CONDITIONS OF RELEASE

A

1. This information is released by the UK Government to the recipient Government for defence purposes only.
2. This information must be accorded the same degree of security protection as that accorded thereto by the UK Government.
3. This information may be disclosed only within the Defence Departments of the recipient Government and to its Defence Contractors within its own territory, except as otherwise authorised by the Ministry of Defence. Such recipients shall be required to accept the information on the same conditions as that recipient Government.
4. This information may be subject to privately owned rights.

CONDITIONS OF RELEASE

B

1. This information is released by the UK Government to the recipient Government for defence purposes only.
2. This information must be accorded the same degree of security protection as that accorded thereto by the UK Government.
3. This information may be disclosed only within the Defence Departments of the recipient Government and to those noted in the attached list, except as otherwise authorised by the Ministry of Defence. Such recipients shall be required to accept the information on the same conditions as the recipient Government.
4. This information may be subject to privately owned rights.

CONDITIONS OF RELEASE

C

1. This information is released by the UK Government to the recipient Government for defence purposes only.
2. This information must be accorded the same degree of security protection as that accorded thereto by the UK Government.
3. This information may be disclosed only within the Defence Departments of the recipient Government, except as otherwise authorised by the Ministry of Defence.
4. This information may be subject to privately owned rights.

CONDITIONS OF RELEASE

D

1. This information is released for information only and it is to be treated as disclosed in confidence. The recipient Government shall use its best endeavours to ensure that this information is not dealt with in any manner likely to prejudice the rights of any owners thereof to obtain patent or other statutory protection therefor.
2. Before any use is made of this information for the purpose of manufacture the authorisation of the Ministry of Defence (Navy Department) must be obtained.

A Computer Graphics Package

ABSTRACT

1. A general purpose graphics package is described. The package is an updated version of a graphics library first developed in 1969 on an ICL-1900 series computer (described in AUWE Acc 35647) and in use continuously since that time with various modifications and informal documentation improvements. It is currently implemented on a DEC-MicroVAX computer and various hardware devices including the HP series of plotters (using HPGL), Regis devices (VT125, VT340), DEC Workstation, LN03 laser printer, and certain Ramtek, Sigma and Tektronix devices.

2. Although commercial graphics packages are available this one is simple to understand and use, and together with its familiarity to existing users continues to provide useful graphics support.

3. Examples are given in order to clarify usage of the software and lists of subroutines are also provided.

1 BACKGROUND

1.1 Recent advances in computer technology and software have dramatically changed the computing scene. Before WIMPs computers were used mainly by skilled operators or in rather dedicated applications. Not so long ago suitable software for a particular application was unlikely to be available and computer applications relied on special purpose software being developed.

1.2 In scientific research printed output soon acquired a low reputation. Computer solutions to complex problems frequently produced vast quantities of printed numbers and data was transcribed to graphical form by hand. The graph package described here was first developed in about 1969 (ref: AUWE Acc 35647) for use with a Computer Instrumentation Ltd incremental plotter. Under computer control this machine could do nothing more than move the pen one increment in one of eight directions or raise or lower the pen. Because it was such a basic machine, software was developed so that scientific applications could produce good quality graphics. Features included font designs with rounded characters (unlike the poor quality angular characters which were available), text scaling and rotation, curve fitting to allow cusps to be drawn automatically, and indeed most of the basic features currently available. The package has served the needs of scientific graph plotting for many years and is still in use, including descendant versions adapted by various users at ARE.

1.3 Computer graphics has become a very important and sophisticated subject but has many different applications, including computer art and simulation. Even scientific applications may involve complicated graphics which are not suitable for general purpose use. Sophisticated graph packages are now commercially available and have the advantage of providing a commercially maintained standard, such as GKS. However, this package continues to be attractive because it is simple to use, it is familiar and can be easily modified or extended to cater for different applications or new hardware.

1.4 This report marks a new generation of the software for compatibility with the window environment of a VAX Workstation. Some changes have been incorporated but these have minor implications for existing programs and mainly deal with the Workstation aspects and additional routines.

