Abstract

This report contains data from the second of two CTD cruises conducted as part of the ONR-funded Gibraltar Experiment. These cruises were designed to examine both the larger-scale structure of water masses in the Gulf of Cadiz and Alboran Sea as well as the smaller-scale, though highly variable, structure within the Strait of Gibraltar (Bray, 1986). A total of 184 stations were taken: 179 rosette casts and five time series (yoyo) stations. The 5 yoyo stations comprise a total of 245 down and up traces acquired during two 12-hour and three 24-hour time series of almost continuous sampling. In this report, composite potential temperature vs salinity diagrams are presented for different sections, and traces of temperature, salinity and σ_θ (potential density) are plotted for each station.

List of Figures

1. Station Locations	2-4
2. PRT laboratory calibration	19-20
3. Pressure sensor hysteresis	21-22
4. Salinity check sample differences	25-26

List of Tables

1. Station locations.....	5-12
2. Lag correction filter weights.....	16-17
3. Interpolated points	27

Introduction and Acknowledgements

This report presents data from a cruise in September-October of 1986 which was part of the Gibraltar Experiment field program. The cruise examined the distribution of water masses in the Gulf of Cadiz, the Alboran Sea, and the Strait of Gibraltar. The primary objective of the cruise was to provide observations of temperature, salinity, and geostrophic current which will be used in conjunction with moored observations to estimate heat and salt transport through the strait. Station locations are shown in Figure 1. The sections in the strait, labeled Trafalgar (K1), Tangier (K2), Cala Gande (K3), Cires (K4), Gibraltar (K5), and Along-Strait (K6) correspond to station locations occupied by T. Kinder (hence the label K) during November of 1985 and June of 1986. Kinder's cruises were also part of the Gibraltar Experiment.

The cruise was carried out aboard the USNS Lynch. The captain and crew of the Lynch, with their skill in maneuvering the ship and assistance in operating the ship's winch, helped to make this project a success. Also gratefully acknowledged are the individual and teamwork contributions of watchstanders: Walt Waldorf, James Wells, Suzanne Shull (SIO watch captains); Myrl Hendershott (SIO), Jerry Wanetick (SIO), Tom Kinder (NORDA), Henri Lacombe (Museum of Natural History, Paris), Jose Ochoa (CISESE), Gregorio Parrilla (Instituto Espanol de Oceanografia, Madrid), Captain Antonio Ruiz Canavate and Lieutenant Perfecto Villanueva of the Spanish Navy, H. Amrani (Moroccan observer), and Francisco Morales (Spanish observer). Special thanks go to Tom Kinder, who acted as Chief Scientist on the cruise. Particular thanks are due Joan Semler and Mike Clark for their help in preparing the final report. The work reported here was carried out under the auspices of ONR contract N00014-85-C-0407.

Data Processing

This discussion is divided into several sections, organized approximately in the order which the data is acquired and processed. Program listings are available upon request. The sections are: acquisition, error identification, processing, and calibration.

Acquisition

Equipment used on both cruises included: two Neil Brown Instrument Systems (NBIS) Mark III CTDs, 5-liter Niskin bottles, General Oceanics pylons and trip boxes for water samples. CTD#3 (serial no. 01-1087) has a pressure range to 1600 m and CTD#1 (serial no. 01-1062) to 6000 m. The CTD data is acquired from the Mark III underwater unit via a single-conductor oceanographic cable using frequency-shift-key (FSK) modulation. The standard NBIS Mark III CTD samples at a rate of 32.5 Hz, with a single analog combination of fast-response-thermometer (FRT) and platinum-resistance-thermometer (PRT) signals for temperature. CTD 1 and 3 sample at 25 Hz because the FRT data stream is separately digitized. The data are acquired using an SIO-designed and fabricated deck unit which converts the audio FSK signal into a digital data stream. The CTD package lowering rate was maintained at approximately 50 m/min, yielding about 4 cm resolution.

The entire data stream is captured to hard disk in real time, framed and stored on floppy disks using an IBM 9000 computer (after this cruise the IBM 9000 was replaced with a PCAT system). Subsampled data are converted to engineering units (pressure, potential temperature, salinity and density) in real time, displayed in graphic form on the computer, and listed to the line printer simultaneously. This allows the operators to identify problems immediately (such as a fouled conductivity sensor) and to select appropriate depths for calibration check samples. In addition to the hard disk file, a backup audio tape of the FSK signal from the instrument itself is made as an archive, to assure that, if necessary, the data can be recovered.

