ABSTRACT

The need for data management standardization has been clearly identified by the Office of the Secretary of Defense as a means to realize savings in the \$9 billion spent annually on information technology in DoD and to further interoperability and sharing of information among systems. Most efforts thus far have been directed at standardizing data elements, the lowest level in the hierarchy of data, as a foundation for standardizing Management Information Systems within DoD. In this thesis, we propose extending the standardization effort to the schema level of an organizational unit. We accomplish this by examining the administrative functions carried out onboard a generic Navy ship and developing a data model (view) for each function. The functions addressed in this thesis are Personnel, Training, Ship Secretary, Welfare and Recreation, Command Career Counselor, Public Affairs Officer, Educational Services Officer, Master at Arms, and Legal. The separate views are then integrated to form a global, high level, conceptual data model. This complex view is then simplified by creating higher levels of abstraction using an entity clustering technique.

I. INTRODUCTION

A. BACKGROUND

The Office of the Secretary of Defense (OSD) has recognized the need to reduce an estimated \$9 billion spent annually on collecting and processing data into usable forms of mission essential information. To achieve savings in resources invested on information technology, DoD Corporate Information Management (CIM) was established in October 1989 in order to "enhance the availability and the standardization of information in common areas and to provide for the development of integrated Management Information Systems." [Ref. 1]

Information standardization allows for sharing of data between functional units and greater interoperability and integration between databases and enhances the effort of managing the information. Standardization also facilitates the accomplishment of the following goals: [Ref. 1]

1. Consolidating multiple systems that meet the same functional requirements.
2. Reducing unnecessary redundancy.
3. Developing common data requirements and formats to enhance interoperability.
4. Reducing the amount of annual expenditures associated with information technology.

To illustrate the importance of standardization, consider a possible Navy mission: the search and rescue of a disabled ship at sea. When tasked, the disabled vessel's last known position is provided to the Carrier Battle Group (CVBG) either from shore or from another ship (civilian or military). Patrol

aircraft or ships are designated and, provided with a description and general location of the vessel, are dispatched to conduct the search and rescue. Aircraft and ships working together exchange data about search patterns, weather conditions, geographic positions and rescue procedures to coordinate their efforts and minimize time. When located, the vessel's position, material and personnel condition and other amplifying data are transferred between search units and the group commander. Without standard conventions for terminology, tactics or operations, the different units would have to expend much more time and effort to accomplish the same amount of data exchange in order to fulfill their mission.

In addition to a unit's operational mission, there are several administrative functions that must be accomplished in order to meet other recurring requirements. To illustrate this point, consider the required monthly reports submitted by Navy units to superiors within their respective "chains-of-command." The reports from different units contain the same data, but may vary in format, depending on where the report is sent. In some cases data elements are not standardized between reports. A typical example is a data element named "birth date" or "date of birth." These are two different data element names for the same data item. To further complicate the matter, this data can be stored in one of many different formats (i.e., DD-MM-YY, YY-MM-DD, MM-DD-YY). This lack of standardization creates unnecessary requirements for separate

record maintenance and report preparation. In some cases, separate reports, containing the same data but in different formats, must be generated to satisfy reporting requirements. This situation often leads to redundant record keeping and the inherent problems of control, integrity and accuracy of data. The standardization concept becomes more important when applied to afloat units (ships, staffs, air squadrons) that must interface with several different shore organizations, whether military (DoD), federal (e.g., USCG, FAA, DEA) or civilian (e.g., emergency services, port services).

Efforts thus far have been directed at standardizing data elements, the most basic level in the hierarchy of data, as the foundation for standardizing Management Information Systems within DoD. An automated Data Dictionary System (DDS) has been developed by the Army to provide on-line access to all data elements created using the published data element naming standards. [Ref. 2]

While the standardization of data elements is an important step in promoting data sharing, facilitating data integration and interoperability, a higher level of standardization, at the schema level, is necessary to better accomplish these goals. Since the organizational structure and functions of common areas (e.g., administration) within the organizational units of each service are very similar, schema level standardization is particularly attractive.

Consider, for example, the administrative functions and organization of a Navy unit. Regardless of size or operational mission, the administrative organization and functions of Navy units are essentially the same as required by the **STANDARD ORGANIZATION AND REGULATIONS MANUAL OF THE U.S. NAVY** (OPNAVINST 3120.32). As a result, the data requirements to support these functions are essentially the same. Larger units have more functions and greater composition at the various levels of the organization structure (e.g., the number and designation of work groups). For example, a combatant ship might have four departments (Operations, Weapons, Engineering and Supply), while an aircraft carrier has several more departments (e.g., Air, Deck, Medical, Legal, Repair, etc.).

Standardization of data at the schema level could greatly improve data exchange (e.g., personnel, material, technical) between Navy units by allowing electronic transfer of data between databases. Personnel transfers, transfer of technical and material data between units (ship-ship, ship-shore), and updates to a unit's databases (e.g., technical info, supply) could be accomplished with a significant improvement in timeliness, data accuracy and integrity.

B. OBJECTIVE AND SCOPE

This thesis develops a high level conceptual data model of a subset of the administrative functions common to a typical naval ship. The functions investigated in this thesis include

PERSONNEL, TRAINING, SHIP SECRETARY, WELFARE AND RECREATION (WELREC), COMMAND CAREER COUNSELOR (CCC), PUBLIC AFFAIRS OFFICER (PAO), EDUCATIONAL SERVICES OFFICER (ESO), MASTER AT ARMS (MAA) and LEGAL. The data required to perform each function is captured in an Entity Relationship Diagram. These diagrams include the entities, attributes, relationships and constraints required to perform each function. This method results in standardizing the data elements, which is clearly an important step in standardizing Management Information Systems within DoD. Standard data elements are used in developing the Entity Relationship Diagrams. These diagrams are then combined into a single, nonredundant, global schema that represents the global data required for these functions.

C. METHODOLOGY

To accomplish our objective of developing a high level conceptual data model of the specified administrative functions, we use the following four step approach. For each function we:

1. Determine and analyze data user requirements, data items and data flows.
2. Develop a conceptual model to describe entities, data items, relationships and constraints.
3. Compile a data dictionary that defines and describes all data items.
4. Integrate the resulting subschemas into a single, non-redundant schema.

D. ORGANIZATION

This thesis is organized as follows. Chapter II describes the standard shipboard organization and discusses the administrative functions to be examined in this study. Chapter III discusses this data modeling approach. Chapter IV applies this data modeling approach to the administrative functions described above. Chapter V takes the Entity Relationship Diagram for each administrative function and integrates them to form a global, nonredundant, conceptual schema. A high level abstraction of this global schema is then formed by using the entity clustering approach. Chapter VI provides a summary of our experience using the methodology and reviews conclusions and lessons learned during the course of this study.

II. STANDARD SHIP ORGANIZATION AND FUNCTIONS

A. SHIP ORGANIZATION

The standard organization of ships is based on the requirements for conducting wartime missions. In order to meet the requirements of an operational environment, a ship is organized according to function (e.g., engineering and operations). This organization consists of functional departments which are divided into divisions and further subdivided into work centers. The number of departments within a ship varies with ship type. For example, large ships such as aircraft carriers have many more departments than smaller ships such as frigates or destroyers. However, the organizational structure is basically very similar, regardless of ship type and number of departments.

A ship's organization has two aspects. First, the fixed aspect deals with the structure of the organization and can be illustrated in the form of organization charts and diagrams. Figure 1 illustrates a typical organization chart for a ship. Second, the dynamic aspect deals predominantly with the human elements of the organization. Figure 2 illustrates this second aspect. With regard to the second, human aspect of the ship's organization, the following discusses the delineation of authority and responsibility for people assigned to various positions within the shipboard organization.

1. Commanding Officer

The Commanding Officer is charged with absolute responsibility for the safety, well-being and efficiency of his/her

Figure 1: Standard Shipboard Organization

Figure 2: Departmental Organization

command. The duties and responsibilities of the Commanding Officer are established by U.S. Navy Regulations, general orders, customs and tradition.

2. Executive Officer

The Executive Officer is the direct representative of the Commanding Officer and is primarily responsible, under the Commanding Officer, for the organization, performance of duty and good order and discipline of the entire command.

