Certificate Information

The following Ada implementation was tested and determined to pass ACVC 1.11. Testing was completed on 19 June 1990.

Compiler Name and Version: MIPS ASAPP 3.0

Host Computer System: MIPS M/2000, RISC/os 4.50

Target Computer System: R3200-6 CPU board, No OS

Customer Agreement Number: 90-03-08-MIP

See Section 3.1 for any additional information about the testing environment.

As a result of this validation effort, Validation Certificate 900619W1.11010 is awarded to MIPS Computer Systems, Inc. This certificate expires on 1 March 1993.

This report has been reviewed and is approved.

Declaration of Conformance

Customer: MIPS Computer Systems, Inc.
Ada Validation Facility: ASD/SCEL, Wright-Patterson AFB OH 45433-6503
Ada Compiler Validation Capability (ACVC) Version: 1.11

Ada Implementation:

Compiler Name and Version : MIPS ASAPP 3.0
Host Computer System: MIPS M/2000; RISC/os 4.50
Target Computer System: R3200-6 CPU board; No OS.

Customer's Declaration

I, the undersigned, representing MIPS Computer Systems, Inc., declare that MIPS Computer Systems has no knowledge of deliberate deviations from the Ada Language Standard ANSI/MIL-STD-1815A in the implementation listed in this declaration. I declare that MIPS Computer Systems, Inc. is the owner of the above implementation and the certificates shall be awarded in the name of the owner's corporate name.

CHAPTER 1

INTRODUCTION

The Ada implementation described above was tested according to the Ada Validation Procedures [Pro90] against the Ada Standard [Ada83] using the current Ada Compiler Validation Capability (ACVC). This Validation Summary Report (VSR) gives an account of the testing of this Ada implementation. For any technical terms used in this report, the reader is referred to [Pro90]. A detailed description of the ACVC may be found in the current ACVC User's Guide [UG89].

1.1 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the Ada Certification Body may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject implementation has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from the AVF which performed this validation or from:

National Technical Information Service
5285 Port Royal Road
Springfield VA 22161

Questions regarding this report or the validation test results should be directed to the AVF which performed this validation or to:

Ada Validation Organization
Institute for Defense Analyses

1.3 ACVC TEST CLASSES

Compliance of Ada implementations is tested by means of the ACVC. The ACVC contains a collection of test programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable. Class B and class L tests are expected to produce errors at compile time and link time, respectively.

The executable tests are written in a self-checking manner and produce a PASSED, FAILED, or NOT APPLICABLE message indicating the result when they are executed. Three Ada library units, the packages REPORT and SPRT13, and the procedure CHECK FILE are used for this purpose. The package REPORT also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The package SPRT13 is used by many tests for Chapter 13 of the Ada Standard. The procedure CHECK FILE is used to check the contents of text files written by some of the Class C tests for Chapter 14 of the Ada Standard. The operation of REPORT and CHECK FILE is checked by a set of executable tests. If these units are not operating correctly, validation testing is discontinued.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that all violations of the Ada Standard are detected. Some of the class B tests contain legal Ada code which must not be flagged illegal by the compiler. This behavior is also verified.

Class L tests check that an Ada implementation correctly detects violation of the Ada Standard involving multiple, separately compiled units. Errors are expected at link time, and execution is attempted.

In some tests of the ACVC, certain macro strings have to be replaced by implementation-specific values -- for example, the largest integer. A list of the values used for this implementation is provided in Appendix A. In addition to these anticipated test modifications, additional changes may be required to remove unforeseen conflicts between the tests and implementation-dependent characteristics. The modifications required for this implementation are described in section 2.3.

For each Ada implementation, a customized test suite is produced by the AVF. This customization consists of making the modifications described in the preceding paragraph, removing withdrawn tests (see section 2.1) and, possibly some inapplicable tests (see Section 2.2 and [UG89]).

In order to pass an ACVC an Ada implementation must process each test of the customized test suite according to the Ada Standard.

1.4 DEFINITION OF TERMS

Ada Compiler	The software and any needed hardware that have to be added to a given host and target computer system to allow transformation of Ada programs into executable form and execution thereof.
Ada Compiler Validation Capability (ACVC)	The means for testing compliance of Ada implementations, consisting of the test suite, the support programs, the ACVC user's guide and the template for the validation summary report.
Ada Implementation	An Ada compiler with its host computer system and its target computer system.
Ada Joint Program Office (AJPO)	The part of the certification body which provides policy and guidance for the Ada certification system.
Ada Validation Facility (AVF)	The part of the certification body which carries out the procedures required to establish the compliance of an Ada implementation.
Ada Validation Organization (AVO)	The part of the certification body that provides technical guidance for operations of the Ada certification system.
Compliance of an Ada Implementation	The ability of the implementation to pass an ACVC version.
Computer System	A functional unit, consisting of one or more computers and associated software, that uses common storage for all or part of a program and also for all or part of the data necessary for the execution of the program; executes user-written or user-designated programs; performs user-designated data manipulation, including arithmetic operations and logic operations; and that can execute programs that modify themselves during execution. A computer system may be a stand-alone unit or may consist of several inter-connected units.

