15. ABSTRACT (Maximum 200 words)

Novel, general methods for the preparation of thermally stable perfluorinated organometallic reagents were developed. F-vinyl iodides were prepared as precursors to F-vinyl organometallics. A variety of polyfluorinated cadmium, zinc, and copper reagents were developed as synthetic reagents for the introduction of polyfluorinated alkyl, aryl, and allyl groups. SET chemistry was developed for the regiospecific addition of iodofluoroacetates and iodofluoromethylphosphonates to functionalized alkenes, and to accomplish a useful preparation of allylsulfonyldifluoroacetates and acetamides. Alkylation reactions and acylation reactions of α -fluorocarboxy phosphorus ylides were developed as a useful entry to precursors which could be easily hydrolyzed to α -fluoro ester and α -fluoro- β -keto esters.

9. ABSTRACT OF OBJECTIVES AND ACCOMPLISHMENTS:

The objectives of this project were: (a) to develop new, novel, stereospecific general methods for the preparation of thermally stable polyfluorinated organometallic reagents. An adjunct of this strategy was to elucidate the structure of these reagents and to develop their application particularly for the synthesis of functionalized fluorocarbon derivatives; (b) to utilize commercially available precursors (where applicable) as the source of fluorine in reactive intermediates in order to facilitate utilization of the synthetic methodology by other workers and to assist scale up of the preparative procedures; (c) to develop single electron transfer (SET) methodology as a useful, easily scaled-up synthesis of functionalized fluorine-containing compounds; (d) to utilize fluorine-containing ylides as synthetic intermediates in the synthesis of α -fluoro- α,β -unsaturated esters; and (e) to develop Pd(0) catalyzed processes for the preparation of perfluoro vinyl or polyfluoroaryl functionalized derivatives.

Initial efforts were directed to the stereospecific preparation of *E*-vinyl iodides as precursors to *E*-vinyl organometallics. A successful approach to *E*-1-iodopentafluoropropene was developed from hexafluoropropene (HFP) *via* reaction of HFP with tertiary phosphines to give the *Z*-perfluoropropenyl phosphorane. Subsequent hydrolysis of the vinyl phosphorane gave *E*-1,2,3,3,3-Pentafluoropropene. Treatment of this *E*-1-hydro-*E*-propene with SbF₅ gave *Z*-1,2,3,3,3-Pentafluoropropene. Subsequent metallation of the *Z*-1-hydro-*E*-propene (with *n*-BuLi) and iodination of the organic lithium intermediate gave pure *E*-1-Iodopentafluoropropene. Trifluorovinyl iodide and both *E*- and *Z*-1-iodopentafluoropropenes are stereospecifically converted to the corresponding *E*-vinyl zinc reagents. These *E*-vinyl iodides readily participate in Pd(0) catalyzed reactions; with terminal alkynes, we have developed a general stereospecific route to fluorinated enynes. Similarly, fluorinated aryl iodides undergo Pd(0) catalyzed coupling reactions with 1-alkynes and this methodology provides a high yield, easily scaled-up entry to polyfluorinated aryl alkynes and di-yne.

A variety of polyfluorinated cadmium, zinc and copper reagents have been developed as synthetic reagents for the introduction of polyfluorinated alkyl, allyl and aryl groups. Perfluoroisopropylcadmium and copper were prepared and the stability and reactivity of these secondary perfluoroallyl organometallics was investigated. A new, novel generation of trifluoromethylcopper was developed based on the cheap