Assistants may be assigned to the Executive Officer to aid in the accomplishment of specific command administrative functions (i.e., Legal, Safety, Security, Training, Public Affairs, etc.). Their duties may be primary or collateral. When performing duties on a collateral basis, officers and petty officers acting as assistants to the Executive Officer report directly to him/her, regardless of their primary assignment (department, division) in the organization. Figure 3 illustrates the executive assistants examined in this thesis.

3. Head of Department

The Department Head is the representative of the Commanding Officer in matters pertaining to his/her assigned department, reporting directly to the Commanding Officer concerning departmental matters whenever such action is necessary. The Commanding Officer and, as appropriate, the Executive Officer, will be informed of the material and operational readiness of assigned equipment and shipboard spaces, status of equipment repairs, crew

Figure 3: Executive Assistants

training, and personnel and material needs of the department. An officer may head more than one department on smaller ships.

Assistants required for the proper performance of department functions may be assigned to each department concerned. Specific functions may include Administration, Supply, Training and Maintenance.

The Department Head reports to the Executive Officer on all administrative matters and advises the Executive Officer of reports to the Commanding Officer. Immediate subordinates assigned to the Department Head report directly to him/her.

Within a given department, there may be more than one division. For example, within the Combat Systems department, there may be separate divisions for sonar, gunnery, missiles and electronic repair.

4. Division Officer

A Division Officer is assigned by the Commanding Officer to command a division within a department of the unit's organization. He/she is responsible, under the Department Head, for the operational and maintenance duties assigned to the division as well as the training, conduct and welfare of personnel assigned to the division, following regulations and orders of the Commanding Officer and other superiors. The Division Officer must stay informed of the capabilities and needs of each subordinate, and within his/her authority, take actions to maintain the efficiency of the division and welfare and morale of subordinates.

The Division Officer reports to the Department Head regarding the performance of his/her assigned duties. Within a division, the following personnel report to the Division Officer:

- The junior division officer (when assigned) regarding assigned duties.
- Technical or material assistants (when assigned).
- The leading chief petty officer (LCPO) or leading petty officer (LPO), for the daily operations of the division.

5. Leading (Chief) Petty Officer (LCPO/LPO)

The senior chief petty officer or petty officer within a division is normally assigned duties of Leading (Chief) Petty Officer (LCPO/LPO). He/she assists the Division Officer in the administration, supervision and training of division personnel. The division LCPO/LPO reports to the division officer (or junior division officer when assigned). A division may have more than one work center. For example, within the Sonar division of the Combat Systems department, there may be a work center for each sonar system: the torpedo weapon system and other weapon systems as necessary.

6. Work Center Supervisor (WCS)

The work center supervisor is normally the senior petty officer in charge of a specific operational or maintenance group within a division and will be responsible to the Department Head, via the Division Officer and LPO, for Material, Maintenance and Management (3-M) system operation and training within the work center. The work center supervisor reports to the division LPO and

the department 3-M assistant. All personnel assigned to the work center report to the work center supervisor.

B. DATA REQUIREMENTS AND DATA FLOW

There are two types of data requirements within the ship's organization. The first type is operational data such as ship exercises and unit readiness reporting. The second type is administrative data requirements necessary for the daily functions of the ship, such as personnel, education and training programs. The data flows for these types of data/information within a ship can be characterized in two ways; intra- and inter-departmental. Intra-departmental data flow is contained within the structured departmental boundaries previously described. For example, information about the training status of a given work center would move from the individual through the work center supervisor to the Division Officer, via the division LPO, and continue through the Department Head to the Executive Officer and the Commanding Officer. This data flow path is known as "THE CHAIN OF COMMAND" and is bi-directional (top-bottom / bottom-top). This pattern can be characterized by a single source and several receivers of a given data item.

The second, and less structured, flow path is the inter-departmental data flow. In this method, several sources provide data to a relatively few number of receivers. The data flows across several departmental boundaries at all levels within the unit. This multi-directional pattern is the least tangible but most often used data flow pattern in a unit. As an example, if a crew member goes

to Captain's Mast and is awarded a reduction in rate, the Personnel Officer must officially change the member's rate; the Career Counselor and the Educational Services Officer note the member's reduced rate and subsequent impact on advancement and/or reenlistment programs; and the Security Officer must be informed to take appropriate action regarding the member's participation in the PRP and/or security force.

Administrative data is the kind of inter-departmental data that we are most interested in modeling, as it is the most commonly shared data within the organization. Input and utilization of this data by users from different departments would be significantly improved if the data elements could be identified and modeled for use in a central repository or a database on board the ship. A central database would facilitate improved security and integrity of the data and provide for timely and accurate information available to multiple users simultaneously. A shipboard database could be updated by internal as well as external sources (e.g., Manpower documents, technical data, etc.).

We examined the administrative data requirements on board a typical Navy ship and identified the data maintained by the Executive Officer's assistants for various administrative functions to contain the majority of the data we want to model.

C. ADMINISTRATIVE FUNCTIONS

Administrative data requirements are routine for every position in the organization, regardless of department. In order to accommodate the efficient execution of these administrative functions, the

Executive Officer assigns administrative executive assistants to perform them. These administrative assistants may be either officers or enlisted personnel. Administrative duties may be collateral duties in addition to a member's primary function on board the ship. For example, the Personnel Officer may be assigned collateral duties such as Legal Officer and Welfare and Recreation Officer. Other administrative duties, such as the Command Career Counselor, are assigned as primary duties to a member of the crew. All department heads and executive assistants report directly to the Executive Officer with regard to administrative matters.

This study focuses on the following administrative functions common to any ship, regardless of class: PERSONNEL, TRAINING, SHIP SECRETARY, WELFARE AND RECREATION, COMMAND CAREER COUNSELOR, PUBLIC AFFAIRS OFFICER, EDUCATIONAL SERVICES OFFICER, MASTER AT ARMS, and LEGAL.

1. PERSONNEL

This function stores and maintains information on a member, his identification, citizenship, assignment history, life insurance, and emergency data. It also maintains information on a member's dependents and their dependent identification. Information on the member's assigned billet, assignment history, orders, leave, awards, prior military service, and administrative remarks are also tracked in the personnel function.

Since a member could be either officer or enlisted, the personnel function tracks information which is specific to each. For enlisted personnel, this information includes enlistment

contract, enlistment extensions and performance evaluations. An officer will have his promotions and his designators tracked by this function.

2. TRAINING

This function covers different aspects of crew training and qualifications. Training is accomplished by all organizational units aboard the ship, with the Training Department monitoring and maintaining the records. This function allows the tracking of quotas for the scheduling of off-ship schools; school and Naval Enlisted Classification (NEC) requirements; PQS (Personnel Qualification System), which is concerned with watchstation training and qualification assigned to every member of the crew (officer and enlisted); and the number of people required to be qualified for each PQS item, special certifications, and training lectures. It also tracks inspection requirements and Type Commander (TYCOM) required exercises which are performed by the departments.

3. SHIP SECRETARY

This function utilizes data necessary for the maintenance of the command's administrative library, correspondence files, collateral duty assignments, daily schedule items, and tickler items. It also tracks information regarding the ship's guests, transfer addresses of members, and the primary duty assignments to the different departments, divisions, and work centers.

4. WELFARE AND RECREATION

This function keeps information on ticket receipts and sales for special functions like ball games or theater tickets. It

also keeps track of equipment inventories for the fixed and issuable recreation equipment.

5. COMMAND CAREER COUNSELOR (CCC)

This function monitors enlisted career intentions via interviews, duty preferences, school preferences, performance development boards, and retention programs. It also tracks an enlisted member's transfer information.

6. PUBLIC AFFAIRS OFFICER (PAO)

This function stores information concerning press releases, command history, command CO and XO history, and hometown news release information on individual members.

7. EDUCATIONAL SERVICES OFFICER

The Educational Services Officer (ESO) function utilizes data related to the education of members on board the ship, both duty-related courses and off-duty education. It tracks information on the advancement requirements of the enlisted members. This information includes military leadership exams, performance tests, advancement exams, and prior advancements. Armed Services Variable Aptitude Battery (ASVAB) exams, Naval Enlisted Classification codes and special study skills are also kept by this function.