INTRODUCTION

Conformity	Fulfillment by a product, process or service of all requirements specified.
Customer	An individual or corporate entity who enters into an agreement with an AVF which specifies the terms and conditions for AVF services (of any kind) to be performed.
Declaration of Conformance	A formal statement from a customer assuring that conformity is realized or attainable on the Ada implementation for which validation status is realized.
Host Computer System	A computer system where Ada source programs are transformed into executable form.
Inapplicable test	A test that contains one or more test objectives found to be irrelevant for the given Ada implementation.
ISO	International Organization for Standardization.
Operating System	Software that controls the execution of programs and that provides services such as resource allocation, scheduling, input/output control, and data management. Usually, operating systems are predominantly software, but partial or complete hardware implementations are possible.
Target Computer System	A computer system where the executable form of Ada programs are executed.
Validated Ada Compiler	The compiler of a validated Ada implementation.
Validated Ada Implementation	An Ada implementation that has been validated successfully either by AVF testing or by registration [Pro90].
Validation	The process of checking the conformity of an Ada compiler to the Ada programming language and of issuing a certificate for this implementation.
Withdrawn test	A test found to be incorrect and not used in conformity testing. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains erroneous or illegal use of the Ada programming language.

CHAPTER 2
IMPLEMENTATION DEPENDENCIES

2.1 WITHDRAWN TESTS

The following tests have been withdrawn by the AVO. The rationale for withdrawing each test is available from either the AVO or the AVF. The publication date for this list of withdrawn tests is 18 May 1990.

E28005C	B28006C	C34006D	B41308B	C43004A	C45114A
C45346A	C45612B	C45651A	C46022A	B49008A	A74006A

CE3411B	CE3412B	CE3812A	CE3814A	CE3902B	

2.2 INAPPLICABLE TESTS

A test is inapplicable if it contains test objectives which are irrelevant for a given Ada implementation. Reasons for a test's inapplicability may be supported by documents issued by the ISO and the AJPO known as Ada Commentaries and commonly referenced in the format AI-ddddd. For this implementation, the following tests were determined to be inapplicable for the reasons indicated; references to Ada Commentaries are included as appropriate.

IMPLEMENTATION DEPENDENCIES

The following 201 tests have floating-point type declarations requiring more digits than `SYSTEM.MAX_DIGITS`:

C24113L..Y (14 tests)	C35705L..Y (14 tests)
C35706L..Y (14 tests)	C35707L..Y (14 tests)
C35708L..Y (14 tests)	C35802L..Z (15 tests)
C45241L..Y (14 tests)	C45321L..Y (14 tests)
C45421L..Y (14 tests)	C45521L..Z (15 tests)
C45524L..Z (15 tests)	C45621L..Z (15 tests)
C45641L..Y (14 tests)	C46012L..Z (15 tests)

The following 21 tests check for the predefined type `LONG_INTEGER`:

C35404C	C45231C	C45304C	C45411C	C45412C
C45502C	C45503C	C45504C	C45504F	C45611C
C45612C	C45613C	C45614C	C45631C	C45632C
B52004D	C55B07A	B55B09C	B86001W	C86006C
CD7101F				

C35702A, C35713B, C45423B, B86001T, and C86006H check for the predefined type `SHORT_FLOAT`.

C35713D and B86001Z check for a predefined floating-point type with a name other than `FLOAT`, `LONG_FLCAT`, or `SHORT_FLOAT`.

C45531M..P (4 tests) and C45532M..P (4 tests) check fixed-point operations for types that require a `SYSTEM.MAX_MANTISSA` of 47 or greater.

C45624A..B (2 tests) check that the proper exception is raised if `MACHINE_OVERFLOW` is `FALSE` for floating point types; for this implementation, `MACHINE_OVERFLOW` is `TRUE`.

C86001F recompiles package `SYSTEM`, making package `TEXT_IO`, and hence package `REPORT`, obsolete. For this implementation, the package `TEXT_IO` is dependent upon package `SYSTEM`.