precursor, chlorodifluoroacetate. It was also unequivocally demonstrated that trifluoromethylcopper(I) could be cleanly oxidized to a stable trifluoromethylcopper(III) and the first example of a perfluoroalkylcopper(III) complex was prepared and its structure demonstrated by x-ray crystallography. The first preparation of perfluoroallyl cadmium and copper reagents was developed and applications of these novel E-allylic organometallics were demonstrated. Similarly, the facile preparation of E-phenyl Mono- or Bis-cadmium and copper reagents was developed from the commercially available bromo- or iodopentafluorobenzene and 1,2-dibromotetrafluorobenzene, and the application of these novel reagents for the synthesis of functionalized E-aryl derivatives was demonstrated. The first practical preparation of perfluoroalkyl allenes and difluoromethyl allenes was developed from the reaction of perfluoroalkyl copper and difluoromethyl copper reagents with propargyl chlorides and tosylates. In contrast to previous reports, this methodology provided a safe and facile route to these perfluorinated building blocks. The functionalized organometallic, $(RO)_2P(O)CF_2ZnBr$, was developed as a useful stable organometallic reagent and could be utilized in the first, high yield practical synthesis of the novel fluorinated chelating agent, $(RO)_2P(O)CF=CFP(O)(OR)_2$ (where R = H, Et). This reagent was also utilized in regiospecific allylation reactions and provided a useful synthetic route to 1,1-difluoro-3-alkenephosphonates. The trifluorovinyl copper reagent was utilized for the development of diene precursors which could be reacted with sulfur trioxide (sulfonation) to give novel fluorinated β -sultones. Ring opening of these sultones gave novel fluorinated sulphonyl fluorides useful in polymerization studies. The commercially available olefin, 3-bromo-3,3-difluoropropene, was utilized in the metal mediated regiospecific gem-difluoroallylation of aldehydes and ketones as an entry to α,α -difluorohomoallylic alcohols. The regiospecificity was correlated with theoretical studies of the 1,1-difluoroallylic anion.

SET chemistry was developed for the regiospecific addition of iododifluoroacetates and iododifluoromethylphosphonates to functionalized alkenes. Reduction of the adducts with a new Ni^0 catalyst provided a practical synthetic route to α,α -difluoro-functionalized esters and α,α -difluoro-functionalized phosphonates. The SET methodology avoided the use of expensive, toxic and hazardous reagents and provided the first practical, easily scaled-up, safe route to these important fluorinated precursors. Similar strategy was utilized to accomplish a useful preparation of allylsulphonyldifluoroacetates and acetamides. A combination of organometallic chemistry and SET chemistry was employed in the preparation of the mixed acid, $(HO)_2P(O)CF_2SO_3H$.

