I. Introduction

A study of the measurement accuracy of selected B-Dot probes has been completed. In general, the interaction of a B-Dot probe with an incident electromagnetic (EM) wave has been studied. Specifically, the scattering of an incident EM plane wave from a single B-Dot probe and the mutual coupling and resulting electromagnetic interference (EMI) between two B-Dot probes in close proximity have been studied, in part.

II. The Infrared Measurement Technique

The investigation of the interaction of B-Dot probes with EM waves was undertaken with a new Infrared (IR) measurement technique [1-8] that was developed at the University of Colorado. With this IR method, the two-dimensional field pattern scattered by the B-Dot probes can be measured in a minimally perturbing way. The interference pattern between two B-Dot probes can also be measured without introducing another metallic probe in the measurement volume.

The IR technique is based on the Joule heating that

occurs in a lossy material as an EM wave passes through the material. The material is assumed to have a finite conductivity, an imaginary permittivity, and an imaginary permeability. The absorbed heat energy is converted into conducted and convected heat energy and into re-radiated electromagnetic energy. This electromagnetic energy is concentrated in the IR band, and can be detected as the energy radiated from a "blackbody" radiator.

The technique involves placing a thin lossy planar detector screen in the vicinity of the probe. The conductivity and the imaginary components of the permittivity and the permeability of the detector material cause the temperature of the detector material to rise above the local ambient temperature of the surrounding environment, by an amount that is proportional to the local electrical and/or magnetic field intensity at each point on the detector screen. This produces a two-dimensional map of the electric and/or magnetic field in the screen material.

The screen material is tailored to be sensitive to only one component of the field. Care is also exercised not to significantly perturb the existing field by the presence of a lossy material. The thickness of the screen material is

usually less than 80 microns; the conductivity of the screen material is usually less than 8 mhos per meter.

The temperature difference between the detector material and the background is detected, digitized, and stored in the memory of an AGA Thermo Vision system on a pixel by pixel basis. This stored data represents the temperature distribution over the extent of the detector screen and is a map of the intensity of the electric and/or magnetic field distribution absorbed in the screen. This data can be analyzed to determine the interaction of the probe with the incident EM field.

III. Test Setup

Two separate measurement configurations were studied. These measurements were made in the Anechoic Chamber in the Electromagnetics Laboratory (EML) at the University of Colorado.

The test setup for the various test configurations is shown in figure 1. The probe was suspended from a wooden support structure using thin non-conducting wire. The axis of the probe was aligned in a horizontal or vertical

FIGURE 1 - TEST SETUP

RADC PROBE STUDY

position. The incident EM plane wave was linearly polarized. For these tests, the incident wave was vertically polarized and the probe axis was also aligned in the vertical direction. The frequency was stepped from 1 to 18 GHz, in 0.5 GHz increments.

A. Ambient Free Space Reference Fields

Before each measurement was made on a B-Dot probe, the ambient background EM field intensity level was measured across the measurement area of interest, using the IR camera. This is a 1 meter by 1 meter planar surface area immediately adjacent to where the probe would be placed. The test setups for this reference level measurement are shown in Appendices A, B and C (cf. figures A1, B1, and C1, for the three different test configurations used).

In one setup, the camera was located 110 inches from the probe, at an angle of 45 degrees from the direction of propagation. In the second setup, the camera was 79.5 inches from the probe, at an angle of 20 degrees from the direction of propagation. In the third setup, the camera was 110 inches from the probe, at an angle of 45 degrees from the direction of propagation.

The measured ambient free space reference data are shown in Appendix A, B, and C. Figures A2 through A6 contain the 4 to 8 GHz data for the single probe reference field; figures B2 through B8 contain the 4 to 14 GHz data for the single probe reference field; and figures C2 through C6 contain the 8 to 14 GHz data for the two probe reference fields.

These fields are the free space fields that the B-Dot probe should measure. The data taken later with the B-Dot probe in place is compared to these background fields to determine the exact effect (perturbation) the probe has on the fields to be measured.

B. B-DOT Interference Fields

A number of measurements of the fields scattered by a single B-Dot probe in free space were made using the IR technique. This same technique was also used to measure the interaction between two B-Dot probes in free space.

Two different test setup configurations were used. In the first configuration, a single B-Dot probe was suspended

in free space and illuminated in the frequency range of 1 to 10 GHz. The scattered fields were determined with the IR technique, as a function of frequency. In the second configuration, two B-Dot probes, at various separations, were also illuminated from 1 to 10 GHz. The coupled fields (including the mutual interaction between the probes) were measured with the IR technique, as a function of separation distance and frequency.

