcing fabric. This material and an accompanying asphalt sealant binder is to be placed in accordance with these specifications and in reasonably close conformity with the lines, grades, application rates, and details shown on the plans or as established by the Contracting Officer.

3. POLYPROPYLENE PAVEMENT REINFORCING FABRIC : Fabric shall be a 100 percent needle-punched non-woven polypropylene pavement reinforcing fabric which conforms to the following properties based on ASTM D 1682, Method D, Grab Method :

<u>Property</u>	<u>Minimum</u>
Weight, ounces per square yard	3.8
Tensile Strength, pounds	90
Elongation-at-Break, percent	55
Asphalt Retention, gallons per square yard	0.20
Color	Black
Width, inches	75 or 150 (option)
Length per Roll, yards	120

4. ASPHALT SEALANT OR BINDER : Asphalt cement sealant or binder shall conform to AASHTO M 20 (TABLE 1) OR M 226 (TABLE 1 OR 3). Emulsified asphalts can be used with the approval of the Contracting Officer. Grades of asphalt will be determined by the Contracting Officer.

5. FABRIC HANDLING EQUIPMENT : Mechanical laydown equipment shall be capable of handling full rolls of fabric, and shall be capable of laying the fabric smoothly and without excessive wrinkles and/or folds. Specific requirements of the Supplier are included as a part of these specifications

6. ASPHALT DISTRIBUTOR : The distributor must be capable of spraying the asphalt binder at the prescribed temperature and application rate. It must be adjustable to give a uniform spray pattern over the entire width of application. A hydrostatic distributor is preferred. No drilling or skipping is permitted. As directed by the Contracting Officer, preliminary test applications may be required at an off-site area to insure proper distributor and operator performance.

7. CONSTRUCTION :

7.1 Surface Preparation : The surface to receive the polypropylene pavement reinforcing fabric must be free of dirt, water, and vegetation. Cracks or joints between 1/8 and 1/4 inch will be filled with a crack filler approved by the Contracting Officer. Larger cracks, joints, or holes are to be repaired with an approved hot or cold asphalt mixture prior to placement of the polypropylene pavement reinforcing fabric. Leveling courses are a separate item.

7.2 Application of Asphalt Sealant or Binder . The asphalt sealant or binder must be uniformly applied at the rate specified by the Contracting Officer. Quantity specified will vary with porosity of the underlying substrate, but in most cases, will be in the range of 0.25 to 0.30 gallons per square yard residual asphalt. Application must be by distributor as previously specified. Temperature of the asphalt sealant or binder must be sufficiently high to permit a uniform spray pattern. For asphalt cement, the minimum spray temperature is 300 degrees F. For emulsified asphalts, the minimum spray temperature shall conform to the recommendations of the emulsion manufacturer. If emulsified asphalt is used as the binder or sealant, the emulsion must be cured as per recommendations of the fabric Supplier prior to placing the polypropylene pavement reinforcing fabric.

7.3 Fabric Placement . The fabric shall be placed into the asphalt binder or sealant with a minimum of wrinkles. Brooming may be required to maximize fabric contact with the underlying substrate or surface. As directed by the Contracting Officer, if fabric folds exist, the fabric shall be slit and allowed to lay flat. Additional binder may be required to satisfy the double layer. All joints should overlap adjacent fabric by 2 to 6 inches. Transverse joints should be shingled in the direction of paving to prevent edge pickup by the paver. Paving operations should follow directly behind fabric placement under direction of the Contracting Officer. Removal and replacement of polypropylene pavement reinforcing fabric that is damaged for any reason after placement is the responsibility of the Contractor.

8. MEASUREMENT AND PAYMENT : Measurement of polypropylene pavement reinforcing fabric shall be by the square yard, in place, and will include polypropylene pavement reinforcing fabric and asphalt sealant or binder.

8.1 The contract unit price per square yard for polypropylene pavement reinforcing fabric shall be full compensation for furnishing all labor, equipment, materials, supplies, and royalties required for construction of this material as specified.

SECTION B-6

COLD MILLING

1. DESCRIPTION
2. EQUIPMENT
3. CONSTRUCTION REQUIREMENTS
4. METHOD OF MEASUREMENT
5. BASIS OF PAYMENT

1. DESCRIPTION: This work shall consist of cold milling of pavement in accordance with the plans and specifications and as may be directed by the Contracting Officer.

2. EQUIPMENT: The cold milling machine shall be an approved pavement profiler meeting the following minimum criteria:

- A. Power operated
- B. Accurately establish profile grades with a tolerance of $\pm 1/8$ inch by reference from the existing pavement surface or from an independent grade control with cross-slope elevation control.
- C. Capable of cold milling the pavement.
- D. Have an enclosed cutting area with an effective means of dust control

3. CONSTRUCTION REQUIREMENTS

3.1 The existing pavement surface shall be cold milled to the depth, width, and grades as shown on the plans or as established by the Contracting Officer.

3.2 Any adjustment to the plan depth and/or depth established by the Contracting Officer shall be adjusted in 1/4 inch increments. Said increments may be plus or minus and shall be effected whenever and wherever the Contracting Officer deems an adjustment in the work is necessary. The Contracting Officer shall be the sole judge as to said adjustments. The aforementioned adjustment(s) will be made to the established profile grades from the existing pavement surface or from an independent grade control with cross-slope elevation control.

3.3 Excessive grooving by cold milling will not be permitted

3.3.1 Excessive grooving for all intents and purposes of these specifications is defined as a variation in the milled surface in excess of 1/2 inch from the high point to the low point across the width of the cutting head of the milling machine. Measurement shall be made to the bottom of the groove from a straightedge or cutting stringline datum plane

3.3.2 When excess grooving occurs, cold milling operations shall cease and the cold milling equipment corrected. Prior to resuming cold milling operations, all nonconforming work shall be corrected to the satisfaction of the Contracting Officer at no additional cost to the Government.

3.3.3 The pavement material emanating from the cold milling operation shall be removed and disposed of as directed by the Contracting Officer.

3.4 This project requires that all longitudinal and transverse surfaces (edges) be milled in such a manner that a slope or bevel of 3 inches vertically to 6 feet horizontally for 6 feet horizontally be prepared to allow passage of aircraft across the milled surface after milling is complete as part of this specification.

4.5 After milling, all loose material that could cause foreign object damage (FOD) shall be removed to the satisfaction of the Contracting Officer. Hand removal and brooming may be necessary

4. METHOD OF MEASUREMENT : Cold milling of existing pavement surfaces will be measured by the square yard inch. A square yard inch is defined as one square yard by one inch deep for purposes of these specifications

5. BASIS OF PAYMENT : The unit price bid per square yard inch shall be full compensation for removing of the cold milled pavement surface material and hauling said material a maximum of five miles for disposal and for furnishing all equipment, tools, labor, materials, and incidentals necessary to complete the work provided herein