2 INTRODUCTION

2.1 In scientific research graphical output from computer programs is essential and can be easily obtained using the subroutines described. This graphics package provides comprehensive facilities for two and three dimensional work and is largely device independent. The subroutines can be considered in three groups as follows:

(a) The main routines which actually create a picture;
(b) The supporting routines which modify the actual behaviour of the main routines;
(c) Device dependent routines which are not normally used directly by the application but are available if required;
(d) Special routines which are not intended for general use.

2.2 For simplicity, parameter lists have been kept to a minimum, and consequently the action of the main drawing subroutines depends on 'hidden' parameter values. These hidden parameters are given default values, but may be adjusted by means of the supporting subroutines. For example the subroutine PLOT_TEXT('text',N) plots text using the default character size, but this may be changed by the supporting subroutine CHAR_SIZE(Width,Height).

3 COORDINATE SYSTEMS

3.1 Assume a world cartesian coordinate system (X,Y) is defined on some imaginary drawing surface such as an A4 sheet of paper with its origin at the lower left hand corner and the X-axis horizontal. The units of both X and Y are *mm*. A local cartesian coordinate system (U,V) may be defined with its origin at X=Xshift, Y=Yshift (see ORIGIN) and scaled such that one unit of U is Xscale mm., and similarly for Y (see SCALE). Thus:

```
X = U*Xscale+Xshift mm.
Y = V*Yscale+Yshift mm.
```

3.2 Initially these two systems (world and local) are identical and mapped to the actual display device assuming the drawing surface is A4 landscape in size and orientation. With an HP7750 plotter for example the mapping is to true scale, but on a VT340 some additional scaling is necessary in order to represent the A4 size on the screen. For simple applications it is useful to imagine the graphical output is to be produced on an A4 sheet of paper in landscape or portrait orientation. However, the routine PLOT_WINDOW enables the world coordinate system to be modified and PLOT_VIEW modifies how the world coordinates are mapped to the physical display device, thus enabling large graphics surfaces to be created. Workstation graphics may create up to 4 virtual displays with 4 windows in each. Although mapping a graph to a display device is defined in terms of a window to a virtual display and a viewport on the device, the full windows environment is not supported on some devices.

3.3 Valid physical graphics devices are recognised by the following mnemonics:

GF	A pseudo device which saves a file copy of the graphics output.
RG	A Ramtek series 9000
VG	A VT340 (or VT125 with some restrictions)
WG	A Workstation with UIS support
HP	A Hewlett Packard plotter recognising HPGL

Any hardware combinations can specified by means of these mnemonics and additionally the mnemonic TT can be used to represent either VG or WG determined by the login device. By default the software automatically selects the appropriate display device you are logged in to (if it is recognised as a valid graphics device) and a hard copy file is produced (See PLOT_INIT). A keyboard and cursor is associated with the first interactive device selected.

3.4 Special facilities exist for 3D plotting and are described in greater detail later.

4 DEFAULT CONDITIONS

4.1 Initialisation (see PLOT_INIT) resets certain parameters to default values as follows:

ORIGIN	0.	0.
SCALE	1.	1.
CHAR_SIZE	2.4	3.0
CHAR_ANGLE	0.0	
CHAR_SLOPE	0.0	
LINE_TYPE	0	0.0
SELECT_PEN	1	
MOVE	0.	0.

Various other parameters are reset by device specific initialisation routines (see DEVICE SPECIFIC SUBROUTINES).

5 SUBROUTINE DESCRIPTIONS

5.1 Since the various graphics devices have different capabilities, it is not always possible to ensure that general purpose routines behave identically on the different devices. In particular, character drawing will be subject to resolution differences. Consequently, it may be necessary to make some compromise over the style of graph for a given device. Alternatively different devices may be turned off and on to allow different text styles to be used. However, the following general purpose routines provide a high level of device independence, where the parameter type specifications are INTEGER*4 (if starting with the letters I,J,K,L,M,N) or REAL*4 or as specified in the description:

A4_BOX(I)
Draw corner marks to define an A4 box. If I>=0 the long side is horizontal, if I<0 the long side is vertical.

AXIS_LIN(X0,Y0,X1,Y1,SD,D,P)
Draw a linear type axis from (X0,Y0) to (X1,Y1), with distance D between tick marks which are of height P(mm.). The starting position through the sequence is given by SD expressed as a fraction of D.