B86001Y checks for a predefined fixed-point type other than `DURATION`.

C96005B checks for values of type `DURATION'BASE` that are outside the range of `DURATION`. There are no such values for this implementation.

D1009C uses a representation clause specifying a non-default size for a floating-point type.

CD2A84A, CD2A84E, CD2A84I..J (2 tests), and CD2A84O use representation clauses specifying non-default sizes for access types.

The following 269 tests check for sequential, text, and direct access files:

CE2102A..C (3)	CE2102G..H (2)	CE2102K	CE2102N..Y (12)
CE2103C..D (2)	CE2104A..D (4)	CE2105A..B (2)	CE2106A..B (2)

IMPLEMENTATION DEPENDENCIES

CE2107A..H (8)	CE2107L	CE2108A..H (8)	CE2109A..C (3)
CE2110A..D (4)	CE2111A..I (9)	CE2115A..B (2)	CE2117A..B (2)
CE2120A..B (2)	CE2201A..C (3)	EE2201D..E (2)	CE2201F..N (9)
CE2203A	CE2204A..D (4)	CE2205A	CE2206A
CE2208B	CE2401A..C (3)	EE2401D	CE2401E..F (2)
EE2401G	CE2401H..L (5)	CE2403A	CE2404A..B (2)
CE2405B	CE2406A	CE2407A..B (2)	CE2408A..B (2)

CE3102F..H (3)	CE3102J..K (2)	CE3103A	CE3104A..C (3)
CE3106A..B (2)	CE3107B	CE3108A..B (2)	CE3109A
CE3110A	CE3111A..B (2)	CE3111D..E (2)	CE3112A..D (4)
CE3114A..B (2)	CE3115A	CE3116A	CE3119A
EE3203A	EE3204A	CE3207A	CE3208A
CE3301A	EE3301B	CE3302A	CE3304A
CE3305A	CE3401A	CE3402A	EE3402B
CE3402C..D (2)	CE3403A..C (3)	CE3403E..F (2)	CE3404B..D (3)
CE3405A	EE3405B	CE3405C..D (2)	CE3406A..D (4)
CE3407A..C (3)	CE3408A..C (3)	CE3409A	CE3409C..E (3)
EE3409F	CE3410A	CE3410C..E (3)	EE3410F
CE3411A	CE3411C	CE3412A	EE3412C
CE3413A..C (3)	CE3414A	CE3602A..D (4)	CE3603A
CE3604A..B (2)	CE3605A..E (5)	CE3606A..B (2)	CE3607B..C (2)
CE3704A..F (6)	CE3704M..O (3)	CE3705A..E (5)	CE3706D
CE3706F..G (2)	CE3804A..P (16)	CE3805A..B (2)	CE3806A..B (2)
CE3806D..E (2)	CE3806G..H (2)	CE3904A..B (2)	CE3905A..C (3)
CE3905L	CE3906A..C (3)	CE3906E..F (2)	

CE2103A, CE2103B, and CE3107A raise the exception `USE_ERROR` because this implementation does not support external file `CREATE` and `OPEN` operations. (See Section 2.3)

2.3 TEST MODIFICATIONS

Modifications (see section 1.3) were required for 16 tests.

The following tests were split into two or more tests because this implementation did not report the violations of the Ada Standard in the way expected by the original tests.

B24009A	B33301B	B38003A	B38003B	B38009A	B38009B
B85008G	B85008H	BC1303F	BC3005B	BD2B03A	BD2D03A
BD4003A					

CE2103A..B (2 tests) and CE3107A raise the unhandled exception `USE_ERROR` and fail to run properly. The AVO has determined that these tests are to be graded as `NOT APPLICABLE` using modified evaluation because these tests do not allow the implementation to raise `USE_ERROR` for external file `CREATE` and `OPEN` operations when these operations are not supported by the implementation.

CHAPTER 3
PROCESSING INFORMATION

3.1 TESTING ENVIRONMENT

The Ada implementation tested in this validation effort is described adequately by the information given in the initial pages of this report.

For a point of contact for technical information about this Ada implementation system, see:

Ankur Saha
MIPS Computer Systems, Inc.
950 DeGuigne Drive
Sunnyvale CA 94086

For a point of contact for sales information about this Ada implementation system, see:

Jean Wood
MIPS Computer Systems, Inc.
950 DeGuigne Drive
Sunnyvale CA 94086

Testing of this Ada implementation was conducted at the customer's site by a validation team from the AVF.

