19. ABSTRACT (Continue on reverse if necessary and identify by block number) This final report describes and provides the data on the reduced voltage (108 VAC) and restart testing of the 1-Watt Integral Stirling Cooler. The 1-Watt Integral Cooler (HD-1033B/C/D) is currently used in the M1 FLIR, M60 FLIR, and the Advanced Attack Helicopter FLIR. The cooler specification requires that the cooler operate from 115 to 119 VAC. Because of the potential of lower voltage operation in some systems, C ² NVEO evaluated the cooler performance and restartability at environmental extremes with 108 VAC. The coolers successfully passed all testing at all environmental conditions using both voltages.

SECTION I. PURPOSE

The CECOM Center for Night Vision and Electro-Optics (C²NVEO) is responsible for developing cryogenic coolers for all infrared (IR) imaging systems for the Army. C²NVEO also maintains configuration management control of the Forward Looking Infrared (FLIR) Common Module coolers used in thermal imagers in fielded Army weapon systems such as the M60A3 and M1 Tanks, the Bradley Fighting Vehicle System, the TOW Missile System, and the Army Attack Helicopter. There are currently over 30,000 coolers in fielded systems and several thousand more are added each year. C²NVEO conducts development programs and monitors contractor internal research and development efforts to improve cooler performance such as reliability, audio noise, power consumption, and output vibration.

The 1-Watt Integral (HD-1033B/C/D) specifications require that the cooler input voltage be 117 +/- 2 volts (V) alternating current (AC) and 400 +/- 20 hertz (Hz). Because of a conflict between the cooler specifications and the aircraft power requirements, it was requested by the Program Manager, Advanced Attack Helicopter, that the C²NVEO resolve the differences in the power requirements. Specifically, the lowest input voltage that may be supplied to the cooler from the TADS/PNVIS system is 108 VAC. The purpose of the testing was to evaluate the cooler performance and restart capability when operated at the lower input voltage of 108 VAC at various temperatures. In order to compare test results, all the coolers were also tested at an input voltage of 117 VAC.

SECTION II. DESCRIPTION

The reduced voltage testing was conducted on six 1-Watt Integral Coolers which were mated to DT-594 detector/dewars. Three of the coolers tested were AEG HD-1033C coolers, two were CTI HD-1033C coolers, and the last unit was a CTI clearance seal unit (HD-1033D). The evaluation consisted of subjecting the cooler/dewar assemblies to low (-54°C), high (+71°C), and room (+24°C) temperature performance and restart testing while the coolers were operated at 108 and 117 VAC. The performance testing consisted of allowing the assemblies to stabilize at the appropriate temperature and then running the units for 20-minutes. During the 20 minute period, a cooldown check was performed and the input power and detector temperature were monitored (Appendix A). The restart testing was comprised of stabilizing the assemblies to the necessary temperature. Once stabilized, the coolers were operated until the detector temperature reached 75K, at which time the power was cut off and then resupplied within 2 seconds. This sequence was repeated an additional four times (Appendix B).

SECTION III. SUMMARY

The six coolers tested showed negligible or no degradation in performance when operated at 108 VAC over the operating temperature requirements of the military specifications (-54°C to 71°C). In all cases, the cooler adequately cooled down the detector in the allotted time, maintained the detector temperature under 80K, and restarted every time power was cut off and then reapplied within 2 seconds. A summary of all the coolers' data is provided in the following table. Appendix A contains all the performance data from the testing and Appendix B contains the restart data. Based on the test results, C²NVEO will modify the HD-1033C specification and HD-1033D Purchase Description to be compatible with the TADS/PNVIS system power values.

Summary of Test Results

Cooler	/ Dewar	Requirement	117 volt 24°C	108 volt 24°C	117 volt -54°C	108 volt -54°C	117 volt +71°C	108 volt +71°C