AXIS_LOG(X0,Y0,X1,Y1,SD,D,P)
Draw a log type axis from (X0,Y0) to (X1,Y1), with distance D between cycles using tick marks which are of height P(mm.). The starting position through the sequence is given by SD expressed as a fraction of D.

CHAR_ABS(CSW,CSH)
Reposition at the character coordinates CSW*Character width, CSH*Character height, relative to the current origin.

CHAR_ANGLE(PHI)
Define the direction in which characters are plotted where the angle PHI is in degrees relative to the x-axis and positive anticlockwise. (Default: 0.).

CHAR_POSN(CSW,CSH)
See CHAR_ABS

CHAR_REL(CSW,CSH)
Reposition at the character coordinates CSW*Character width, CSH*Character height, relative to the current pen position.

CHAR_SIZE(Width,Height)
Define character size (mm.). (Default: 2.4,3.0).

CHAR_SLOPE(PHI)
Causes characters to be slanted at an angle PHI degrees relative to the vertical, with positive to the right. (Default: 0.0).

CURSOR(U,V,Ichar)
Move the cursor under operator control until terminated by a keyboard character or mouse button. The cursor coordinates are returned in U,V and the terminating character or button number in Ichar.

CURVE(F,U_Min,U_Max,Tol)
Draw a smooth curve of the function F between U_Min and U_Max. Tol defines the smoothness (segment length in mm.).

DRAW(U,V)
Reposition at coordinates (U,V) with pen down (see plot). Default coordinates are in mm.

FILL_POLY(Xa,Ya,Na,Xb,Yb,Nb)
Using the currently selected colour, fill the area between the two polygons defined by the Na points in arrays Xa,Ya and the Nb points in the arrays Xb,Yb, with polygon a circumscribing polygon b.

FIT(U,V,N,M,S1,S2)
Fit a smooth curve to the N points given in arrays U,V. If:

(a) M=0 the slopes are not defined at the end points, and will be computed
(b) 1 the initial slope is defined in S1
(c) 2 the final slope is defined in S2
(d) 3 both slopes are defined in S1 and S2.

If (U(N),V(N))=(U(1),V(1)) a closed curve is drawn.

GREY(U,V,W)
Draw to coordinates U,V using intensity or colour W.

GREY_SCALE(W_low,W_high)
Set lower and upper bounds of intensity levels for W.

GREY_SET
Initialise grey levels.

GRID_LAT_LONG(XO,YO,X1,Y1,UO,VO,U1,V1,IC)
Draw a latitude v longitude grid where (XO,YO) (X1,Y1) are the world coordinates of the lower left and upper right corners of the grid respectively (mm.) and (UO,VO) (U1,V1) define limits in local coordinates (degrees). If:

(a) IC<0 only the scale and origin are computed.
(b) =0 as above, but the axes are also drawn
(c) >0 as above with the axes numbered.

GRID_LIN_LIN(XO,YO,X1,Y1,UO,VO,U1,V1,IC)
Draw a linear v linear grid where (XO,YO) (X1,Y1) define the limits in mm., (UO,VO) (U1,V1) define the limits in local units and IC is used as in GRID_LAT_LONG.

GRID_LIN_LOG(XO,YO,X1,Y1,UO,VO,U1,V1,IC)
Draw a log v linear grid where (XO,YO) (X1,Y1) define the limits in mm., (UO,VO) (U1,V1) define the limits in local units and IC is used as in GRID_LIN_LIN

GRID_LOG_LIN(XO,YO,X1,Y1,UO,VO,U1,V1,IC)
Draw a linear v log grid where (XO,YO) (X1,Y1) define the limits in mm., (UO,VO) (U1,V1) define limits in local units and IC is used as in GRID_LIN_LIN

GRID_LOG_LOG(XO,YO,X1,Y1,UO,VO,U1,V1,IC)
Draw a log v log grid where (XO,YO) (X1,Y1) define the limits in mm., (UO,VO) (U1,V1) define limits in local units and IC is used as in GRID_LIN_LIN

LINE_TYPE(I,P)
Define line type I and sequence length P in mm. (Default: 0,0.).