Alkylation and acylation reactions of α -fluorocarboalkoxy phosphorus ylides (phosphonium and phosphonate) were developed as a useful entry to precursors, which could be readily hydrolyzed (aqueous NaHCO_3) to α -fluoro ester and α -fluoro- β -keto esters. An adjunct of this strategy resulted in the development of a reduction olefination reaction of fluorinated esters. This methodology provided an efficient synthesis of α -fluoro- α,β -unsaturated esters *directly* from polyfluorinated esters. Thus, the necessity to prepare the easily hydrated and easily polymerized α,β -fluorinated aldehydes was avoided. This methodology was utilized to develop a practical, large scale synthesis of the monomer, ethyl-2-fluoroacrylate.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) Perfluoroisopropylcadmium can be prepared in excellent yield (98%) from (CF ₃) ₂ CFI and activated cadmium powder in DMF at room temperature under degassed conditions. The resultant cadmium reagent undergoes metathesis with copper(I) salts to give perfluoroisopropylcopper, in quantitative yield. While perfluoroisopropylcopper is stable in DMF at room temperature under nitrogen, the cadmium counterpart decomposes to a mixture of dimers and trimers of hexafluoropropene, under the same conditions. Sulfur dioxide can be inserted into the cadmium-carbon bond in perfluoroisopropylcadmium while no reaction was observed with the corresponding copper reagent. No stable F-alkylcadmium could be obtained from the reaction of CF ₃ CF ₂ CFICF with either Cd powder or Me ₂ Cd; only the elimination product, CF ₃ CF=CFCF ₃ , was observed. Perfluoroalkylation reactions with F-isopropylcadmium/copper in DMF met with limited success.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) The addition reaction of diethyl iododifluoromethylphosphonate to alkenes catalyzed by palladium in the absence of solvent gives the corresponding adducts in good yields at room temperature. A variety of functional groups in the alkenes, including alkyl, trimethylsilyl, hydroxy, epoxy, ketone and ester, are tolerated under the reaction conditions. The reduction of the adducts with nickel chloride and zinc in moist THF provides the title compounds.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) Esters with one or two fluorines at the α -carbon are useful building blocks for construction of interesting and novel biologically active substrates. Alkylation of α -fluorocarboethoxy phosphonium ylides followed by hydrolysis of the resultant phosphonium salt with 5% aqueous sodium bicarbonate provides a useful preparative route to α -fluoroesters. Similarly, acylation/hydrolysis of either α -fluoro phosphonium ylides or α -fluorophosphonate anions gives a general route to 2-fluoro-3-oxo-esters. The α,α -difluoroesters can be prepared by Cu^0 catalyzed addition of iododifluoroacetates to olefins followed by reduction of the iodo addition adduct. Both terminal and internal olefins participate equally well in the addition reaction.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) In the presence of zinc, 3-bromo-3,3-difluoropropene or 3-iodo-1,1-difluoropropene reacted with carbonyl compounds to give the corresponding α,α -difluorohomoallylic alcohols in good yields at 0°C to room temperature. The reaction is applicable to aliphatic and aromatic aldehydes, dialkyl ketones, and alkyl aryl ketones. Reaction with α,β -unsaturated aldehydes and ketones yielded 1,2-adducts exclusively. However, the reaction could not be extended to esters and acyl chlorides. Other metals such as cadmium and tin could also be used to mediate gem-difluoroallylation. The regiochemistry of this reaction could be rationalized in terms of the more nucleophilic α -carbon of the gem-difluoroallyl intermediate.

FIELD	GROUP	SUB-GROUP	Fluorinated Ylids; Fluorinated esters; acylation		
19. ABSTRACT (Continue on reverse if necessary and identify by block number) (Fluorocarboethoxymethylene)tri-n-butylphosphorane (3) reacts with acid chlorides and anhydrides to form the corresponding carbon acylated phosphonium salts 4, and hydrolysis of 4 under mild basic conditions provides RCOCFHCOOEt (8) in moderate yields. The reaction is applicable to primary, secondary, tertiary, cyclic, aromatic, and ester-substituted acid chlorides. Acylation with ethyl chloroformate and ethyl chlorothioformate leads to the diesters CFH(COOEt)_2 and EtSCOCFHCOOEt . Extension of this reaction sequence to perfluorinated and partially fluorinated acid chlorides did not proceed cleanly to give the expected phosphonium salts. However, the anion derived from $(\text{EtO})_2\text{P(O)CFHC(O)OEt}$ reacts with R_fCOCl to form the corresponding C-acylated phosphonates 10, and hydrolysis of 10 gives $\text{R}_f\text{COCFHCOOEt}$.

FIELD	GROUP	SUB-GROUP	fluorinated enynes; fluorinated vinyl iodides; fluorine-containing acetylenes; palladium catalysis		
19. ABSTRACT (Continue on reverse if necessary and identify by block number) In the presence of cuprous iodide, the palladium-catalyzed coupling reaction of fluorinated vinyl iodides with terminal alkyl and phenyl substituted alkynes gives the corresponding enynes in good yields under mild conditions. The reaction works well with perfluorovinyl, phenyl and phosphoryl substituted iodides, and the stereochemistry in the vinyl iodide was preserved in the enyne products. With a terminal dialkyne the dienyne is formed when two equivalents of the vinyl iodide are used as substrate. However, upon reaction of Z-iodopentafluoropropene with alkynes containing electron-withdrawing groups such as ethoxycarbonyl or perfluoroalkyl, no desired enynes were observed under similar reaction conditions. The coupling reaction can be carried out in a variety of solvents, including DMF, DMSO, HMPA, acetonitrile, dioxane, chloroform, benzene and hexane as well as in excess triethylamine as solvent.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) Tetrafluorodibromobenzenes react readily with acid-washed cadmium in DMF at temperatures ranging from 25° C to 60° C to give bromotetrafluorophenylcadmium reagents in excellent yields. Treatment of the mono- cadmium reagent solution with excess cadmium at 100°C affords the tetrafluorophenylbiscadmium reagents. The mono- and bis-copper reagents are obtained via metathesis of the corresponding cadmium reagents with cuprous bromide at room temperature. Allylation and acylation of the biscopper reagents give the corresponding allylated and acylated tetrafluorobenzenes, respectively.