3.2 SUMMARY OF TEST RESULTS

An Ada Implementation passes a given ACVC version if it processes each test of the customized test suite in accordance with the Ada Programming Language Standard, whether the test is applicable or inapplicable; otherwise, the Ada Implementation fails the ACVC [Pro90].

For all processed tests (inapplicable and applicable), a result was obtained that conforms to the Ada Programming Language Standard.

PROCESSING INFORMATION

a) Total Number of Applicable Tests	3579	
b) Total Number of Withdrawn Tests	71	
c) Processed Inapplicable Tests	50	
d) Non-Processed I/O Tests	269	
e) Non-Processed Floating-Point Precision Tests	201	
f) Total Number of Inapplicable Tests	520	(c+d+e)
g) Total Number of Tests for ACVC 1.11	4170	(a+b+f)

The above number of I/O tests were not processed because this implementation does not support a file system. The above number of floating-point tests were not processed because they used floating-point precision exceeding that supported by the implementation. When this compiler was tested, the tests listed in section 2.1 had been withdrawn because of test errors.

3.3 TEST EXECUTION

Version 1.11 of the ACVC comprises 4170 tests. When this compiler was tested, the tests listed in section 2.1 had been withdrawn because of test errors. The AVF determined that 520 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing except for 201 executable tests that use floating-point precision exceeding that supported by the implementation and 269 executable tests that use file operations not supported by the implementation. In addition, the modified tests mentioned in section 2.3 were also processed.

A magnetic tape containing the customized test suite (see section 1.3) was taken on-site by the validation team for processing. The contents of the magnetic tape were loaded onto a system equipped with a 9-track tape driver, and the tests were then copied via NFS to the host machine.

After the test files were loaded onto the host computer, the full set of tests was processed by the Ada implementation.

The tests were compiled and linked on the host computer system, as appropriate. The executable images were transferred to the target computer system by the communications link described above, and run. The results were captured on the host computer system.

PROCESSING INFORMATION

Testing was performed using command scripts provided by the customer and reviewed by the validation team. See Appendix B for a complete listing of the processing options for this implementation. It also indicates the default options. The options invoked explicitly for validation testing during this test were:

Option	Effect
-02	Invoke full optimization for Ada.
-Olimit num	Specify the maximum size, in basic blocks, of a routine that will be optimized by the global optimizer. If a routine has more than this number of basic blocks, it will not be optimized, and a message will be printed. An option specifying that the global optimizer is to be run (-0, -02, or -03) must also be specified. num is assumed to be a decimal number. The default value for num is 500 basic blocks. For ACVC 1.11 validation, -Olimit 1500 is applied to ensure that all tests are optimized.

Test output, compiler and linker listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

APPENDIX A
MACRO PARAMETERS

This appendix contains the macro parameters used for customizing the ACVC. The meaning and purpose of these parameters are explained in [UG89]. The following macro parameters are defined in terms of the value V of \$MAX_IN_LEN which is the maximum input line length permitted for the tested implementation. For these parameters, Ada string expressions are given rather than the macro values themselves.

Macro Parameter	Macro Value
\$BIG_ID1	(1..V-1 => 'A', V => '1')
\$BIG_ID2	(1..V-1 => 'A', V => '2')
\$BIG_ID3	(1..V/2 => 'A') & '3' & (1..V-1-V/2 => 'A')
\$BIG_ID4	(1..V/2 => 'A') & '4' & (1..V-1-V/2 => 'A')
\$BIG_INT_LIT	(1..V-3 => '0') & "298"
\$BIG_REAL_LIT	(1..V-5 => '0') & "690.0"
\$BIG_STRING1	''' & (1..V/2 => 'A') & '''
\$BIG_STRING2	''' & (1..V-1-V/2 => 'A') & '1' & '''
\$BLANKS	(1..V-20 => ' ')
\$MAX_LEN_INT_BASED_LITERAL	"2:" & (1..V-5 => '0') & "11:"
\$MAX_LEN_REAL_BASED_LITERAL	"16:" & (1..V-7 => '0') & "F.E:"
\$MAX_STRING_LITERAL	''' & (1..V-2 => 'A') & '''

MACRO PARAMETERS

The following table contains the values for the remaining macro parameters.