MOVE(U,V)
Reposition at coordinates (U,V) with pen up (see PLOT_ABS).

ORIGIN(X_Shift,Y_Shift)
Redefine the local coordinate origin. (Default: 0.,0.).

PEN_DOWN
Select pen down.

PEN_UP
Select pen up.

PLOT_3D(X,Y,Z,IC)
Plots X,Y,Z in three dimensional coordinates, as if viewed from an azimuth relative to the X-axis and an elevation from the X-Y plane, where IC is used as follows:

(a) IC=0 Initialise using azimuth angle -30.0 and elevation 45.0
(b) =1 X,Y are the azimuth and elevation in degrees
(c) =2 X,Y,Z are translation factors
(d) =3 X,Y,Z are scale factors
(e) =4 Move to X,Y,Z
(f) =5 Draw to X,Y,Z without hidden line
(g) =6 Draw to X,Y,Z with hidden line
(h) =7 Similar to 6 but does not draw (find envelope)
(i) =8 Reset envelope

PLOT_3D_SURFACE_XY(X,Y,Z,N,M)
Draw the surface defined by X,Y,Z(X,Y) where:

X = X(i) (i=1,2...M)
Y = Y(j) (j=1,2...N)
Z = Z(i,j)

Before using this routine a 3D coordinate system must be initialised by use of the routine PLOT_3D.

PLOT_ABS(X,Y,IC)
Reposition at world coordinates (X,Y) expressed in mm., where IC is used as follows:

(a) IC<0 Use pen up
(b) =0 No change in pen condition
(c) >0 Use pen down

PLOT_CHAR_1(M,N)
Plot the character number N, using the soft character set number M.

PLOT_CHAR_2(NDAT)
Plot the character which is defined by data in the INTEGER*4 array NDAT. (See source code).

PLOT_CHAR_symbol
Plot the character defined by symbol as follows:

(a) A square-root sign when symbol=SQROOT
(b) A Greek upper case character when symbol=name_U and name is one of ALPHA, BETA, GAMMA, DELTA, EPSILON, ZETA, ETA, THETA, IOTA, KAPPA, LAMBDA, MU, NU, XI, OMRICON, PI, RHO, SIGMA, TAU, UPSILON, PHI, XI, PSI, OMEGA
(c) A Greek lower case character when symbol=name_L and name is as before

These symbols have been provided in this form for convenience since they commonly occur in notation.

PLOT_CONTOUR(ZO,Z,M,N,IC,SO)
Plot the contours of Z(X,Y)=ZO where:

```
X=i
Y=j
Z=Z(i,j)
```

for 1=1...M, j=1...N. Special effect are obtained by setting:

```
IC=100*K+L
```

where integer L (<100) is the pen number to be used for annotation, and if L is zero no annotation is produced. The integer K defines whether interpolated points on the grid (i,j) are joined by straight lines (K=0) or joined by a smooth curve according (K non-zero). If selected annotation is placed to begin at a distance SO along the contour from its start.

PLOT_DEVICE_(Text)
Parameter Text is of type CHARACTER*(*) and is used to give instructions in the form keyword=value[,...] where [,...] means additional expressions may be given. The form of each expression is as follows:

Keyword	Value	
DEVICE	dd	Where dd is a valid device name in use
STATUS	ON	Enable device output
	OFF	Disable device output
ID-VD	n	Select a virtual display n (1 to 4)
ID-WD	n	Select a window display n (1 to 4)
TITLE	"title"	The window title

If no device is specified then further action applies to all selected devices. An ID-VD number must refer to a virtual display previously created by PLOT_INIT. An ID-WD number may refer to an existing window, in which case it is selected, or to a new window, in which case PLOT_WINDOW must be used to create the required window (possible preceded by PLOT_VIEW). If no virtual display or window is specified then further action applies to the currently active window (see Examples). An empty character string (Text=' ') causes all selected devices to switch status.

PLOT_DEVICE
Equivalent to PLOT_DEVICE_(' '), switch status of currently selected devices.

PLOT_ERASE_(XO,YO,X1,Y1)
Erase the rectangle defined by the lower left corner at XO,YO and the upper right corner at X1,Y1.