8. MASTER AT ARMS

This function allows the tracking of the command's urinalysis program and the custody and disposition of investigation evidence.

9. LEGAL

This function deals with data associated with the legal matters specific to a member and also to the command in general. The information associated with a member includes search consents, civilian arrests, captain's masts, courts martial, legal encounters, Naval Investigative Service (NIS) investigations, administrative separations, administrative discharge boards, and unauthorized absences. The information associated with the command includes Privacy Act request releases, Freedom of Information Act (FOIA) releases, search authorizations, and congressional inquiries.

The generic shipboard organization and administrative organization have been discussed, with administrative functions specific to this study described. In the next chapter we will discuss the data modeling approach to be used on these administrative functions.

III. DATA MODELING

A. DATA MODELING APPROACH

The data modeling approach is a way to describe data from the user's point of view, which is independent of how that data is stored and utilized. The goal of data modeling is to capture the data requirements of an organization in a simple and understandable way to both the designer and the end-user. The following is a brief description of the steps involved in data modeling as applied to modeling data of a generic ship. A graphical representation of these steps as it applies to database design is shown in Figure 4.

1. Requirements Collection and Analysis

In order to effectively design the schema, we must know the uses of the database and the expectations of the users. These requirements are collected and analyzed in this step. There are several alternative methods for collecting the requirements. The following are the most commonly used approaches in performing this step: (These are discussed in Ref. 3.)

a. Identification of User Groups and Application Areas

The key individuals must be identified from each user group to assist with the requirements collection and specification. Each major application area and the user groups that will use the database must also be identified.

b. Review of Existing Documentation

Any existing documentation for the applications must be reviewed and analyzed. This documentation, which includes policy manuals, forms, reports, and organization charts, is examined to

Figure 4: Database Design Method

determine if it contains information which should be included in the database.

c. Analysis of the Operating Environment and the Processing Requirements

The current and future use of the processing requirements of the system must be analyzed. The types and frequencies of transactions, including their input and output data, are analyzed along with the flow of information within the system. These provide important information about the frequency and volume of updates to the database.

d. Questionnaires and Interviews

Potential users of the database should be given written questionnaires regarding their priorities and the importance they place on the different applications. The key individuals should be interviewed in order to obtain more detailed information from them about the worth of the information and the priorities.

In our application, the administrative functions of a generic ship were examined using all of the above mentioned methods, except for questionnaires, to determine the data required to support each function.

2. Conceptual Design

The conceptual schema describes the data requirements of the users in a high level model, giving detailed descriptions of the entities, their attributes, relationships between these entities, and constraint on the relationships. Because implementation details are ignored at this point, this schema is easier for

non-technical users to understand and database designers can concentrate on describing the data requirements with no concern about storage requirements. This step also involves consolidating multiple views into a single, nonredundant, global schema. This is required when more than one person, each with a different perspective of the world, is involved in requirements collection and analysis. A high level data model is used in this step because it is more expressive and general than data models of individual DBMS's. [Ref. 3] We have used the Entity Relationship Model (ERM) as our high level conceptual model. A detailed description of ERM is given in Section B.

3. Data Model Mapping

After this conceptual design (or schema) is completed, it is transformed from a high level data model to the implementation data model. This transformation is dependent on the data model that will be used for implementation (e.g., relational, hierarchical, network) rather than a specific DBMS. For example, if we decide to use a relational DBMS for the final implementation, then a system independent relational schema will be the output of this phase. External schema (views) for each application using the database are usually defined during this phase.

4. Physical Design

The final step is converting this conceptual schema into the Physical Design, which specifies internal storage structures and file organizations for the specific DBMS used. [Ref. 3]

This thesis will focus on the first two steps in this data modeling approach. The administrative functions of a generic ship will be analyzed and the requirements will be collected for each function. A high level data model will be developed for each function, and the independent views of these functions will be integrated into a single, nonredundant, global schema.

The following section discusses the Entity Relationship Model in detail.

B. ENTITY RELATIONSHIP MODEL

The Entity Relationship model is used as a technique for high level conceptual data modeling. It consists of entities and their attributes and the relationships between the entities. The basic constructs of the Entity Relationship Model are depicted in Figure 5. The concepts contained in this discussion are derived from Reference 4.

An entity is a "thing" in the real world which can be distinctly identified. It is usually a person, place, thing, or event of informational interest and is represented by a rectangle. A particular occurrence of an entity is called an entity instance. A MEMBER is an entity and an instance of this entity would be "LT John Smith." Each entity has specific attributes which further describe it. For example, a member may be described by his name, address, phone number, sex, age, etc. There is at least one attribute which distinctly identifies that entity: this is called the key attribute. For example, social security number is the key attribute for a MEMBER. A weak entity is a type of entity which

Figure 5: Basic Constructs in Entity Relationship Diagram

depends on the existence of another entity type. For example, **DEPENDENT** cannot occur by itself in an organization's database; rather it depends on the existence of the entity **MEMBER**. A weak entity is represented by a double rectangle.

Relationships represent association among entities. For example, **ASSIGNED** is a relationship between a **MEMBER** and an **IDENTIFICATION**. A relationship is represented by a diamond-shaped box with lines connected to the related entities. Relationships can be classified according to the type of mapping between entities. These are one-to-one, one-to-many and many-to-many. As Figure 5 shows, a one-to-one relationship is represented by a straight line between the entities and the relationship. A one-to-many relationship is represented by a straight line between the single entity and the relationship and a straight line between the relationship and the entity with multiple instances, with a crow's foot on the end next to the entity. A many-to-many relationship has crow's feet on the lines next to both entities. Relationships can also be classified according to whether they are mandatory or optional. If an occurrence of an entity must always exist for the other entity to be included in the relationship, then it is mandatory. If the occurrence need not exist, it is optional. For example, the relationship between **MEMBER** and **DEPENDENT** is mandatory-one-to-optional-many. This means the **MEMBER** may have one or more **DEPENDENTS**, but if a **DEPENDENT** exists, it must belong to one **MEMBER**. It is important that the designer identify the type of mapping and existence constraints of relationships and include them in the

entity relationship diagram. An optional relationship is represented by an "O" on the connecting line between the entity and the relationship, next to the entity that is optional. A mandatory relationship is represented by a straight line across the connecting line between the entity and the relationship, next to the entity that is mandatory. Figure 5 illustrates how these relationships are represented.

Generalization/Specialization (or ISA) relationships are also represented in an Entity Relationship Diagram. Specialization occurs when an entity is partitioned by different values of a common attribute; this is also known as a superclass and subclass relationship. For example, MEMBER is a generalization of OFFICER and ENLISTED service members. MEMBER is the superclass and OFFICER and ENLISTED are the subclasses. This is denoted by the ISA relationship, which is read MEMBER is a(n) ENLISTED. Both OFFICER and ENLISTED share common attributes, such as social security number or address, but both have distinct attributes associated only with that generalization/specialization. For example, OFFICER would have the attribute RANK, while ENLISTED would have the attributes RATE and RATING. ENLISTED would also have advancement exam data elements that an OFFICER would not have. A MEMBER can be either an OFFICER or an ENLISTED. If the MEMBER were an OFFICER, he would have all the attributes of MEMBER plus the attributes of OFFICER. If he were an ENLISTED he would have all the attributes of MEMBER plus the attributes of ENLISTED. In a generalization, a MEMBER would have to be either an OFFICER or an ENLISTED. In a

disjunct specialization, a MEMBER would have the option of being OFFICER, ENLISTED, or neither. For example, a MEMBER could be a civilian employee and not included in OFFICER or ENLISTED. This is a disjunct relationship, because a MEMBER could be an OFFICER or an ENLISTED, but not both.

There is also an overlapping specialization. This is where an entity can be a member of more than one subclass. For example, a PERSON could be a generalization of FACULTY, STAFF and STUDENT. A PERSON could be a STAFF member and a STUDENT at the same time.

[Ref. 4]

In the next chapter, we apply the Entity Relationship Methodology discussed above to develop a high level conceptual model for the administrative functions studied in this thesis.