The acquisition software was written by the principal investigator (NAB), originally for the IBM 9000 and more recently for the PCAT. In the PC version, the data are read in through a serial port, using an assembly language subroutine. The main program, written in FORTRAN 77, stores the raw data to hard disk, and subsamples, scales and displays the real time data. In addition to the standard variables (pressure, temperature and conductivity), the CTD measures elapsed time in seconds from power on. Another capability of the acquisition program is monitoring frame synchronization errors in the CTD data stream. These errors are an indication of the quality of the signal (a function of the instrument itself, the many connections, and the integrity of the conducting cable and slip rings).

Error Identification

Processing of the data is done in a separate step, after the cast is completed. Processing utilizes the entire 25 Hz data stream transmitted by the CTD during a cast; no subsampling is done. The processing program first edits the data stream, rejecting points outside of set bounds of 1 to 3000 db for pressure, 0 to 30°C for temperature, and 30 to 70 mmho for conductivity. In addition, the first differences (scan to scan) of the raw data are constrained to fall within 0.5 db, 0.10°C and 0.20 mmho. Rejected points (except those within 10m of the surface) are stored in error files, for later comparisons. Very few points are rejected under usual conditions. Upon processing, the temperature time series is corrected, as discussed below, to compensate for mismatch of sensor response times, and then bin-averaged into 2 db bins about even pressures. The processed files are edited, using an interactive screen graphics program, and isolated bad points are interpolated. In the last step of processing, laboratory and in situ calibrations are used to determine calibration corrections to be applied to the data.

Time lag correction of temperature

Conceptually, the FRT data is used to 'speed up' the response of the slower PRT. The scheme used here incorporates the stable but relatively slow (270 msec) PRT signal which blurs the true temperature signal over several scans of CTD data (one data scan is 40 msec) and the separately digitized FRT signal. The FRT has a response time of about 80 msec so it contains most of the high frequency variance of the true temperature, but is not a stable absolute temperature measurement in that it is a strong function of pressure and temperature. The technique used to combine these two signals is described in Bray (1987). The response time of the combined temperature signal is about 2 data scans (80 msec), roughly twice that of the conductivity cell. The mismatch of response times between temperature and conductivity sensors on the CTD will result in spurious salinity spikes if not corrected. This remaining small mismatch may be corrected either using a scheme like that of Horne and Toole (1980), or by simply shifting the time series of combined temperature by 2 scans relative to the conductivity series. In processing data from the first Gibraltar cruise (Bray, 1980), Horne and Toole's method was used; the filter weights are listed in Table 2a. For this present cruise, the computationally faster shifting of time series was used. The resultant salinity curves are essentially free of spikes, even in regions of high temperature gradient.

Processing the 14 stations acquired with CTD#1 (GB2043 and GB2047 through GB2059) revealed that the FRT on CTD#1 was not responding correctly. As a result, these stations were reprocessed using only the PRT signal. The lag correction technique of Horne and Toole (1980) was applied, to correct sensor mismatch. Weights used in this technique for CTD#1 are given in Table 2b. While this resulted in acceptable salinity traces, there were more spikes than with the combined FRT/PRT technique used on the stations taken with CTD#3.

Table 2a. Lag Correction Filter Weights - CTD#3

Salinity

Salinity is calculated from the raw conductivity and the combined PRT + FRT signal, using the Practical Salinity Scale (subroutine SAL78, Fofonoff and Millard, 1983).

Post-process editing

Occasional gaps and other isolated problems occur in the data, and are not corrected by the processing program. A post-processing editor on the PCAT is used to locate and correct these bad data by linear interpolation. As some judgment is involved in determining whether a given point is, in fact, bad, all interpolated points are listed in Table 3. Uptypes rather than downtraces appear for stations where near-surface values are incorrect in the downtrace or where irreparable errors occurred. In most of these latter cases there is a problem with the conductivity signal, due to fouling of the sensor. Stations where uptypes are used are: 39, 46, 62, 66, 77, 89, 92, 93, 100, 101, 102.

Calibration

Pre- and post-cruise laboratory calibration of pressure and temperature.

The instruments were calibrated in the Scripps ODF laboratory before and after each cruise (the post-GB1 calibration is not the same as the pre-GB2 calibration). Laboratory calibrations include absolute calibration of the CTD PRT over a range of about 30°C, against a National Bureau of Standards (NBS) standardized platinum resistance thermometer, and absolute calibration of CTD pressure against a Russka dead weight tester under conditions of loading vs unloading (hysteresis) at room temperature as well as about 0°C (see Figures 2 and 3).