PLOT_ERASE
Erase the complete display or viewport

PLOT_FIN_(Text)
Parameter Text is of type CHARACTER*(*) and is used to give instructions in the form keyword=value[,...] where [,...] means additional expressions may be given. The form of each expression is as follows:

Keyword	Value	
DEVICE	dd	Where dd is a valid device name in use
STATUS	DELETE	Delete the file copy

If no device is specified then further action applies to all selected devices. Normally the file copy is saved and other devices are deleted, but the file copy may also be deleted by specifying STATUS=DELETE.

PLOT_FIN
Equivalent to PLOT_FIN_(' '), save the file copy (if selected) and delete other devices.

PLOT_INIT_(Text)
Parameter Text is of type CHARACTER*(*) and is used to give instructions in the form keyword=value[,...] where [,...] means additional expressions may be given. The form of each expression is as follows:

Keyword	Value	
DEVICE	dd	Where dd is a valid device name to be used, namely GF, VG, WG, RG, HP, or TT
WINDOW	FULL	Select and map to the full screen size in mm.
	A4-H	Select and map to A4 landscape
	A4-V	Select and map to A4 portrait
	NONE	No window created
ID-VD	n	Create virtual display number n (n=1,2,3,4)
TITLE	"text"	The window title

Any hardware combinations can specified by repeating the DEVICE=dd expression. The mnemonic TT can be used to represent either VG or WG determined by the login device. If no device is specified then 'DEVICE=TT,DEVICE=GF' is assumed. Use of TT allows an interactive device to be selected without GF. If no window is specified a new window is created and mapped to A4-H. The window option NONE is used to over-ride the default window creation. In this case no window is created at this stage (see PLOT_WINDOW). An empty character string (Text=' ') is equivalent to 'WINDOW=A4-H'. Initialise the hardware and software as follows:

(a) Set coordinate scale factors (Xscale,Yscale)=(1,1)
(b) Set coordinate origin (Xshift,Yshift)=(0,0)
(c) Set character size (Xchsiz,Ychsiz)=(2.4,3.0)
(d) Set character direction (PHI) =(0.)
(e) Set character slope (PHI) =(0.)

PLOT_INIT
Equivalent to PLOT_INIT_(' ')

PLOT_LIMITS(Umin,Vmin,Umax,Vmax)
Define plotting limits in current plotter units, where Umin,Vmin defines the lower left corner of a rectangle and Umax,Vmax the upper right corner.

PLOT_MARK(I)
Plot an identification marker at the current position, where I determines the marker shape, in the range 1 to 9. The size of the marker is determined by the current horizontal character size or as specified by PLOT_MARK_SIZE(Size).

PLOT_MARK_SIZE(Size)
Determines the size in mm of marker produced by PLOT_MARK. Size=0. resets to the current horizontal character size.

PLOT_MODE(I)
Define the writing mode as follows:

(a) I=0 Replace writing

(b) 1 Overlay writing
(c) 2 Complement writing
(d) 3 Erase writing
(e) 4 Negative writing off
(f) 5 Negative writing on

PLOT_NUM(Val,N,M)
Plot Val (NB Val is real) as a character string, using the hard character set, with N figures before the decimal point and M after. If M=0 an integer format is used. Positive numbers are preceded by a space, and negative numbers by a - sign.

PLOT_NUM_SOFT(Val,N,M)
Plot Val as a character string, using the soft character set (see PLOT_NUM).

PLOT_REL(X,Y,IC)
Reposition at relative coordinates (X,Y) expressed in mm. See PLOT_ABS

PLOT_TEXT(Text,N)
Plot the N characters in Text, using the hard character set. Special effects can be obtained as follows, where n is an integer value:

(a) "nS" Causes n spaces to be output (the quotes are part of the syntax)
(b) "nC" Causes n newlines, relative to the start point
(c) "P" Causes the character " to be plotted.

After completion the pen remains at the end of the current line.

PLOT_TEXT_SOFT(Text,N)
Plot the N characters in Text, using the soft character set. Special effects can be obtained as follows, where n is an integer value:

(a) "nS" Causes n spaces to be output (the quotes are part of the syntax)
(b) "nC" Causes n newlines, relative to the start point
(c) "nB" Causes characters to be selected from set n
(d) "P" Causes the character " to be plotted.