IV. CONCEPTUAL DESIGN

In this chapter we apply the data modeling approach presented in the previous chapter to modeling the data requirements for the following functions: PERSONNEL, TRAINING, SHIP SECRETARY, WELFARE AND RECREATION (WELREC), COMMAND CAREER COUNSELOR (CCC), PUBLIC AFFAIRS OFFICER (PAO), EDUCATIONAL SERVICES OFFICER (ESO), MASTER AT ARMS (MAA), and LEGAL. In the following sections, we present in detail the Entity Relationship Diagram for each function. In the text that follows, an entity is represented by uppercase words; mandatory relationships will be stated with "must," and optional relationships will be stated with "may."

A. PERSONNEL

The PERSONNEL administrative function handles the majority of the information specific to a MEMBER. The entity relationship diagram for this function is located in APPENDIX A. A MEMBER IS A(n) OFFICER or an ENLISTED. A MEMBER entity describes a service member and is identified by the member's social security number; it also includes name, address, sex, etc. An OFFICER entity has distinguishing attributes such as rank, commission date, commissioning source, year group, etc. An ENLISTED entity has attributes such as rate, rating, end of active obligated service, etc. Each MEMBER must be assigned an IDENTIFICATION which is identified by the ID card number, and contains issue/expiration date, Geneva category, etc. A MEMBER may sponsor one or more DEPENDENTS. The DEPENDENT entity is identified by the dependent first and middle names and contains information on that DEPENDENT such as last name,

address, relation, sex, etc. A DEPENDENT must also be assigned a DEPENDENT IDENTIFICATION which contains privileges authorized, expiration date, issue date, etc. Each MEMBER may be granted many LEAVE periods. A LEAVE entity contains information such as leave start and end dates, leave address and phone, travel mode, leave type, etc., and a leave control number as its identifier. A CITIZENSHIP must be obtained by a MEMBER. The CITIZENSHIP entity contains current citizenship, naturalization date, naturalization place, etc. GROUP LIFE INSURANCE may be selected by a MEMBER. This entity contains information about the member's GROUP LIFE INSURANCE policy such as beneficiary name, beneficiary payment, entitlement effective date, etc. A MEMBER must be authorized at least one set of ORDERS throughout his career. An ORDERS entity is identified by order number, and contains attributes associated with ORDERS like order type, reason for orders, start and end dates, etc. A unit (e.g., a ship) is assigned BILLET allowances, and a MEMBER must be assigned to one of the ship's BILLETS. The BILLET contains billet number, required rate, etc. The relationship "assigned to" contains the MEMBER's projected rotation date and his prospective gain date. A MEMBER may have many instances of PRIOR MILITARY SERVICE. The information in this entity includes from and to service dates as the key attributes, military service branch, service discharge type, etc. A MEMBER may be administered many ADMINISTRATIVE REMARKS, which contain a date as the key attribute and a memo attribute for miscellaneous information. A MEMBER must keep EMERGENCY DATA which stores next of kin information in case of an

emergency. A MEMBER must maintain one or more instances of an ASSIGNMENT HISTORY ITEM, an instance of which contains a past command assignment and associated dates; the start date is the key attribute. He may be presented many AWARDS for exceptional duty. The AWARD entity contains the award type and date as the key attribute and includes award name and award authority. An OFFICER may earn many DESIGNATORS. This entity contains the designator type, and current rank, with designator date as the key attribute. An OFFICER must also obtain one or more PROMOTIONS. This entity contains the promotion type, promotion rank, etc., with promotion date as the key attribute. An ENLISTED must make an ENLISTMENT CONTRACT. The ENLISTMENT CONTRACT contains enlistment date, enlistment duration etc. An ENLISTED may also sign ENLISTMENT EXTENSIONS. This entity is identified by the extension date, and contains extension term, extension reason, etc. An ENLISTED must have one or more PERFORMANCE EVALS which contain eval date, eval grades, and eval rank; the eval date is the key attribute.

B. TRAINING

Training is accomplished by all organizational units aboard the ship, with the Training Department monitoring and maintaining the records. Most training is focused on the individual; however, there are certain training requirements that are accomplished by a department as a whole. The entity relationship diagram for this function is located in APPENDIX B.

One or more INSPECTION REQUIREMENTS must be performed by one or more DEPARTMENTS. An instance of an INSPECTION REQUIREMENT is

identified by the inspection description and date due, and also contains an inspection department name, inspection item, inspection last date, etc. Many DEPARTMENTS may perform many TYPE COMMANDER (TYCOM) EXERCISES, an instance of which includes exercise number, as the key attribute, exercise periodicity, exercise dates, etc.

Many SCHOOL/NEC REQUIREMENTS may be tracked by TRAINING. An instance of a SCHOOL/NEC REQUIREMENT contains school/NEC number, as the key attribute, school applicable NEC, school/NEC number required, etc. TRAINING may track many SCHOOL QUOTAS, which contain information such as quota school name, quota school date, etc., with the quota control number as the key attribute. TRAINING must monitor many PQS ITEMS. The attributes contained in this entity are PQS item number, as the key attribute, and the number of people required for that item. TRAINING may oversee many CERTIFICATIONS which may be achieved by many MEMBERS. An instance of a CERTIFICATION is identified by the certification name and date last certified, and includes certification requalification date and remarks. The relationship "achieved by" contains the achieved date and remarks. A MEMBER may be assigned duties as the TRAINING Officer. TRAINING may coordinate many TRAINING LECTURES which must be attended by one or more MEMBERS. A TRAINING LECTURE instance is identified by training lecture number, and includes training lecture periodicity, training lecture instructor, etc. The relationship "attends" contains the MEMBER's attendance date and attendance remarks. A MEMBER may complete many PERSONNEL QUALIFICATION STANDARDS (PQS). An instance of PQS includes information such

as PQS title, as the key attribute, PQS mission area, PQS naval education training (NAVEDTRA) number, etc.

C. SHIP SECRETARY

The SHIP SECRETARY function handles the administrative requirements for the Executive Officer. The entity relationship diagram for this function is located in APPENDIX C. One or more TICKLER ITEMS must be tracked by the SHIP SECRETARY. These TICKLER ITEMS must be performed by one or more DEPARTMENTS and contain tickler item name, as the key attribute, periodicity, last performed date, etc. One or more COLLATERAL DUTYs are tracked by the SHIP SECRETARY and may be assigned to many MEMBERS. A COLLATERAL DUTY entity contains the collateral duty name, which is the key attribute. The "assigned to" relation contains the date assigned attribute. One or more DEPARTMENTS are responsible for one or more COLLATERAL DUTYs. DEPARTMENTS are identified by the department name. A MEMBER may be assigned as the SHIP SECRETARY. The SHIP SECRETARY must file one or more CORRESPONDENCE ITEMS, which contain such attributes as item serial number and date, both comprising the key attribute, description, standard subject identification code (SSIC), etc. The SHIP SECRETARY may track many SHIPS GUESTs. The attributes contained in SHIPS GUEST include guest name, as the key attribute, command, duty phone, etc. The SHIP SECRETARY must keep one or more ADMIN LIBRARY ITEMS which may be checked out by one or more MEMBERS. An ADMIN LIBRARY ITEM is identified by the instruction/publication number, and includes item description, item issue date, etc. The "checks out" relationship contains the check out

date and check out return date. A MEMBER may provide a TRANSFER ADDRESS; this must occur upon the MEMBER's transfer from the command. This entity consists of the transfer command UIC, transfer command name, home address, etc.

The SHIP SECRETARY function also oversees the shipboard overall organization, i.e., who is responsible to whom. A DEPARTMENT must be headed by a MEMBER. A DEPARTMENT may have one or more DIVISIONS. The DEPARTMENT entity consists of department name, department head name, department location, etc., with the department name as the key attribute. A MEMBER must run a DIVISION. The DIVISION entity contains division name, division officer name, division location, etc., with the division name as the key attribute. A DIVISION may consist of one or more WORK CENTERS. A WORK CENTER must be supervised by a MEMBER. The WORK CENTER entity contains work center name, work center supervisor name, work center number, etc., with the work center name as the key attribute. One or more DAILY SCHEDULE ITEMS must be met by one or more DEPARTMENTS, DIVISIONS and WORK CENTERS. The DAILY SCHEDULE ITEM entity consists of item date, item name, person responsible, etc., with the item date and name as the key attribute.