1. Single B-Dot Probe in Free-Space

A number of measurements of the fields scattered by a single B-Dot probe in a free space environment were made using the IR technique. The test setups are shown in figures D1, E1, and F1 in Appendices D, E, and F.

a. Scattered Fields

The measured data are presented in Appendices D, E, and F. Appendix D contains the 1 to 4 GHz data for a single probe; Appendix E contains the 4 to 8 GHz data for a single probe; and Appendix F contains the 8 to 14 GHz data for a single probe.

Each figure in Appendix D, E, or F represents one IR measurement, at a single frequency, at one orientation of the B-Dot probe relative to the incident EM plane wave. The incident wave was vertically polarized in each case. For the measured data presented in this study, the axis of the B-Dot probe was also vertically oriented. The incident EM plane wave was normally incident on the probe.

As shown in figures D2 through D6, E2 through E6, and F2 through F8 in Appendices D, E, and F, the B-Dot probe interacts strongly with the incident EM wave.

Additional tests should be performed with a more sensitive detector screen to determine the exact nature of the coupling mechanisms and the absolute strengths of the interactions.

2. Two B-Dot Probes in Free Space

The interaction (mutual coupling) between two B-dot probes in a free space environment was also investigated. These tests are necessary to determine the mutual interaction between two or more probes placed close to each other. Such a situation would occur if several probes were

being used to simultaneously map a two or three dimensional region of space at the same time.

Two different types of tests were performed. In the first test, the probes were separated at three distinct distances, and the frequency varied from 1 to 8 GHz. In the second test, the probes were tested at three distinct frequencies, and the separation distance varied from 1 to 10 cm.

a. Mutual Coupling & Interference Fields

The measured data presented in Appendices G, H, and I are for 5.75", 4.75" and 2.75" separations between the probes, respectively. For all cases, the test setup is shown in figure G1. The data is for 1 through 8 GHz, in 1 GHz steps.

The measured data presented in Appendices J, K, and L are for 1, 5, and 10 GHz frequencies of the incident excitation, respectively. For each case, the test setup is shown in Figure J1. The data is for 1 through 10 cm separation distances, in 1 cm steps.

Figures J1, K1, and L1 show plan views of the two-probe configurations. Figures J2, K2, and L2 show camera views of the two-probe configurations. As shown in those figures, the horn antenna, which illuminated the two probes at a frequency f , was approximately 2 feet from the probes. The frequency f was varied in the tests. The IR camera was positioned 7 feet from the probes. The camera angle, measured from the direction of the incident wave, was approximately 20 degrees.

B-Dot, series 300 probes were measured. The probes were aligned parallel to each other, and separated a distance D from each other. The distance D was also varied in the tests.

The polarization of the incident wave was vertical; the wave was normally incident on the probes.

Figure L3 shows the interference pattern generated for two B-Dot probes in free space, at 10 GHz, at a spacing of 10 cm, at one orientation, & at one polarization. As shown in that figure, each probe acts basically as a single dipole in free space. In figure L7, the probes are moved closer together (5 cm spacing). As shown in that figure, the probes

are beginning to interact with each other. A standing wave is beginning to form between the handles of the probes. In figure L11, the probes are moved very close to each other (1 cm spacing). Now, the probes interact with each other and the incident wave and significantly perturb the incident field. Strong interference & mutual coupling occurs between the probes at this spacing.

Other frequencies and configurations have been tested. A complete summary of all the test data is presented in the Appendices.

As shown in those figures, the probe interacts with the incident wave & significantly perturbs the incident field. Strong interference & mutual coupling occurs between the probes.

IV. Conclusions

As shown in the Appendices A through L, the B-Dot probe interacts with the incident wave and significantly perturbs the incident field. Additional measurements need to be performed to determine the magnitude of the perturbation and the consequences of the interaction on the measurement

accuracy of the B-Dot probe.

 E-Polarized.

Two B-dot, 300 series probe configuration.
 Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
 Distance between probes (measured at lower end) is 1 cm. Camera angle is
 approximately 20 degrees.
 E-Polarized.

FIGURE 2

Figure L-3

Shot Number : 3018

Time of Recording : 2-13-1989 , 15:43

Frequency : 10×10^9 Hz

Thermal Range : 5

Thermal Level : 52

Ambient Temperature : 27.00°C

Power Level : 494 E -1

IR Camera Lens : Long Wave, f/1.8, 7"

Name of Stored Data File : R2P10GD10.RAW

Comments :

Two B-dot, 300 series probe configuration.

Horn to screen distance is 23 in. and camera to screen distance is 79.5 in. Distance between probes (measured at lower end) is 10 cm. Camera angle is approximately 20 degrees. E-polarized.