Macro Parameter	Macro Value
\$MAX_IN_LEN	499
\$ACC_SIZE	32
\$ALIGNMENT	4
\$COUNT_LAST	2_147_483_647
\$DEFAULT_MEM_SIZE	16_777_216
\$DEFAULT_STOR_UNIT	8
\$DEFAULT_SYS_NAME	MIPS_CROSS_R3000
\$DELTA_DOC	0.0000000004656612873077392578125
\$ENTRY_ADDRESS	SYSTEM."+"(16)
\$ENTRY_ADDRESS1	SYSTEM."+"(17)
\$ENTRY_ADDRESS2	SYSTEM."+"(2)
\$FIELD_LAST	2_147_483_647
\$FILE_TERMINATOR	' '
\$FIXED_NAME	NO_SUCH_FIXED_TYPE
\$FLOAT_NAME	NO_SUCH_TYPE
\$FORM_STRING	""
\$FORM_STRING2	"CANNOT_RESTRICT_FILE_CAPACITY"
\$GREATER_THAN_DURATION	100_000.0
\$GREATER_THAN_DURATION_BASE_LAST	10_000_000.0

APPENDIX B

COMPILATION SYSTEM OPTIONS

The compiler and linker options of this Ada implementation, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this appendix are to compiler documentation and not to this report.

ada .

Ada compiler

Syntax

ada [options] [source_file]... [linker_options] [object_file.o]...

Options

-# identifier type value (define) Define an identifier of a specified type and value. See Chapter 10, VADS ADA PREPROCESSOR REFERENCE.

-a file_name (archive) Treat file_name as an object archive file created by ar. Since some archive files end with .a, -a is used to distinguish archive files from Ada source files.

-d (dependencies) Analyze for dependencies only. Do not do semantic analysis or code generation. Update the library, marking any defined units as uncompiled. The -d option is used by a.make to establish dependencies among new files.

-e (error) Process compilation error messages using a.error and send it to standard output. Only the source lines containing errors are listed. Only one -e or -E option should be used.

-E
-E file

COMPILATION SYSTEM OPTIONS

-E directory (error output) Without a file or directory argument, ada processes error messages using a.error and directs a brief output to standard output; the raw error messages are left in ada_source.err. If a file pathname is given, the raw error messages are placed in that file. If a directory argument is supplied, the raw error output is placed in dir/source.err. The file of raw error messages can be used as input to a.error. Only one -e or -E option should be used.

-el (error listing) Intersperse error messages among source lines and direct to standard output.

-El

-El file

-El directory (error listing) Same as the -E option, except that source listing with errors is produced.

-ev (error vi(1)) Process syntax error messages using a.error, embed them in the source file, and call the environment editor ERROR_EDITOR. (If ERROR_EDITOR is defined, the environment variable ERROR_PATTERN should also be defined. ERROR_PATTERN is an editor search command that locates the first occurrence of '###' in the error file.) If no editor is specified, vi(1) is invoked.

-G Num Specify the maximum size, in bytes, of a data item that is to be accessed from the global pointer. Num is assigned to be a decimal number. If Num is zero, no data is accessed from the global pointer. The default value for Num is 8 bytes.

-g Have the compiler produce additional symbol table information for full symbolic debugging and not do optimizations that limit full symbolic debugging. The default is to allow optimizations that may make the debugger inaccurate.

-inline Use auto-inlining.

-K (keep) Keep the intermediate language (IL) file produced by the compiler front end. The IL file will be placed in the .objects directory, with the file name Ada_source.i

-L library_name (library) Operate in VADS library library_name (the current working directory is the default).

-lfile_abbreviation (library search) This is an option passed to the UNIX linker, ld(1) telling it to search the specified library file. (No space between the -l and the file abbreviation.)

For a description of the file abbreviations, see also Operating System documentation, ld(1).

COMPILATION SYSTEM OPTIONS

-M *unit_name* (main) Produce an executable program by linking the named unit as the main program. *unit_name* must already be compiled. It must be either a parameterless procedure or a parameterless function returning an integer. The executable program will be named *a.out* unless overridden with the **-o** option.

-M *source_file* (main) Produce an executable program by compiling and linking *source_file*. The main unit of the program is assumed to be the root name of the *.a* file (for *foo.a* the unit is *foo*). Only one *.a* file may be preceded by **-M**. The executable program will be named *a.out* unless overridden with the **-o** option.

-o *executable_file* (output) This option is to be used in conjunction with the **-M** option. *executable_file* is the name of the executable rather than the default *a.out*.

-O[0-2] (optimize) Invoke the code optimization. An optional digit (there is no space before the digit) provides the level of optimization. The default is **-O2**.

-O full optimization
-O0 prevents optimization
-O1 low level optimization
-O2 full optimization

For more information about optimization, see COMPILING ADA PROGRAMS, Compiler Optimizations. See also pragma OPTIMIZE_CODE(OFF)

-P Invoke the Ada Preprocessor. See Chapter VADS ADA PREPROCESSOR REFERENCE.