D. WELFARE AND RECREATION

The WELFARE AND RECREATION function handles recreation services such as ticket sales and recreation equipment. The Welfare and Recreation entity relationship diagram is in APPENDIX D. The attributes of the WELFARE AND RECREATION entity are the location and phone number of the Welfare and Recreation Officer. A MEMBER

may be the WELFARE AND RECREATION Representative. WELFARE AND RECREATION may receive many TICKET BLOCKs, an instance of which is a group of tickets to a particular function. This entity is identified by ticket block function and ticket block receipt date, and includes attributes such as number of adult and child tickets, etc. A TICKET BLOCK must contain at least one TICKET. TICKET information includes ticket serial number, ticket purchaser name, ticket sale price, etc., with ticket serial number as the key attribute. WELFARE AND RECREATION may track many items of EQUIPMENT, which is either ISSUABLE or FIXED. An instance of EQUIPMENT is identified by equipment serial number and includes attributes such as equipment location, equipment description, etc. ISSUABLE attributes include quantity and quantity last updated date. The attribute specific to FIXED equipment is fixed equipment acquisition age. Many ISSUABLE equipment items may be checked out to many MEMBERS. The attributes applicable to the "check out" relationship are equipment checked out date and equipment checked in date.

E. COMMAND CAREER COUNSELOR (CCC)

The CCC function monitors ENLISTED programs and career and transfer desires of the ENLISTED members. The entity relationship diagram of this function is in APPENDIX E. TRANSFER INFORMATION must be kept on an ENLISTED. This information includes such items as career intentions, last deployment length and return date, household effects info, etc. An ENLISTED may attend many PERFORMANCE DEVELOPMENT BOARDS (PDB's) which evaluate requests for striking for (entry into) a rating or for applying for a special

program (e.g., a commissioning program). A PDB entity has the following attributes: PDB date, which is the key attribute, PDB approval (Y/N), PDB comments, and PDB reason. An ENLISTED may participate in many CCC INTERVIEWS. An instance of a CCC INTERVIEW includes such attributes as interview date, which is the key attribute, interview type, interview comments, etc. An ENLISTED must have a SCHOOL PREFERENCE which indicates the service school name he prefers, and the duty type, duty location, etc., for which he is willing to extend obligated service in order to get a particular school. An ENLISTED must submit many DUTY PREFERENCES throughout his career. A DUTY PREFERENCE is identified by duty type and submission date, and includes attributes such as duty/activity code, type and location (for first, second and third choices) that he prefers, etc. An ENLISTED may join many RETENTION PROGRAMS during his career. An instance of a RETENTION PROGRAM includes attributes such as retention program name, description, minimum and maximum age allowed, etc., with retention program name as the key attribute.

F. PUBLIC AFFAIRS OFFICER (PAO)

The PAO function is the interface between the ship and the media. The PAO entity relationship diagram is located in APPENDIX F. Many PRESS RELEASES may be submitted by the PAO. A PRESS RELEASE contains the press release date, which is the key identifier, description, and destination. The PAO may file many COMMAND HISTORY ITEMS for future use. The information stored in this entity is the item date, which is the key attribute, and the item description.

The PAO must track the many COMMAND CO/XO's. An instance of this entity contains the CO or XO name, the from and to dates of the CO or XO, and an indicator to indicate if he was a CO or XO. The from date and indicator uniquely identify one instance of this entity. The COMMAND CO/XO could be an OFFICER on the ship. A MEMBER may be assigned as the PAO. The PAO may utilize many instances of HOMETOWN INFO of which one or more MEMBERS have. An instance of HOMETOWN INFO includes hometown city, address, newspaper name, etc., and is uniquely identified by city and state.

G. EDUCATIONAL SERVICES OFFICER

The EDUCATIONAL SERVICES OFFICER (ESO) handles the information pertaining to the education of the members aboard the ship and the advancement requirements of the enlisted members. This entity relationship diagram is located in APPENDIX G. A MEMBER may accomplish several instances of OFF DUTY EDUCATION. This entity consists of course number, date completed, course grade, etc., with course number as the key attribute. A MEMBER must have an EDUCATION HISTORY, which contains present education level, high school graduation date, college information, etc. A MEMBER may attend many COURSES. A COURSE will be either a NAVY SCHOOL, a TRAINING COURSE, or OTHER COURSE. A COURSE entity consists of the date course completed as the key attribute, and the code of the member who updated the entity. The attributes for a NAVY SCHOOL include Navy school title, which is the key attribute, earned Navy Enlisted Code (NEC), Navy school final mark, etc. The attributes specific to a TRAINING COURSE are training course NAVPERS number, which is the

key attribute, and course description. The attributes for OTHER COURSE include course name, location, duration, etc., with course name as the key attribute.

An ENLISTED may earn many ENLISTED CLASSIFICATION CODEs, which consist of the following attributes: classification type, code, and classification date, which is the key attribute. An ENLISTED may complete many PERSONNEL ADVANCEMENT REQUIREMENTS (PARs). This entity consists of PAR description, which is the key attribute, and date completed. An ENLISTED is given an ASVAB EXAM upon service entry. An ASVAB EXAM entity includes exam date taken, administering activity and the scores for each area. An ENLISTED may take many ADVANCEMENT EXAMs. This entity consists of exam date, which is the key attribute, exam rate, exam serial number, etc. An ENLISTED may complete many SPECIAL STUDYs, which contain information about the special studies area and the level of education in each area (high school years, college credits). The SPECIAL STUDY entity is uniquely identified by the study area name. An ENLISTED may achieve many ADVANCEMENTS during his career. The ADVANCEMENT entity contains attributes such as advancement date, which is the key attribute, rate advanced, time in rate information, etc. An ENLISTED may perform many PERFORMANCE TESTs, which measure his skill in a designated area. PERFORMANCE TEST information consists of performance test date, which is the key attribute, description and score. Many MILITARY LEADERSHIP EXAMs are administered to an ENLISTED. An instance of a MILITARY LEADERSHIP EXAM includes

military leadership exam date, which is the key attribute, score, paygrade, place, etc.

H. MASTER AT ARMS (MAA)

The MAA function keeps evidence for safekeeping and runs the urinalysis program. The MAA entity relationship diagram is located in APPENDIX H. The MAA may hold many EVIDENCE ITEMS and each EVIDENCE ITEM which must have one or more CUSTODIANS and may belong to a MEMBER. An EVIDENCE ITEM entity contains source name, date received, evidence item description, etc., and is identified by the evidence item number. A CUSTODIAN instance contains custodian from date and custodian name, as the key identifier, and other attributes such as custodian title, grade and activity. A MEMBER may be a CUSTODIAN. The MAA may conduct many URINALYSIS TESTs, each of which must be conducted on a MEMBER. At least one CUSTODIAN must keep the URINALYSIS TEST. An instance of a URINALYSIS TEST contains batch number, specimen number, date taken, results, witness name, etc. This entity is uniquely identified by batch number, specimen number and date taken. The MAA may be a MEMBER.

I. LEGAL

The LEGAL administrative function deals with legal matters specific to a MEMBER and to the command in general. The LEGAL entity relationship diagram is located in APPENDIX I.