Figure L-4

Shot Number : 3017

Time of Recording : 2-13-1989 , 15:38

Frequency : 10 x 10⁹ Hz

Thermal Range : 5

Thermal Level : 53

Ambient Temperature : 27.00°C

Power Level : 49.3 E -1

IR Camera Lens : Long Wave, f/1.8, 7°

Name of Stored Data File : R2P10GD9.RAW

Comments :

Two B-dot, 300 series probe configuration.

Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
Distance between probes (measured at lower end) is 9 cm. Camera angle is
approximately 20 degrees.
E-polarized.

Two B-dot, 300 series probe configuration.
Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
Distance between probes (measured at lower end) is 9 cm. Camera angle is
approximately 20 degrees.
E-polarized.

Figure L-5

Shot Number : 3015

Time of Recording : 2-13-1989 , 15:27

Frequency : 10×10^9 Hz

Thermal Range : 5

Thermal Level : 52

Ambient Temperature : 27.00°C

Power Level : 496 E -1

IR Camera Lens : Long Wave, f/1.8, 7°

Name of Stored Data File : R2P10GD7.RAW

Comments :

Two 8-dot, 300 series probe configuration.
Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
Distance between probes (measured at lower end) is 7 cm. Camera angle is approximately 20 degrees.
E-polarized.

Figure L-6
 Shot Number : 3012
 Time of Recording : 2-13-1989 , 15:22
 Frequency : 10×10^9 Hz
 Thermal Range : 5
 Thermal Level : 52
 Ambient Temperature : 27.00°C
 Power Level : 493 E -1
 IR Camera Lens : Long Wave, f/1.8, 7"
 Name of Stored Data File : R2P10G06.RAW

Comments :

Two B-dot, 300 series probe configuration.
 Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
 Distance between probes (measured at lower end) is 6 cm. Camera angle is
 approximately 20 degrees.
 E-polarized.

Figure L-7
 Shot Number : 3009
 Time of Recording : 2-13-1989 , 15:16
 Frequency : 10×10^9 Hz
 Thermal Range : 5
 Thermal Level : 52
 Ambient Temperature : 27.00°C
 Power Level : 49.8 E -1
 IR Camera Lens : Long Wave, f/1.8, 7°
 Name of Stored Data File : R2P10G05.RAW

Comments :

Two B-dot, 300 series probe configuration.
 Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
 Distance between probes (measured at lower end) is 5 cm. Camera angle is
 approximately 20 degrees.
 E-polarized.

Figure L-8

Shot Number : 3008

Time of Recording : 2-13-1989 , 15:11

Frequency : 10×10^9 Hz

Thermal Range : 5

Thermal Level : 52

Ambient Temperature : 27.00°C

Power Level : 498 E -1

IR Camera Lens : Long Wave, f/1.8, 7°

Name of Stored Data File : r2p10gd4.raw

Comments :

Two 8-dot, 300 series probe configuration.
Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
Distance between probes (measured at lower end) is 4 cm. Camera angle is
approximately 20 degrees.
E-polarized.

Two 8-dot, 300 series probe configuration.
Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
Distance between probes (measured at lower end) is 4 cm. Camera angle is
approximately 20 degrees.
E-polarized.

Figure L-9
 Shot Number : 3004
 Time of Recording : 2-13-1989 , 14:58
 Frequency : 10×10^9 Hz
 Thermal Range : 5
 Thermal Level : 52
 Ambient Temperature : 27.00°C
 Power Level : 494 E -1
 IR Camera Lens : Long Wave, f/1.8, 7°
 Name of Stored Data File : r2p10gd3.raw

Comments :

Two B-dot, 300 series probe configuration.
 Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
 Distance between probes (measured at lower end) is 3 cm. Camera angle is
 approximately 20 degrees.
 E-polarized.

Two B-dot, 300 series probe configuration.
 Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
 Distance between probes (measured at lower end) is 3 cm. Camera angle is
 approximately 20 degrees.
 E-polarized.

T

Figure L-10

Shot Number : 3000

Time of Recording : 2-13-1989 , 13:12

Frequency : 10×10^9 Hz

Thermal Range : 5

Thermal Level : 51

Ambient Temperature : 27.00°C

Power Level : 50 E 0

IR Camera Lens : Long Wave, f/1.3, 7°

Name of Stored Data File : r2p10gd2.raw

Comments :

Two B-dot, 300 series probe configuration.
Horn to screen distance is 23 in. and camera to screen distance is 79.5 in.
Distance between probes (measured at lower end) is 2 cm. Camera angle is approximately 20 degrees.
E-polarized.
