These working papers were prepared for the timely dissemination of information; this document does not represent the official position of NOARL.

ABSTRACT

The Navy K_a-band Radiometric Mapping System (KRMS) was used to acquire high-resolution passive microwave imagery of sea ice in the Bering, Chukchi, and Beaufort Seas during the joint Navy-NASA SSM/I validation experiment in March 1988. Additionally, imagery of rivers and lakes was acquired in the vicinity of Fairbanks, Alaska, on two different days during this period. Information presented here constitutes an index to digital tapes of KRMS imagery acquired during these flights.

ACKNOWLEDGMENTS

Data indexed here were acquired with funds provided both by the Oceanographer of the Navy (OP-096, project element 63704N) through the Satellite Applications Technology (SAT) Program, A.E. Pressman, Program Manager, and by NASA through the Polar Programs Office, R. Thomas, Project Manager. We thank Bruce Heydlauff of the Naval Weapons Center, China Lake, California, who provided assistance in analog to digital conversion of KRMS data.

Navy-NASA SSM/I Validation Experiment
KRMS Data Products

INTRODUCTION

In March 1988 single-band (33.6-GHz, vertical polarization) passive microwave imagery was acquired with the Navy K_a-band Radiometric Mapping System (KRMS) in support of the Navy–NASA SSM/I Sea Ice Validation Experiment. The experiment was conducted to verify and validate estimates of total sea ice concentration and multiyear sea ice concentration retrieved from data acquired by the Special Sensor Microwave/Imager (SSM/I), a satellite-borne, multiband, passive microwave imaging system flown as part of the Defense Meteorological Satellite Program (DMSP) sensor suite. KRMS imagery was acquired to provide a ground truth data set for sea ice validation programs sponsored by the Navy (Eppler and Hawkins, 1985) and NASA (Cavalieri and Swift, 1987).

KRMS is particularly well suited to this application. Radiometric characteristics of open water, first-year ice and multiyear ice are unique at the KRMS frequency. Each of the three surfaces can be discriminated unambiguously in KRMS images (Eppler et al., 1986). This, coupled with the good spatial resolution and wide swath of the KRMS, makes the sensor ideal for mapping sea ice type and deriving sea ice concentration.

Ice conditions in four arctic regions were imaged with KRMS over a 6-day period as part of the experiment (Table 1) (Farmer et al., 1989a). Aerial mosaics were flown in the Cape Lisburne region of Alaska (Fig. 1), the Bering Sea between St. Lawrence and St. Matthew islands (Fig. 2), and the Chukchi Sea (Fig. 3). A continuous strip of imagery was acquired along a 2000-km transect extending from Harrison Bay, Alaska, to coastal waters near Ellesmere Island (Fig. 4). Subsequently the Chukchi, Cape Lisburne, and Beaufort data sets were analyzed to derive total sea ice concentration and the concentration of the multiyear fraction of the pack (Cavalieri et al., 1990).

DIGITAL TAPE PRODUCTS

Image data were digitized from analog tapes on an AT-compatible computer running under DOS according to procedures described by Eppler and Heydlauff (1991). A significant portion of this processing was accomplished in a Fairbanks motel room within hours of the completion of the data flights. These data were used to plan subsequent flights. The remaining data were processed at the Naval Oceanographic and Atmospheric Research Laboratory (NOARL) Polar Oceanography Branch Office in Hanover, New Hampshire, after the field experiment was completed.

Table 1. KRMS flights in support of the Navy-NASA SSM/I Validation Experiment.

Region imaged with KRMS	Date	Flight pattern	Coincident data sets
Cape Lisburne	8 March 1989	mosaic	GEOSAT
Beaufort Sea	11 March 1989	transect	JPL-SAR, Goddard AMMR, ERIM-SAR LANDSAT
Bering Sea	13 March 1989	mosaic	JPL-SAR, Goddard-AMMR LANDSAT
Chukchi Sea	14 March 1989	mosaic	JPL-SAR, Goddard-AMMR AVHRR