Many SEARCH CONSENTs may be signed by a MEMBER. A SEARCH CONSENT consists of search date, location to be searched, person conducting search, etc. This entity is identified by the search date and location. Many LEGAL LETTERs may be given to a MEMBER,

which consist of the letter date, which identifies an instance of a LEGAL LETTER, letter type, commanding officer name, remarks, etc. A MEMBER may be involved in many civilian ARRESTs. This entity is identified by arrest date, and includes attributes such as arrest reason, arresting officer, etc. A MEMBER may be taken to one or more COURT MARTIALs throughout his career. The attributes contained in a COURT MARTIAL entity include court martial date, which is the key attribute, charges, convening authority name, judgement, etc. A MEMBER may have one or more RECORDs OF UNAUTHORIZED ABSENCE (UA). An instance of this entity is identified by the UA starting date and time, and includes dates and times of the unauthorized absence, apprehension information, etc. A MEMBER may have many NAVAL INVESTIGATIVE SERVICE (NIS) INVESTIGATIONs. The information kept in this entity includes investigation date, subject, type of action taken, etc., with the investigation date as the key attribute. A MEMBER may be given one or more ADMINISTRATIVE DISCHARGE BOARDs (if he is not discharged from a previous one). An instance of an ADMIN DISCHARGE BOARD will consist of the board date, board members, board recommendations, etc., with the board date as the key attribute. A MEMBER may be granted an ADMINISTRATIVE SEPARATION. This entity contains the separation date, separation type, separation reason, etc. A MEMBER may obtain many LEGAL ENCOUNTERs throughout his career. An instance of a LEGAL ENCOUNTER is identified by encounter date, and includes encounter type, place, and description. One or more CAPTAINS MASTs may be held on a MEMBER, which will consist of the mast date, which is the key

attribute, the offense date, UCMJ article violation, etc. A MEMBER may be assigned as the LEGAL Officer.

LEGAL may track many PRIVACY ACT REQUESTs. The information kept in this entity includes the request sequence number, which is the key attribute, request type, request granted indicator, date last updated, etc., to track the requests and their results. LEGAL may control many FREEDOM OF INFORMATION ACT (FOIA) RELEASEs. An instance of this entity is identified by the request date, and includes release request granted indicator, release request denied indicator, etc. LEGAL may generate many SEARCH AUTHORIZATIONS, which include attributes such as search request date, which is the key attribute, accused name, suspected offense, search place, etc., which must be authorized by the Commanding Officer. LEGAL may respond to many CONGRESSIONAL INQUIRYs. An instance of this entity is identified by the inquiry date and includes complaint nature, response, response date, etc.

A consolidated Data Dictionary for all of the Entity Relationship Diagrams discussed in this chapter is located in Appendix J. A dictionary of abbreviations and acronyms used in the diagrams is contained in Appendix K. The next chapter integrates the entity relationship diagrams developed in this chapter into a global schema, and creates higher levels of abstraction by using the entity clustering technique.

V. INTEGRATION AND ENTITY CLUSTERING

A. VIEW INTEGRATION

This chapter demonstrates the concept of integration of different user views into a single, nonredundant, global schema. The previously described entity relationship diagrams of the administrative functions represent the different user views. The view integration discussion is derived from Elmasri and Navathe [Ref. 3].

The different schemas must be compared with each other before integration occurs. Then, any detected conflicts must be resolved. There are two primary types of conflicts which can occur: naming and structural. Naming conflicts include *homonyms* and *synonyms*. *Homonyms* occur when the same name is given to two or more different entities. These can be detected by scanning the different entity relationship diagrams and looking for common names. If the different diagrams were developed with the same CASE tool, as was the case in this thesis, a central data dictionary will not allow this to occur. *Synonyms* can occur when different names are given to the same entity. These can be discovered by scanning the data dictionary for similar names and comparing them.

Structural conflicts will occur in the schema structure itself. *Type conflicts* occur when different Entity Relationship constructs are used to describe the same concept. For example, an instance of a lecture attended could be represented as an entity in one diagram and as a relationship in another. *Dependency conflicts* occur when different users specify a different connectivity between two

entities representing the same concept. For example, one user may describe the relationship as a one-to-many and another user may describe the same relationship in a different view as a many-to-many. Key conflicts result when different key attributes are assigned to the same entity in different views. For example, one user may say the key attribute of a Dependent is the dependent's social security number, and another user may designate the dependent's first and middle name as the key attribute.

In this study, the above mentioned conflicts are less likely to occur because there was only one designer involved in the process. However, the different views must be compared and checked for conflicts, because the designer may see the same relationship or entity in another perspective when designing the different views.

After the conflicts are detected, they must be resolved. This step requires user and designer interaction. The main goal is to conform the schemas so they can be integrated. This includes changing entity names, resolving relationship constraints and connectivity, changing key attributes on some entities, etc.

The final step in view integration consists of the actual merging and restructuring of the schemas. The entities that occur in several views, e.g., Member, are merged or superimposed in the integrated view. Other entities that do not overlap will stay intact with their relationships to the common entities. Any redundant relationships that occur from the merge can be dropped. In this step, the designer must make sure that the integrated view makes sense to the user, that all redundant entities and relation-

ships are removed, and that the global schema is complete. Once this global schema is developed, it can become extremely large and complex. One technique to better comprehend such a large picture is called entity clustering.

In this study, each of the administrative function entity relationship diagrams were examined and conformed for the integration. This process included resolving any conflicts detected in the diagrams. The different executive assistants for each function were renamed as "EXECUTIVE ASSISTANT." The common entities in each diagram were then merged into one entity for each type. These included MEMBER, EXECUTIVE ASSISTANT, OFFICER, ENLISTED, and DEPARTMENT. The rest of the entities did not overlap, so they appear intact in the global, merged schema. This integrated view is contained in Appendix L. The clustering technique was then applied to the global schema. This technique is discussed in the following section.

B. CLUSTERING CONCEPTS

Layered levels of abstraction can be achieved using entity clustering to create a higher level view, with fewer details, of the integrated global schema. This helps the user and the database designer better understand and manage a potentially large and complex database.

The entity clustering technique can be thought of as a *grouping* operation which combines entities and their relationships to create a higher level of abstraction. Multiple levels of abstraction can be formed by grouping entities into clusters and clusters into

higher level entity clusters. The four most common grouping operations are: dominance grouping, abstraction grouping, constraint grouping, and relationship grouping. [Ref. 5]

1. Dominance Grouping

In this operation, each dominant entity is grouped with all of its related nondominant entities to form an entity cluster. Weak entities and entities that are dependent on another entity can be absorbed into their related entity to form a cluster.

2. Abstraction Grouping

In this operation, multilevel objects, for example, generalization/specialization or aggregation, are combined to form an entity cluster. The supertype or aggregate entity name is used to name the entity cluster.

3. Constraint Grouping

In this operation, constraint related objects that extend the Entity Relationship Model, for example, two or more entities related to an entity but constrained by an exclusive OR relationship, are combined into an entity cluster. The entity cluster is named with the name of the dominant or parent entity.

4. Relationship Grouping

In this operation, relationships with a degree of three or more are grouped into an entity cluster. The entity cluster name is the name of the relationship.

In developing the high level schema, any or all of these techniques can be used. The designer must choose the operations which best suit the character of the database.

It is very important to validate the cluster diagram after the grouping is complete. The consistency of the relationships between entities must be checked at each level of the diagram. The meaning of each level must also be verified by the end-users.

By creating multiple levels of abstraction with the entity clustering technique, a simplicity of the diagram is created for end-user comprehension, as well as the complexity required for the database designer.

In this thesis, the abstraction and dominance grouping techniques were used. The resulting entity cluster diagrams are illustrated in Appendix M. In the PERSONNEL function, first the dominance grouping was performed: the weak entities and non-dominant entities related to MEMBER were combined to form the MEMBER entity cluster; the weak entities related to OFFICER were combined with OFFICER; the weak entities related to ENLISTED were combined to form an ENLISTED entity cluster; and the non-dominant entity related to DEPENDENT was combined with DEPENDENT to form an entity cluster. Then the abstraction grouping was performed on the ISA relationship (MEMBER ISA OFFICER or ENLISTED) and dominance grouping was applied to DEPENDENT to form a MEMBER-PERSONNEL entity cluster.

In the TRAINING function, dominance grouping was applied to the non-dominant and weak entities related to DEPARTMENT, (TRAINING) EXECUTIVE ASSISTANT and MEMBER to form the entity clusters DEPARTMENT, EXECUTIVE ASSISTANT and MEMBER-TRAINING, respectively.

In the SHIP SECRETARY function, dominance grouping was applied to the non-dominant entities related to MEMBER, DEPARTMENT and EXECUTIVE ASSISTANT to form the respective entity clusters.