19. ABSTRACT (Continue on reverse if necessary and identify by block number)					
In the presence of cuprous iodide, the palladium catalyzed coupling reaction of substituted tetrafluorophenyl halides with 1-alkynes gives the corresponding fluoroaryl alkynes in good to excellent yields under mild conditions. Both 4-substituted (methoxy, N,N-dimethylamino, morpholino) tetrafluorophenyl iodides and bromides work well, and alkyl, trimethylsilyl, phenyl, hydroxy, and ether functionalities in the alkyne moiety are tolerated under the reaction conditions. This methodology provides a practical synthesis of substituted fluorinated aryl alkynes.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) Perfluoroallyl iodide reacts readily with acid-washed cadmium powder in DMF at 0° C to give the F-allylcadmium reagent. Metathesis of F-allylcadmium with Cu(I)Br at -35° C in DMF gives the F-allylcopper reagent. With zinc powder, perfluoroallyl iodide affords mainly F-1,5-hexadiene. Only a low yield of F-allylzinc was detected. Both F-allylcadmium and F-allylcopper react with allyl bromide to yield 1,1,2,3,3-pentafluoro-1,5-hexadiene.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) Cuprous halide mediated decomposition of (diethoxyphosphinyl)difluoromethylzinc bromide, $(EtO)_2P(O)CF_2ZnBr$, forms the title bisphosphonates in 50% isolated yield. The ^{19}F and ^{31}P NMR spectra of these isomeric bisphosphonates exhibit non-first order AA'XX' patterns. Computer simulation permitted the determination of the J_{p-f} , J_{f-f} , and J_{p-p} coupling constants for these compounds. Silylation and hydrolysis of the bisphosphonate mixture gave the silylated bisphosphonates and bisphosphonic acids respectively, as expected. Metathesis of the zinc reagent also yielded phenyl (diethoxyphosphinyl)difluoromethylmercury, $(EtO)_2P(O)CF_2HgPh$, in good yield. However, attempts to generate fluoro-(diethoxyphosphinyl)carbene from this mercurial were unsuccessful.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) A reduction-olefination sequence has been used to convert esters to α -fluoro α,β -unsaturated esters. In the presence of diisobutylaluminum hydride, esters are reduced to aldehydes that react in situ with $[(EtO)_2P(O)CFC(O)OEt]^-Li^+$ to form the title compounds in good yields with high stereoselectivity. The reaction is applicable to aliphatic, aromatic, cyclic, unsaturated, perfluorinated, and partially fluorinated esters. The E/Z ratio of unsaturated esters formed in the reaction varies with the cations present in the reaction mixture. Solvents have very little influence on stereochemistry. The sequential trans-formation of $PhC(O)OBu^t$ to (E)- $PhCH=CFC(O)OEt$ and then to (E,E)- $PhCH=CFCH=CFC(O)OEt$ illustrates the scope of this methodology, which introduces a fluorine atom adjacent to an ester functionality with concomitant elongation of the chain by two carbon atoms.