The temperature and pressure offsets, determined from pre-cruise calibrations, were applied in the initial processing program as follows: +0.005°C to CTDs 1 and 3, -14 db to CTD#1, and -4 db to CTD#3. These offsets were correct for pressure; however, offset values for temperature should have been +0.007°C for CTD#1 and -0.005°C for CTD#3. In

Figure 2a. Pre- and post-cruise PRT calibrations CTD#3.

Figure 2b. Pre- and post-cruise PRT calibrations CTD#1.

Figure 3a. Pre- and post-cruise pressure sensor hysteresis CTD#3.

Figure 3b. Pre- and post-cruise pressure sensor hysteresis CTD#1.

the final step of processing, the calibration values, along with the salinity calibrations, are applied to the initially processed data. The difference between the correct value and the temperature offset applied to the data during initial processing is $+0.002^{\circ}\text{C}$ for CTD#1 and -0.010°C for CTD#3. These differences are noted in the station headers of the final calibrated files.

In situ calibration of salinity

Conductivity sensors are generally less stable over time than PRTs and strain gauge pressure sensors, and are subject to change in calibration due to shock or vibration. It is therefore necessary to calibrate the CTD conductivity cell repeatedly during each cruise. It should be emphasized that in situ samples are useful calibrations only insofar as the water sample measured at the bottle is the same as that measured at the CTD sensor head, about 1.5 m below. The overall accuracy sought is 0.005°C , 0.005 ppt, and 5 db. Thus, great care has been taken to exploit even thin isohaline layers, and to match the water sample with the corresponding CTD data as accurately as possible.

Salinity check samples were taken at each rosette station (i.e., all non-yoyo stations). Water sample salinities were analyzed aboard the ship within a day or so of the time the sample was taken, using a Guildline Autosol salinometer, and IOS wormley standard water batch P-96. The conductivity ratios determined with the salinometer were then converted to practical salinity units using the algorithm of Fofonoff and Millard (1983), the same algorithm used to compute salinities from the CTD data. The salinometer was calibrated against standard water before and after each box of about 20 samples. The in situ calibration results are shown in Figures 4a and 4b. Salinity differences (Salinometer-CTD) are plotted as a function of depth, as a function of station number, and as a function of sequential sample number during the cruise. A total of 370 samples were used from CTD#3 and 46 samples from CTD#1. Note the apparent depth dependence in the samples from CTD#1. This is discussed below. CTD#3 shows no such tendency. The mean difference

for CTD#3 is -0.014 ppt, with standard deviation ± 0.005 ppt. This offset has been applied to the processed data.

The mean salinity difference for CTD#1 is -0.012 ppt with standard deviation ± 0.004 ppt. However, this offset becomes more positive with depth (see Fig. 4b). The slope of the mean line of salinity check samples (6.26×10^{-6}) is applied to compensate for the depth dependence of the offset as follows:

$$S_{\text{cal}} = S_{\text{raw}} - 0.012 + 6.26 \times 10^{-6}p$$

In this equation the calibrated salinity (S_{cal}) is equal to the raw salinity (S_{raw}) plus the negative offset of -0.012 plus the mean slope multiplied by the pressure. The effect is that the calibrated salinity has been corrected appropriately as a function of the pressure.

Figure 4a. CTD #3 Salinity check samples according to depth, station number, and sample number.

Figure 4b. CTD #1 Salinity check samples according to depth, station number, and sample number.

Rosette Station Profiles

The 2 db data series are plotted on the following pages. All points in the series are plotted, but only subsampled "standard" depth data are listed.

Important: Temperature traces (in degrees C) are bold solid lines, salinity traces (in practical salinity units) are light solid lines and σ_t traces are dots (actual data points).

Station header information is also listed on each page. It is mostly self-explanatory, but the following may be of interpretative help. Across the top of each page are: station sequential number, latitude, longitude, date, hour (GMT), cast depth (in db) and water depth in meters, corrected for depth of hull transducer, but not for sound speed variations. Below the plot is ancillary header information: the year day with decimal (GMT) time; sea surface temperature, air temperature and relative humidity; wind speed in kt, and CTD identification number. The next two lines are comments. The first of these is entered at the processing stage. To the right of this comment is the station position relative to Tarifa (36°N, 5.63°W), in km east and km north. The second comment is the original comment entered at the time of acquisition. The first 8 characters of this comment identify the station location of the station.

Yoyo Station Profiles

The 2 db data series are plotted on the following pages. All points in the series are plotted, but only subsampled "standard" depth data are listed

* * * * *

Important: Temperature traces (in degrees C) are bold solid lines, salinity traces (in practical salinity units) are light solid lines and σ_θ traces are dots (actual data points). These plots include both the yoyo down- and uptraces.