Dominance grouping and abstraction grouping were applied to the WELFARE AND RECREATION function. TICKET was grouped with TICKET BLOCK to form an entity cluster; and the ISA relationship between EQUIPMENT and ISSUABLE and FIXED was combined into the entity cluster WELREC EQUIPMENT. Then, these two entity clusters were grouped into the WELFARE AND RECREATION cluster, which was the more dominant entity.

In the COMMAND CAREER COUNSELOR function, dominance grouping was performed on the weak entities related to ENLISTED to form an ENLISTED-CAREER entity cluster. Then, abstraction grouping was applied to ENLISTED-CAREER with the ISA relationship to MEMBER to form a MEMBER-CAREER cluster.

Dominance grouping and abstraction grouping were applied to the PUBLIC AFFAIRS OFFICER function. COMMAND CO/XO was combined with OFFICER to form the OFFICER entity cluster; PRESS RELEASE and COMMAND HISTORY ITEM were combined with EXECUTIVE ASSISTANT to form the EXECUTIVE ASSISTANT cluster; and HOMETOWN INFO was combined with MEMBER to form the MEMBER cluster. Then, the OFFICER cluster was combined with its ISA relationship entity of MEMBER to form the MEMBER-PAO cluster.

The EDUCATIONAL SERVICES OFFICER function required both dominance and abstraction grouping. The COURSE specialization relationship was combined to form a COURSE entity cluster; the weak

entities related to ENLISTED were combined to form the ENLISTED cluster; and the weak entities related to MEMBER were combined to form the MEMBER cluster. Then, the MEMBER specialization relationship was combined with ENLISTED and the COURSE cluster was combined with MEMBER to form a MEMBER-EDUCATION entity cluster.

In the MASTER AT ARMS function, the weak and non-dominant entities were grouped with MEMBER to form a MEMBER-MAA cluster, using the dominance grouping technique.

In the LEGAL function, the dominance grouping technique was used to combine the weak entities related to MEMBER to form the MEMBER-LEGAL cluster and to combine the non-dominant entities related to the EXECUTIVE ASSISTANT into the EXECUTIVE ASSISTANT cluster.

These functional clusters were applied to the global picture and the MEMBER clusters were combined to form a single MEMBER cluster called MEMBER-ADMIN. The resulting high level diagram contains the DEPARTMENT, MEMBER-ADMIN and EXECUTIVE ASSISTANT as the entity clusters.

This high level abstraction is very simple with few details; it is used to give the user a broad view of the system. The remaining clusters show the important areas of focus in the system. The designer will use the lower level diagrams with the details to develop a database.

In the next chapter, the conclusions and recommendations resulting from this study are discussed.

VI. CONCLUSIONS AND RECOMMENDATIONS

A. CONCLUSIONS

The goal of this thesis was to examine the administrative functions of a generic naval ship and explore the possibility of developing a high level conceptual data model. This study successfully completed this goal with opportunities to further the research in the area of standardized schema for the Navy and DoD.

This thesis follows the data modeling approach, which focuses on capturing the data requirements as the basis of developing computer based applications. This is contrary to other methodologies of system design which concentrate on specifying functional or process requirements. The process requirements of an organization constantly change as the organizational environment changes. The data requirements of an organization, however, tend to be more stable over the life of a given system.

Our approach places emphasis on specifying data rather than process requirements, which is similar to the CIM initiative concepts, thus providing a good foundation for standardization of information. The CIM initiative efforts, however, have been directed toward the standardization of data elements, the lowest element in the data hierarchy, as the foundation for standardizing information systems at DoD. Our efforts extend beyond that of the CIM initiative, by specifying a common conceptual data model for Navy ships. This conceptual data model can be easily transformed into a standardized model specific schema. This approach is particularly appealing within a Navy environment. By their nature,

Navy organizations are generally structured in the same manner. This commonality lends itself to the development of a standardized schema. This standardized schema can then be tailored to fit the structure of a specific organization.

A "master" database can be developed from the standardized schema, from which a specific database for an individual ship can be generated. For example, a newly commissioned ship can download its command database from the previously established master database. This process will significantly reduce the required man-hours in building a command database. Subsequent updates to the command database can be accomplished electronically from the master database. This ensures the integrity, accuracy and security of the data. Additionally, the required amount of paperwork, storage space and database maintenance will be significantly minimized.

Schema standardization also allows the development of applications that are fully compatible between shore and afloat units. The advantage of establishing standardization at the schema level can be realized when data transfers between units ashore and afloat can be accomplished without protocol or format conversions. To illustrate this concept, imagine a ship's personnel office updating the Enlisted Data Verification Record (EDVR) via direct on-line access to the master personnel database in Washington, D.C., which maintains manning information for all Navy units/activities. Queries, updates and verifications could be accomplished in a matter of minutes instead of the several days which are currently required to accommodate mailing paper documents.

The standardized schema will also facilitate interoperability between ships and their administrative and operational chains of command. Ships could electronically transfer operational, material, and personnel information, schedules, and other information to their squadron, group and type commander. This information can be consolidated with the other information and used for monitoring ship readiness status for inspections and administrative and operational tasking. Data exchange can be accomplished via telecommunication circuits which are not physically or geographically limited (e.g., telephone land line, satellite communications, etc.), thus providing real-time information regardless of location.

If applied to other functional areas within and across services, our approach could benefit efforts to accomplish data exchange between organizations. More importantly, however, is the potential for significantly improving data exchanges among different branches within the DoD. Joint interoperability has become a paramount objective of the Joint Chiefs of Staff (JCS), the importance of which has been clearly demonstrated by recent events in the Middle East.

This study has followed the standards established by the CIM initiative with the following exception: The naming conventions set by CIM, which do not allow any abbreviations or acronyms, create unreasonably long data element names. This severely limits the number of available CASE tools for system design. Most tools only allow a data element name with a maximum of 32 characters. In many instances, following the CIM naming conventions required data

element name lengths in excess of 60 characters. Incorporation of a standardized list of common abbreviations and acronyms into the CIM data dictionary for use with data modeling and system design would facilitate greater use of CASE tools in designing new systems in accordance with the CIM initiative. It is not unreasonable to expect standard acronyms and abbreviations to be understood by users. Standardized lists such as the Dictionary of Naval Abbreviations are readily accessible to users for clarification of an unrecognized term. The use of approved acronyms and abbreviations in data element naming would reduce data element names to a length which is acceptable to most CASE tools.

Several CASE tools were evaluated before choosing Chen and Associates ER-DESIGNER for use in this study. This CASE tool was the closest to meeting our requirements for diagramming features, report generation, automated and centralized data dictionary, and ease of use. Additionally, Chen and Associates provide other tools which interact with this tool for further development of this project. It also supports interaction with the upcoming IBM Repository. Use of such a tool will allow greater interoperability with the CASE tools currently being used by the DoD.

One of the problems encountered in using ER-DESIGNER software was the inability to properly show the mandatory or optional relationships between entities. In order to show this feature, we had to use the software feature of showing the upper and lower bounds in a relationship. (Their zero was our optional "O," and their one was our mandatory line.) This procedure restricts the use

of the report generator function of the tool, because the detailed reports on relationships are inaccurate.

B. RECOMMENDATIONS

We recommend that DoD either design or purchase a central repository package which will accept and store data from many other tools in a standardized data dictionary. A good example of this concept is the AD Cycle package offered by IBM. By following this approach, DoD could utilize existing CASE tools and acquire other tools as needed without considering if they are fully integrated over the entire life cycle or if they interact with other tools. Even if a tool has its own central repository and is integrated over the entire life cycle, like Texas Instrument's IEF package, it cannot interact with other tools. Emphasis should be placed on the central repository package, which can alleviate concerns about integration or interoperability between the different CASE tools. This will facilitate the CIM initiative's goals of standardization from a point much earlier in a project's life cycle. It will also allow users to use the tools of their choice without having to throw away tools that have already been purchased and forcing them to use one "standardized" tool. DoD is currently designing a "standardized" CASE tool for everyone to use. If this occurs, millions of dollars may be lost in converting all of the information from systems currently being developed by other CASE tools into this new tool. In addition, the large dollar investment in CASE tools already in use may be lost due to incompatibility. The idea of a single standardized CASE tool to meet every user's needs

would require such a high level of complexity that it would necessitate a substantial investment of dollars and development resources.