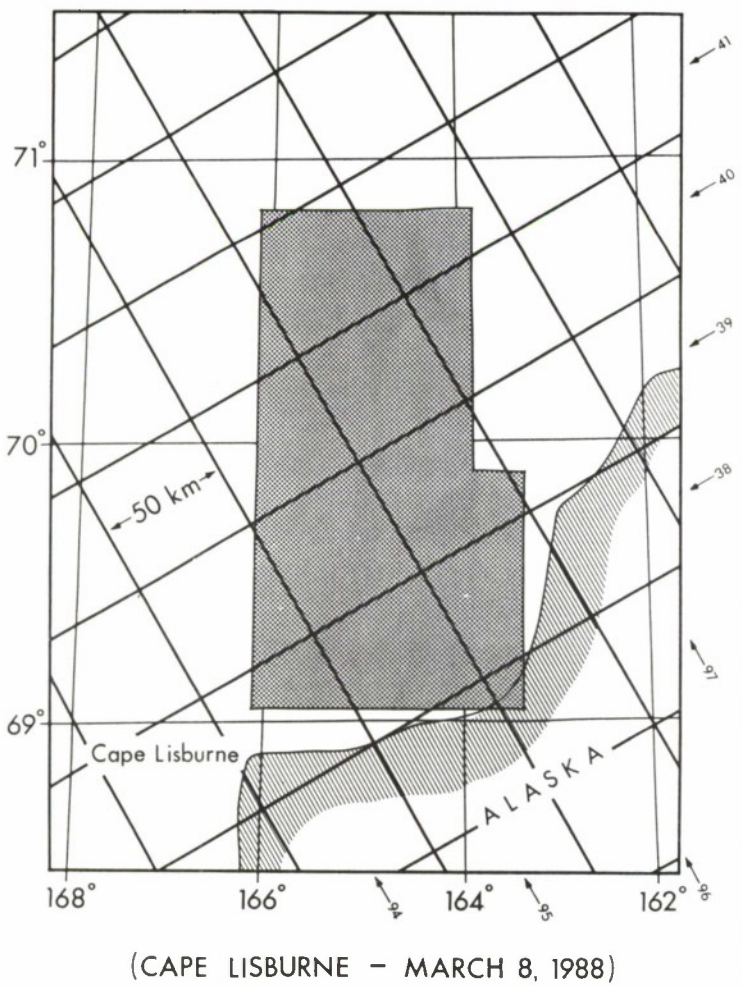

Figure 1. Location map of the KRMS Cape Lisburne mosaic. The shaded box encloses the area imaged in the mosaic. These boundaries are approximate; in most instances the area imaged extends slightly beyond the area shown. Cell boundaries of the NASA SSM/I 50-km grid (heavy lines) are superimposed on the latitude-longitude grid (light lines) Small numbers along the right hand margin and bottom margin refer to row and column coordinates of the NASA grid.

(CHUKCHI SEA - MARCH 14, 1988)

Figure 3. Location map of the KRMS Chukchi Sea mosaic. Refer to Figure 1 for explanation

Raw digital files were copied into a XENIX-based system for subsequent processing and for production of two different sets of archive tapes. The two sets of tapes, both of which are indexed here (App. A and B), contain the same radiometric information but differ in terms of the format in which the information is recorded and in terms of ancillary data recorded in conjunction with KRMS radiances. One set of data was produced using the XENIX "tar" function and contains both pixel intensities and a code that signifies the KRMS antenna used to acquire the data. The other set of tapes was produced using the XENIX "dd" function and contains only pixel intensities. In subsequent sections we use these function names (tar and dd) to distinguish one set of archive tapes from the other. We provide indices to tar tapes and dd tapes in Appendices A and B. The primary difference between tar tapes and dd tapes is the format in which the data are recorded.

tar format

tar is a XENIX/UNIX tape function that copies entire directories to backup media. Data archived with tar are compressed and the file directory structure typical of UNIX and XENIX systems is preserved. Users running under XENIX (and probably UNIX) should be able to restore KRMS image

Figure 4. Location map of the KRMS Beaufort Sea–Ellesmere Island transect. Note that continuous imagery was acquired on both the outbound and inbound legs along this track.

files directly from these tar tapes. However, data stored in this way typically are illegible to non-UNIX/XENIX systems; users running under other operating systems probably will find their experience with the tar tapes somewhat less than rewarding.

dd format

dd is the general purpose file-copying utility provided by XENIX. Data in dd files are preserved in a standard format that is compatible with counterpart I/O utilities resident in most operating systems. KRMS data tapes written with dd reside in binary format in unlabeled files with constant record length and block size. Data written with dd are neither compressed, nor stored in a directory structure. KRMS users on non-XENIX systems (Xontech, Arete), such as the U.S. Army Cold Regions Research and Engineering Laboratory Geological Sciences Branch and the NOARL Remote Sensing Branch, have not encountered significant problems reading KRMS dd files, although some systems require byte swapping.