-p (profile) Pass profiling flag to *a.ld*.
Note: profiling does not work on programs that use tasks.

-R *VADS_library* (recompile instantiation) Force analysis of all generic instantiations, causing reinstantiation of any that are out of date.

-S (suppress) Apply pragma SUPPRESS to the entire compilation for all suppressible checks. See also pragma SUPPRESS(ALL_CHECKS).

-sh (show) Display the name of the tool executable but do not execute it.

-T (timing) Print timing information for the compilation.

-v (verbose) Print compiler version number, date and time of compilation, name of file compiled, command input line, total compilation time, and error summary line. Storage usage information about the object file is provided. With

COMPILATION SYSTEM OPTIONS

OPTIM3, the output format of compression (the size of optimized instructions) is as a percentage of input (unoptimized instructions).

`-Wc, arg1.[arg2...]` Pass the argument[s] `agri` to a compiler pass, where `c` is one of the characters in the next table that designates the pass.

Pass	Character
----	-----
optim3	v
include	h
backend driver	D
ucgen	G
ujoin	j
uld	u
usplit	s
umesrge	m
uopt	o
ugen	c
asl	b

`-w` (warnings) Suppress warning diagnostics.

Description

The command `ada` executes the Ada compiler and compiles the named Ada source file, ending with the `.a` suffix. The file must reside in a VADS library directory. The `ada.lib` file in this directory is modified after each Ada unit is compiled.

By default, `ada` produces only object and net files. If the `-M` option is used, the compiler automatically invokes `a.ld` and builds a complete program with the named library unit as the main program.

Non-Ada object files (`.o` files produced by a compiler for another language) may be given as arguments to `ada`. These files will be passed on to the linker and will be linked with the specified Ada object files.

Command line options may be specified in any order, but the order of compilation and the order of the files to be passed to the linker can be significant.

Several VADS compilers may be simultaneously available on a single system. Because the `ada` command in any VADS location/bin on a system will execute the correct compiler components based upon visible library directives, the option `-sh` is provided to print the name of the components actually executed.

Program listings with a disassembly of machine code

COMPILATION SYSTEM OPTIONS

instructions are generated by a.db or a.das.

See also a.das; a.db; a.error; a.ld; a.mklib, and Operating System reference documentation for the ld(1) utility.

Diagnostics

The diagnostics produced by the VADS compiler are intended to be self-explanatory. Most refer to the RM. Each RM reference includes a section number and, optionally, a paragraph number enclosed in parentheses.

APPENDIX C

APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in Chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of this Ada implementation, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this Appendix are to compiler documentation and not to this report. Implementation-specific portions of the package STANDARD, which are not a part of Appendix F, are:

```
package STANDARD is
  .....

  type INTEGER is range -2147483648 .. 2147483647;
  type SHORT_INTEGER is range -32768 .. 32767;
  type TINY_INTEGER is range -128 .. 127;

  type FLOAT is digits 6 range -3.40282E+38 .. 3.40282E+38;
  type LONG_FLOAT is digits 15
    range -1.79769313486232E+308 .. 1.79769313486232E+308;

  type DURATION is delta 0.001 range -2147483.648 .. 2147483.647;
  .....

end STANDARD;
```

ATTACHMENT I

APPENDIX F. Implementation-Dependent Characteristics

1. Implementation-Dependent Pragmas

1.1. `INLINE_ONLY` Pragma

The `INLINE_ONLY` pragma, when used in the same way as pragma `INLINE`, indicates to the compiler that the subprogram must always be inlined. This pragma also suppresses the generation of a callable version of the routine which saves code space.

1.2. `BUILT_IN` Pragma

The `BUILT_IN` pragma is used in the implementation of some predefined Ada packages, but provides no user access. It is used only to implement code bodies for which no actual Ada body can be provided.

1.3. `SHARE_CODE` Pragma

The `SHARE_CODE` pragma takes the name of a generic instantiation or a generic unit as the first argument and one of the identifiers `TRUE` or `FALSE` as the second argument. This pragma is only allowed immediately at the place of a declarative item in a declarative part or package specification, or after a library unit in a compilation, but before any subsequent compilation unit.

When the first argument is a generic unit, the pragma applies to all instantiations of that generic. When the first argument is the name of a generic instantiation, the pragma applies only to the specified instantiation, or overloaded instantiations.

If the second argument is `TRUE`, the compiler will try to share code generated for a generic instantiation with code generated for other instantiations of the same generic. When the second argument is `FALSE`, each instantiation will

get a unique copy of the generated code. The extent to which code is shared between instantiations depends on this pragma and the kind of generic formal parameters declared for the generic unit.