C. FUTURE RESEARCH EFFORTS

Future efforts should be made to take the data model developed in this study and complete the database design. This includes developing a model specific schema (i.e., relational, hierarchical or network) and the physical design of a DBMS specific model as discussed in Chapter III. Such efforts should continue to comply with the standards of information established by the CIM initiative.

Additionally, we feel that the concepts discussed in this thesis are applicable to several other functional areas, both administrative and operational, within the Navy and other services of the DoD. As the size of our military forces is reduced and budget constraints become more demanding, increased levels of interoperability among our services will be required. We perceive a need to develop high level conceptual data models for other functions within the Navy, as well as other services, to improve interoperability and minimize redundancy among the different branches of DoD. Development and standardization of conceptual data models will facilitate development of systems for improved data exchange between the services and subsequent improvements in how they will operate in the joint forces of the future.

ATTRIBUTE REPORT FOR CCC - VERSION 2.11

Attribute Name	Alias	Format	Key	Object & Type
CAREER_INTENSIONS_CODE	CAREER INTE	C,1	N	TRANSFER W
SC: Code indicating member's career intentions				

Long Comment :

The following are valid codes for career intentions:

R = Reenlist at EAOS
P = Extend onboard at present duty station
E = Extension at EAOS
U = Uncertain
D = Discharge at EAOS
F = Fleet Reserve or Retirement

CCC_INTERVIEW_CAREER_INTENTIONS	CCC CAREER	C,50	N	CCC INTE W
SC: Career intentions of member as indicated in interview				

CCC_INTERVIEW_COMMENTS	CCC COMENTS	C,100	N	CCC INTE W
SC: Comments about member from interview by the CCC				

CCC_INTERVIEW_DATE	CCC INTERVI	D	Y	CCC INTE W
SC: Date of CCC interview				

CCC_INTERVIEW_LAST_UPDATED_BY	CCC INTERVI	C,3	N	CCC INTE W
SC: Identification code of person who last updated this record				

CCC_INTERVIEW_LAST_UPDATED_DATE	CCC INTERVI	D	N	CCC INTE W
SC: Date this interview record was last updated				

CCC_INTERVIEW_TYPE	INTERVIEW T	C,15	Y	CCC INTE W
SC: Type of the interview (reenlistment, annual, special, reporting, etc)				

DEPARTMENT/DIVISION_ASSIGNED	DEPT DIV AS	C,30	N	ENLISTED E
SC: Names of department and division to which member is assigned				

DUTY/ACTIVITY_CODE_FIRST_CHOICE	DUTY ACT CO	C,4	N	DUTY PRE W
SC: Activity code for member's first choice of duty or activity type				

DUTY/ACTIVITY_CODE_SECOND_CHOICE	DUTY ACT CO	C,4	N	DUTY PRE W
SC: Four character code for member's second choice of duty or activity				

DUTY/ACTIVITY_CODE_THIRD_CHOICE	DUTY ACT CO	C,4	N	DUTY PRE W
SC: Four character code for member's third choice of duty or activity type				

DUTY/ACTIVITY_TYPE_FIRST_CHOICE	DUTY ACT TY	C,20	N	DUTY PRE W
SC: Member's first choice of type of duty or activity for this duty type				

9/15/1991
2:34 PM

ATTRIBUTE REPORT
Author: Teresa Briede

page: 2

DUTY/ACTIVITY_TYPE_SECOND_CHOICE DUTY ACT TY C,4 N DUTY PRE W
SC: Member's second choice of duty or activity type for this duty type

DUTY/ACTIVITY_TYPE_THIRD_CHOICE DUTY ACT TY C,20 N DUTY PRE W
SC: Member's third choice of type of duty or activity for this duty type

DUTY_DATE_SUBMITTED DUTY DATE S D Y DUTY PRE W
SC: Date member submitted duty preference

DUTY_LOCATION_CODE_FIRST_CHOICE DUTY LOC CO C,3 N DUTY PRE W
SC: Three character code for location code (member's first choice)

DUTY_LOCATION_CODE_SECOND_CHOICE DUTY LOC CO C,3 N DUTY PRE W
SC: Three character code of member's second choice for duty location

DUTY_LOCATION_CODE_THIRD_CHOICE DUTY LOC CO C,3 N DUTY PRE W
SC: Three character code for member's third choice of location of duty

DUTY_LOCATION_FIRST_CHOICE DUTY LOC FI C,20 N DUTY PRE W
SC: Member's first choice of a duty station location for this duty type

DUTY_LOCATION_SECOND_CHOICE DUTY LOC SE C,20 N DUTY PRE W
SC: Member's second choice of duty location for this duty type

DUTY_LOCATION_THIRD_CHOICE DUTY LOC TH C,20 N DUTY PRE W
SC: Member's third choice for location of duty in this duty type

DUTY_PREFERENCE_LAST_UPDATE_DATE DUTY PREF L D N DUTY PRE W
SC: Indicates when this duty preference record was last updated

DUTY_TYPE DUTY TYPE C,8 Y DUTY PRE W
SC: Type of duty (shore, overseas, or sea) preference req'd for each type

DUTY_TYPE_PRIORITY DUTY TYPE P C,1 N DUTY PRE W
SC: Prioritizes the duty types (1,2,3) as to which the member wants most

ENLISTED_RATE ENLISTED RA C,5 N ENLISTED E
SC: Rate of enlisted member

ENLISTED_RATING ENLISTED RA C,25 N ENLISTED E
SC: Rating of enlisted member

EXTENSION_INTENT_NUMBER_MONTHS EXT INTENT N,2 N TRANSFER W
SC: Number of months the member intends to extend

HOUSEHOLD_EFFECTS_PRESENT_WEIGHT HOUSEHOLD E N,2 N TRANSFER W
SC: Member's household effects weight (K pounds) at present duty station

HOUSEHOLD_EFFECTS_STORAGE_LOC HOUSEHOLD E C,3 N TRANSFER W
SC: Location code of member's household effects in storage

HOUSEHOLD_EFFECTS_STORAGE_WEIGHT HOUSEHOLD E N,2 N TRANSFER W

9/15/1991
2:34 PM

ATTRIBUTE REPORT
Author: Teresa Briede

page: 3

SC: Weight of household effects in storage (in thousands of pounds)

LAST DEPLOYMENT LENGTH LAST DEPLOY N,2 N TRANSFER W
SC: Number of months the member's last deployment was

LAST DEPLOYMENT LOCATION CODE LAST DEPLOY C,4 N TRANSFER W
SC: Location code for member's last deployment

Long Comment :

The following codes are valid for last deployment location code

7FLT = 7th fleet
MED = Mediterranean
CARB = Caribbean
NEUR = North Europe
MEST = Mid-East
INDO = Indian Ocean
SOAM = South America
ANT = Antarctic

LAST DEPLOYMENT RETURN DATE LAST DEPLOY D N TRANSFER W
SC: Date member returned from last deployment

LOCATION TYPE PRIORITY LOC TYPE PR C,1 N DUTY PRE W
SC: Indicates which is more important to the member (L=location, T=type)

MEMBER NAME MEMBER NAME C,45 N ENLISTED E
SC: Full name of member

MEMBER SOCIAL SECURITY NUMBER SSN C,11 Y ENLISTED E
SC: Social security number of member

NEED TO BE SINGLE SINGLE L N RETENTIO W
SC: Indicates if the retention program requires the member to be single

PDB APPROVAL PDB APPROVA L N PDB W
SC: Indicates if Performance Development Board approved member's request

PDB COMMENTS PDB COMMENT C,100 N PDB W
SC: Comments from the Performance Development Board about member's request

PDB DATE PDB DATE D Y PDB W
SC: Date member attended Performance Development Board

PDB REASON PDB REASON C,25 N PDB W
SC: Reason member attended the Performance Development Board

REENLIST INTENT NUMBER MONTHS REENLIST IN N,2 N TRANSFER W
SC: Number of months the member intends to reenlist for

RETENTION PROGRAM DESCRIPTION RET PGM DES C,100 N RETENTIO W