After completion the pen remains at the end of the current line.

PLOT_VIEW(Xmin,Ymin,Xmax,Ymax)
Define or modify a viewport for the current window using Xmin,Ymin as the lower left corner of a rectangle and Xmax,Ymax as the upper right.

PLOT_WINDOW(Xmin,Ymin,Xmax,Ymax)
Create or modify a window to the current virtual display using Xmin,Ymin as the lower left corner of a rectangle and Xmax,Ymax as the upper right. (See PLOT_DEVICE).

READ_KB(Buffer,N1,N2)
Read data from the currently selected keyboard into the CHARACTER string Buffer, where N1 is the maximum number of characters to be read (unless input is terminated by <CR>, and N2 is the actual byte count on completion.

READ_KB_NOECHO(Buffer,N1,N2)
Similar to READ_KB but without echo.

READ_KB_CHECK(N)
Check the keyboard input buffer and set N equal to the number of characters contained in it.

SCALE(X_Scale,Y_Scale)
Redefine the coordinate scale factors. (Default: 1.,1.).

SCFAC_LIN(H0,H1,SD,D)
Calculates suitable scale factors for axis drawing, where H0,H1 are the given values of the start and finish points and D is the calculated tick length interval and SD the position of the first tick position (as a fraction of D). D and SD are chosen to have 'nice' values.

SCFAC_LOG(H0,H1,SD,D)
Calculates suitable factors for log-axis drawing, where D is the cycle interval and SD the start point.

SELECT_PEN(I)
Select pen number I. (Default: 1).

SELECT_PEN_COLOUR(Ipen,Red,Green,Blue)
Define the shade/colour of pen number Ipen as specified by the Red, Green, Blue values (each in the range 0. to 1.) with special effects as follows:

Ipen	Red	Green	Blue	
0	0.	0.	0.	Reset all pens to a standard sequence
<0	r	g	b	Set all pens to shades of the colour specified
>=0	r	g	b	Set pen Ipen to the colour specified

6 METHOD OF USE

6.1 The FORTRAN examples provided demonstrate the use of many of the routines described. Each program, for example EXAMPLE_1, should be compiled:

```
FOR Example_1
```

linked with the shareable library (named GRAPH here):

```
LINK Example_1,GRAPH/LIBR
```

and run:

```
RUN Example_1
```

Example_1 uses automatic device selection and therefore a file copy is produced with the file name PLOT.PLT. In addition a display copy is produced if the program is run from a suitable interactive device. The file copy may be displayed on a suitable interactive device by use of the command DISP, or plotted by the command PLOT. Occasionally it is also necessary to link with other libraries (such as MATHS). Several examples are listed in Annex A.

Annex A. Examples

A.1 The following examples are included in order to demonstrate the use of various routines. Calculations associated with developing graphics images are not proposed as realistic or optimum, but provide a simple image which may be displayed or plotted using the routines described.

```
        PROGRAM         EXAMPLE_1

C       Description:
C               Graphics example showing how to draw a simple graph. The default
C               initialization  is used  to  automatically  define an A4 drawing
C               surface mapped to the device in landscape orientation.

```
      PROGRAM         WINDOWS_TEST

C     Description:
C           An example to demonstrate the use of multiple virtual displays
C           and/or  windows  on a  workstation.  Two virtual displays  are
C           created  green and blue  images respectively.  In each virtual
C           display there are three windows each mapped to the screen  and
C           selected by using the keys A,B,1,2,3 to select virtual display
C           1 or 2, or the window viewports 1,2,3.

C     Author:
C           C Richardson, ARE (Portland)

C     History:
C           Issue   1.0     26 January   1988

C     Local Variables:

      REAL            Xs(0:72,0:36),Ys(0:72,0:36)

      CHARACTER*16    Buf

      CHARACTER*12    Title(2,2)/'Green Sphere','Green Cube  ',
     *                           'Blue Sphere ','Blue Cube   '/

C     Main Entry Point:

      IP10=1                                          !Pen number range for virtual