The name pragma `SHARE BODY` is also recognized by the implementation and has the same effect as `SHARE CODE`. It is included for compatibility with earlier versions of MIPS VADS.

1.4. `NO_IMAGE` Pragma

The pragma suppresses the generation of the image array used for the `IMAGE` attribute of enumeration types. This eliminates the overhead required to store the array in the executable image. An attempt to use the `IMAGE` attribute on a type whose image array has been suppressed will result in a compilation warning and `Program_error` raised at runtime.

1.5. `EXTERNAL_NAME` Pragma

The `EXTERNAL NAME` pragma takes the name of a subprogram or variable defined in Ada and allows the user to specify a different external name that may be used to reference the entity from other languages. The pragma is allowed at the place of a declarative item in a package specification and must apply to an object declared earlier in the same package specification.

1.6. `INTERFACE_OBJECT` Pragma

The `INTERFACE OBJECT` pragma takes the name of a variable defined in another language and allows it to be referenced directly in Ada. The pragma will replace all occurrences of the variable name with an external reference to the second, `link_argument`. The pragma is allowed at the place of a declarative item in a package specification and must apply to an object declared earlier in the same package specification. The object must be declared as a scalar or an access type. The object cannot be any of the following:

- a loop variable,
- a constant,
- an initialized variable,
- an array, or
- a record.

1.7. `IMPLICIT_CODE` Pragma

Takes one of the identifiers `ON` or `OFF` as the single argument. This pragma is only allowed within a machine code procedure. It specifies that implicit code generated by the

APPENDIX F OF THE Ada STANDARD

compiler be allowed or disallowed. A warning is issued if OFF is used and any implicit code needs to be generated. The default is ON.

2. Implementation of Predefined Pragmas

2.1. CONTROLLED

This pragma is recognized by the implementation but has no effect.

2.2. ELABORATE

This pragma is implemented as described in Appendix B of the Ada RM.

2.3. INLINE

This pragma is implemented as described in Appendix B of the Ada RM.

2.4. INTERFACE

This pragma supports calls to 'C' and FORTRAN functions. The Ada subprograms can be either functions or procedures. The types of parameters and the result type for functions must be scalar, access, or the predefined type ADDRESS in SYSTEM. All parameters must have mode IN. Record and array objects can be passed by reference using the ADDRESS attribute.

2.5. LIST

This pragma is implemented as described in Appendix B of the Ada RM.

2.6. MEMORY_SIZE

This pragma is recognized by the implementation. The implementation does not allow SYSTEM to be modified by means of pragmas; the SYSTEM package must be recompiled.

2.7. NOT_ELABORATED

This pragma can only appear in a library package specification. It indicates that the package will not be elaborated because it is either part of the RTS, a configuration package, or an Ada package that is referenced from a language other than Ada. The presence of this pragma suppresses the generation of elaboration code and issues warnings if elaboration code is required.

2.8. OPTIMIZE

This pragma is recognized by the implementation but has no effect.

2.9. PACK

This pragma will cause the compiler to choose a non-aligned representation for composite types. It will not cause objects to be packed at the bit level.

2.10. PAGE

This pragma is implemented as described in Appendix B of the Ada RM.

2.11. PRIORITY

This pragma is implemented as described in Appendix B of the Ada RM.

2.12. SHARED

This pragma is recognized by the implementation but has no effect.

2.13. STORAGE_UNIT

This pragma is recognized by the implementation. The implementation does not allow SYSTEM to be modified by means of pragmas; the SYSTEM package must be recompiled.

2.14. SUPPRESS

This pragma is implemented as described, except that RANGE_CHECK and DIVISION_CHECK cannot be suppressed.

2.15. SYSTEM_NAME

This pragma is recognized by the implementation. The implementation does not allow SYSTEM to be modified by means of pragmas, the SYSTEM package must be recompiled.

3. Implementation-Dependent Attributes

3.1. P'REF

This attribute can be used to convert an integer to an address.