FIELD	GROUP	SUB-GROUP			
19. ABSTRACT (Continue on reverse if necessary and identify by block number) (Fluorocarbethoxymethyl)trialkylphosphonium bromides, prepared from ethyl bromofluoroacetate and tertiary phosphines, react with n-butyllithium in THF to give the corresponding phosphoranes. Reaction of the pregenerated (fluorocarbethoxymethylene)tri-n-butylphosphorane with primary alkyl iodides and activated alkyl bromides followed by in situ hydrolysis of the alkylated salts provides the fluoroalkanoates in a one-pot reaction. In the case of secondary alkyl halides, no substitution was observed, the main reaction being decomposition of the phosphorane. However, the anion obtained from diisopropyl (fluorocarbethoxymethyl)phosphonate reacts with $\text{CH}_3\text{CH}(\text{Ph})\text{Br}$ and $(\text{CH}_3)_2\text{CHI}$ to afford the corresponding alkylated phosphonates in good yields. Displacement of the phosphonate moiety either by base-induced hydrolysis or by reduction was unsuccessful.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) The addition of iododifluoroacetates to alkenes is catalyzed by copper powder (10-20 mol %) at 50° to 60°C. The reaction can be carried out neat or in hexane or benzene as solvent. Both terminal and internal alkenes gave good yields (65-83%). Reduction of the adduct with tributyltin hydride provides the α,α -difluoroacetate.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) From hexafluoropropene, large scale stereospecific syntheses have been developed for the preparation of <u>E</u> -CF ₃ CF=CFH, <u>Z</u> -CF ₃ CF=CFH and <u>E</u> -CF ₃ CF=CFI. This work provides the <u>1st</u> stereospecific preparation of 1-hydro and 1-iodo alkenes.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) (Sulfodifluoromethyl)phosphonic acid, $(\text{HO})_2\text{P}(\text{O})\text{CF}_2\text{SO}_3\text{H}$, has been synthesized for the first time. This mixed phosphonic-sulfonic acid was prepared from $(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{O})\text{CF}_2\text{SO}_3\text{Na}$, which had been synthesized via oxidation of the corresponding sulfinic salt, $(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{O})\text{CF}_2\text{SO}_2\text{Na}$. The sulfinic salt was prepared from $(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{O})\text{CF}_2\text{X}$ ($\text{X} = \text{Br}, \text{I}$) and $[(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{O})\text{CF}_2\text{SO}_2]_2\text{Cd}$ precursors.

FIELD	GROUP	SUB-GROUP	fluorinated organometallics; fluorinated phosphonates; fluorinated zinc reagents.		
19. ABSTRACT (Continue on reverse if necessary and identify by block number) The reaction of [(diethoxyphosphoryl)difluoromethyl]zinc bromide, $(EtO)_2P(O)CF_2ZnBr$, with allylic halides was found to be catalyzed by $CuBr$ and represents a synthetically viable and convenient route to the title phosphonates. However, the reaction could not be readily extended to allyl acetate. Propargyl chloride gave predominantly an allenic product, diethyl 1,1-difluoro-2,3-butadienephosphonate (4). The regiochemistry of the allylation reactions is controlled by steric factors such that the $(EtO)_2P(O)CF_2$ moiety is bound to the least sterically hindered allylic terminus. Evidence is presented for an S_N2 vs S_N2' type mechanistic interpretation, rather than the involvement of a symmetrical $(\pi$ -allyl) $Cu(III)$ intermediate and an oxidative addition/reduction elimination type mechanism.

19. ABSTRACT (Continue on reverse if necessary and identify by block number) The i.r. spectrum of gaseous tetrafluoropropyne has been measured from 4000 to 100 cm^{-1} , and all of the observed bands have been assigned. The C mode frequencies of the CF_3 group are similar to those of other CF_3CCX species, and even though the α_1 modes are less regular, the variations can be explained without changes in force constants other than those involving the C-X bond. Several bands, particularly ν_1 and combinations with ν_1 , show pronounced sequence structure due to excited levels of ν_{10} , the C-C-C skeletal bend.