Images recorded on both sets of tapes are stored by scan in the sequence the scans were acquired by KRMS. One scan consists of radiances measured across the entire 100° field of view by one of three KRMS antennas. Later scans in a file represent data acquired farther downtrack than

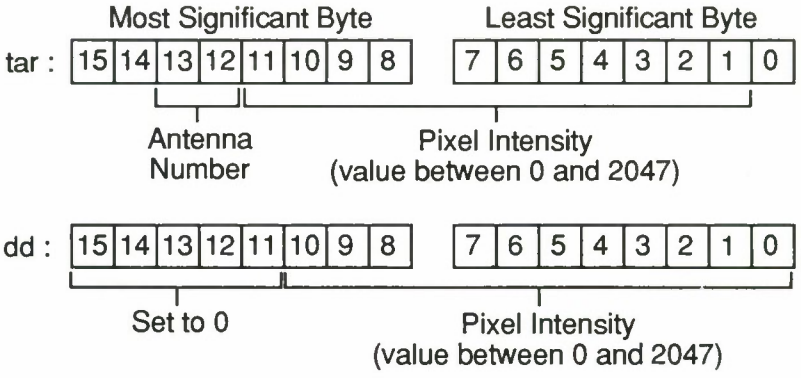

Figure 5. Bit patterns used for pixels recorded on tar and dd archive tapes. On tar tapes, pixel intensity is stored in bits 1–11, and a numeric code that identifies the KRMS antenna used to obtain the data is stored in bits 12 and 13. The antenna code will be an integer, 0, 1, or 2. Bit 0 is forced high (set to 1) by the interface to the digitizing hardware. Bits 14 and 15 float, but generally are 0 and 1, respectively. On dd tapes, the 11-bit pixel intensity has been shifted to the least significant bits (0–10) Bits 11-15 are set to 0.

those from scans that occur at the beginning of a file. Each image consists of 2,048 scans, each scan consists of 512 pixels, and each pixel occupies two 8-bit bytes. The first 1024 bytes in a file, for example, contain unsigned integer values for the 512 pixels that constitute the first scan in the image. Images that are adjacent to one another have been recorded with an overlap of approximately 50 scans. That is to say that approximately the first 50 lines of one image duplicate data in the last 50 lines of the previous image.

Figure 5 shows differences in bit patterns used for pixels on tar and dd tapes. Pixels on tar tapes include a two-bit antenna code that has been stripped from pixels on dd tapes. This code signifies which of the three KRMS antennas was used to acquire data stored in the pixel. The antenna code is not part of the pixel value and must be masked when images are restored from tar tapes. Integral values recorded on both sets of tapes represent relative intensities sensed by KRMS; these data are not calibrated and, in this form, do not correspond directly to radiometric brightness temperatures. See Farmer et al. (1989b) for discussion of methods by which these data can be converted to 33.6-GHz brightness temperatures.

APPENDIX A: INDEX TO tar FORMAT TAPES

Notes on column headings:

Gains and offsets: Those listed here were applied to the analog signal during the digitization process and are independent of gains and offsets given in logs by Farmer et al. (1989) All files digitized with the same gain and offset probably can be calibrated with the same equation. Changes in gain and offset may require that the calibration equation be adjusted.

Number of lines lost: This refers to the minimum number of scans that are missing from each image as a result of asynchronous timing between digitizing rates characteristic of the A/D converter and the rate at which the AT computer can copy data.

Tape numbers: Analog tape number is the number of the analog mission tape on which data were recorded aboard the P-3A aircraft. Digital tape number refers to the number of the archived tar tape.

REPORT DOCUMENTATION PAGE

Form Approved
OBM No. 0704-0188

1. Agency Use Only *(Leave blank)*.	2. Report Date.	3. Report Type and Dates Covered.
	February 1991	Final

4. Title and Subtitle.
Navy-NASA SSM/I Validation Experiment KRMS Data Products

5. Funding Numbers.
Program Element No. 63704N
Project No. 0101
Task No.
Accession No. DN259080

6. Author(s).
D.T. Eppler and L.D. Farmer

7. Performing Organization Names(s) and Address(es).
Naval Oceanographic and Atmospheric Research Laboratory
Ocean Science Directorate
Stennis Space Center, Mississippi 39529-5004

8. Performing Organization Report Number.
NOARL Technical Note 48

9. Sponsoring/Monitoring Agency Name(s) and Address(es).
NASA/Goddard Space Flight Center (671)
Greenbelt, MD 20771

10. Sponsoring/Monitoring Agency Report Number.
NOARL Technical Note 48

11. Supplementary Notes.

12a. Distribution/Availability Statement.
Approved for public release; distribution is unlimited.

12b. Distribution Code.

13. Abstract *(Maximum 200 words)*.

The Navy K_a-band Radiometric Mapping System (KRMS) was used to acquire high-resolution passive microwave imagery of sea ice in the Bering, Chukchi, and Beaufort Seas during the joint Navy-NASA SSM/I validation experiment in March 1988. Additionally, imagery of rivers and lakes was acquired in the vicinity of Fairbanks, Alaska, on two different days during this period. Information presented here constitutes an index to digital tapes of KRMS imagery acquired during these flights.

14. Subject Terms.
SSM/I, KRMS, Sea Ice, Validation

15. Number of Pages.
45

16. Price Code.

17. Security Classification of Report.	18. Security Classification of This Page.	19. Security Classification of Abstract.	20. Limitation of Abstract.
Unclassified	Unclassified	Unclassified	SAR
