13. ABSTRACT (Maximum 200 words) All <i>trans</i> -polyacetylene is considered the prototypical broad band gap quasi one-dimensional organic semiconductor. Intrinsic soliton defects have long been known to be crucial to the understanding the observed optical, infrared, and magnetic properties of this system at low doping levels. Magnetic resonance techniques provide powerful experimental probes into the nature and environment of these neutral radical defects. Despite the importance of the measured hyperfine tensors in the further characterization of these defect centers very few theoretical studies have attempted to calculate these interactions directly. In an earlier work we showed that first-principles spin-polarized local density functional methods reliably predict proton Fermi-contact coupling constants for planar, neutral, organic radicals. We have also used these methods to calculate the hyperfine interactions associated with the soliton defect in polyacetylene. Here we compare the results of these soliton studies to very recent experimental results. Our predicted ratio of the negative to positive spin densities is in good agreement with the results of Mehring <i>et al.</i> ¹ obtained from triple resonance studies. The negative spin densities arise from spin-polarization effects which also cause the soliton level at mid-gap to be split by several tenths of an eV. ¹ M. Mehring <i>et al</i> , <i>Synth. Metals</i> 28: D399 (1989). * Supported in part by ONR contract # N0001490WX24264.

Abstract submitted for the Fall 1990 Meeting of the Materials Research Society
Boston, Massachusetts, November 26–December 1, 1990

Symposium K: Defects in Materials

FIRST PRINCIPLES STUDY OF SOLITON HYPERFINE INTERACTIONS
IN POLYACETYLENE* . C. T. White, F. W. Kutzler, J. W. Mint-
mire, and M. Cook, Naval Research Laboratory, Washington, DC
20375.

All *trans*-polyacetylene is considered the prototypical broad band gap quasi one-dimensional organic semiconductor. Intrinsic soliton defects have long been known to be crucial to the understanding the observed optical, infrared, and magnetic properties of this system at low doping levels. Magnetic resonance techniques provide powerful experimental probes into the nature and environment of these neutral-radical defects. Despite the importance of the measured hyperfine tensors in the further characterization of these defect centers very few theoretical studies have attempted to calculate these interactions directly. In an earlier work we showed that first-principles spin-polarized local density functional methods reliably predict proton Fermi-contact coupling constants for planar, neutral, organic π -radicals. We have also used these methods to calculate the hyperfine interactions associated with the soliton defect in polyacetylene. Here we compare the results of these soliton studies to very recent experimental results. Our predicted ratio of the negative to positive spin densities is in good agreement with the results of Mehring *et al.*¹ obtained from triple resonance studies. The negative spin densities arise from spin-polarization effects which also cause the soliton level at mid-gap to be split by several tenths of an eV.

¹ M. Mehring *et al.*, Synth. Metals 28: D399 (1989).

TECHNICAL REPORT DISTRIBUTION LIST

Office of Naval Research (2)
Chemistry Division, Code 1113
800 North Quincy Street
Arlington, VA 22217-5000

Commanding Officer (1)
Naval Weapons Support Center
Dr. Bernard E. Douda
Crane, IN 47522-5050

Dr. Richard W. Drisko (1)
Naval Civil Engineering
Laboratory
Code L52
Port Hueneme, CA 93043

David Taylor Research Center (1)
Dr. Eugene C. Fischer
Annapolis, MD 21402-5067

Dr. Harold H. Singerman (1)
David Taylor Research Center
Code 283
Annapolis, MD 21402-5067

Professor Elliot R. Bernstein (1)
Department of Chemistry
Colorado State University
Fort Collins, CO 80523

Professor Mostafa El-Sayed (1)
Department of Chemistry
University of California, Los Angeles
Los Angeles, CA 90024

Professor Stuart Kauffman (1)
Department of Biochemistry and
Biophysics
University of Pennsylvania
Philadelphia, PA 19104

Professor Jurgen Kreuzer (1)
Department of Physics
Dalhousie University
Halifax, Nova Scotia B3H 3J5
Canada

Dr. W.E. Moerner (1)
IBM Almaden Research Center
650 Harry Road
San Jose, CA 95193

Dr. Robert Green, Director (1)
Chemistry Division, Code 385
Naval Weapons Center
China Lake, CA 93555-6001

Chief of Naval Research (1)
Special Assistant for Marine
Corps Matters
Code 00MC
800 North Quincy Street
Arlington, VA 22217-5000

Dr. Bernadette Eichinger (1)
Naval Ship Systems Engineering
Station
Code 053
Philadelphia Naval Base
Philadelphia, PA 19112

Dr. Sachio Yamamoto (1)
Naval Ocean Systems Center
Code 52
San Diego, CA 92152-5000

Professor Max Berkowitz (1)
Department of Chemistry
University of North Carolina
Chapel Hill, NC 27514

Professor Herschel Rabitz (1)
Department of Chemistry
Princeton University
Princeton, NJ 08544

Professor Geraldine Richmond (1)
Department of Chemistry
University of Oregon
Eugene, OR 97403

Professor Jack Simons (1)