4. Specification of Package SYSTEM

APPENDIX F OF THE Ada STANDARD

with UNSIGNED TYPES;
package SYSTEM is

pragma suppress(ALL_CHECKS);
pragma suppress(EXCEPTION_TABLES);
pragma not_elaborated;

type NAME is (MIPS_CROSS_R3000);

SYSTEM_NAME : constant NAME := MIPS_CROSS_R3000;

STORAGE_UNIT : constant := 8;

(I: UNSIGNED_TYPES.UNSIGNED_INTEGER) return ADDRESS renames "+";

NO_ADDR : constant ADDRESS;

type TASK_ID is private;
NO_TASK_ID : constant TASK_ID;

type PROGRAM_ID is private;
NO_PROGRAM_ID : constant PROGRAM_ID;

private

```

type ADDRESS is new UNSIGNED_TYPES.UNSIGNED_INTEGER;

NO_ADDR : constant ADDRESS := 0;

pragma BUILT_IN(">");
pragma BUILT_IN("<");
pragma BUILT_IN(">=");
pragma BUILT_IN("<=");
pragma BUILT_IN("-");
pragma BUILT_IN("+");

type TASK_ID is new UNSIGNED_TYPES.UNSIGNED_INTEGER;
NO_TASK_ID : constant TASK_ID := 0;

type PROGRAM_ID is new UNSIGNED_TYPES.UNSIGNED_INTEGER;
NO_PROGRAM_ID : constant PROGRAM_ID := 0;

```

end SYSTEM;

5. Restrictions on Representation Clauses

5.1. Pragma PACK

In the absence of pragma PACK, record components are padded so as to provide for efficient access by the target hardware; pragma PACK applied to a record eliminates the padding where possible. Pragma PACK has no other effect on the storage allocated for record components for which a record representation is required.

5.2. Record Representation Clauses

For scalar types, a representation clause will pack to the number of bits required to represent the range of the subtype. A record representation applied to a composite type will not cause the object to be packed to fit in the space required. An explicit representation clause must be given for the component type. An error will be issued if there is insufficient space allocated.

5.3. Address Clauses

Address clauses are supported for variables and constants that have no initial values in their declaration.

5.4. Interrupts

APPENDIX F OF THE Ada STANDARD

Interrupt entries are supported through signals.

5.5. Representation Attributes

The ADDRESS attribute is supported for the following entities, but a meaningless value is returned.

- Packages
- Tasks
- Labels
- Entries

6. Conventions for Implementation-generated Names

There are no implementation-generated names.

7. Interpretation of Expressions in Address Clauses

Address clauses are supported for constants and variables.

8. Restrictions on Unchecked Conversions

None.

9. Restrictions on Unchecked Deallocations

None.

10. Implementation Characteristics of I/O Packages

Instantiations of DIRECT_IO use the value MAX_REC_SIZE as the record size (expressed in STORAGE_UNITS) when the size of ELEMENT_TYPE exceeds that value. For example, for unconstrained arrays such as string, where ELEMENT_TYPE'SIZE is very large, MAX_REC_SIZE is used instead. MAX_RECORD_SIZE is defined in SYSTEM and can be changed by a program before instantiating DIRECT_IO to provide an upper limit on the record size. In any case, the maximum size supported is 1024 x 1024 x STORAGE_UNIT bits. DIRECT_IO will raise USE_ERROR if MAX_REC_SIZE exceeds this absolute limit.

Instantiations of SEQUENTIAL_IO use the value MAX_REC_SIZE as the record size (expressed in STORAGE_UNITS) when the size of ELEMENT_TYPE exceeds that value. For example, for unconstrained arrays such as string, where ELEMENT_TYPE'SIZE is very large, MAX_REC_SIZE is used instead. MAX_RECORD_SIZE is defined in SYSTEM and can be changed by a program before instantiating SEQUENTIAL_IO to provide an upper limit on the record size. SEQUENTIAL_IO imposes no limit on MAX_REC_SIZE.

11. Implementation Limits

The following limits are actually enforced by the implementation. It is not intended to imply that resources up to or even near these limits are available to every program.

11.1. Line Length

The implementation supports a maximum line length of 500 characters including the end of line character.

11.2. Record and Array Sizes

The maximum size of a statically sized array type is 24,000,000 x STORAGE_UNITS. The maximum size of a statically sized record type is 24,000,000 x STORAGE_UNITS. A record type or array type declaration that exceeds these limits will generate a warning message.

11.3. Default Stack Size for Tasks

In the absence of an explicit STORAGE_SIZE length specification, every task except the main program is allocated a fixed size stack of 10,240 STORAGE_UNITS. This is the value returned by T'SORAGE_SIZE for a task type T.

11.4. Default Collection Size

In the absence of an explicit STORAGE_SIZE length attribute, the default collection size for an access type is 100 times the size of the designated type. This is the value returned by T'SORAGE_SIZE for an access type T.

11.5. Limit on Declared Objects

There is an absolute limit of 6,000,000 x STORAGE_UNITS for objects declared statically within a compilation unit. If this value is exceeded, the compiler will terminate the compilation of the unit with a FATAL error message.
