NOTICES

REPORT NUMBERING SYSTEM — The numbering of technical project reports issued by the Naval Air Development Center is arranged for specific identification purposes. Each number consists of the Center acronym, the calendar year in which the number was assigned, the sequence number of the report within the specific calendar year, and the official 2-digit correspondence code of the Command Officer or the Functional Department responsible for the report. For example: Report No. NADC-88020-60 indicates the twentieth Center report for the year 1988 and prepared by the Air Vehicle and Crew Systems Technology Department. The numerical codes are as follows:

CODE	OFFICE OR DEPARTMENT
00	Commander, Naval Air Development Center
01	Technical Director, Naval Air Development Center
05	Computer Department
10	AntiSubmarine Warfare Systems Department
20	Tactical Air Systems Department
30	Warfare Systems Analysis Department
40	Communication Navigation Technology Department
50	Mission Avionics Technology Department
60	Air Vehicle & Crew Systems Technology Department
70	Systems & Software Technology Department
80	Engineering Support Group
90	Test & Evaluation Group

PRODUCT ENDORSEMENT — The discussion or instructions concerning commercial products herein do not constitute an endorsement by the Government nor do they convey or imply the license or right to use such products.

SUMMARY

As part of a continuing NAVAIRDEVCON program to monitor the landing performance of naval carrier aircraft, the Aero Structures Division performed a carrier landing loads survey onboard the USS ENTERPRISE in September of 1985. This document formally presents the results of that survey, which were previously provided to NAVAIR informally.

The principle goal of this survey was to compare day and night carrier landing performance. Nearly 900 day and over 500 night landings of fleet aircraft were recorded and analyzed. This survey includes data on F-14, F-18, A-6E, A-7E, EA-6B, E-2C, S-3A and TA-3B aircraft. This survey also provided data on over 1000 carrier landings of student pilots performing day landings of T-2C and TA-4 aircraft. This survey was performed off the west coast of the United States.

LIST OF SYMBOLS

V_V - Sink speed, feet per second

Subscripts:

N - Nose wheel touchdown

P - Port wheel touchdown

S - Starboard wheel touchdown

A - Average of both main wheels at first main wheel touchdown

K_{LE} - Wing lift factor

V_W - Wind velocity over deck, knots

V_E - Engaging speed, knots

$V_{P'AF}$ - Approach speed, knots

$V_{P'A_{min}}$ - Minimum usable power approach airspeed, knots

$V_{SP'A}$ - Power approach stall speed, knots

$K_{V_{P'A_{min}}}$ - Ratio of measured approach speed to minimum power approach speed

$K_{V_{SP'A}}$ - Ratio of measured approach speed to power approach stall speed

θ_p - Aircraft pitch angle, degrees and (radians); positive values indicate nose up attitude measured from fuselage reference line to horizontal

Subscripts:

td - Touchdown

R - Over the ramp

θ_r - Aircraft roll angle, degrees and (radians); positive values indicate starboard wing down

$\dot{\theta}_p$ - Aircraft pitch rate at first main wheel touchdown, degrees per second and (radians per second)

$\dot{\theta}_r$ - Aircraft roll rate at first main wheel touchdown, degrees per second and (radians per second)

Y - Aircraft off-centerline distance, feet; positive values indicate port side of deck centerline

X_W - Distance from ramp to first main wheel touchdown

β_{V_V} - Aircraft instantaneous glideslope angle

β_{H_W} - Aircraft geometric glideslope angle

W - Landing weight

YAW_{td} - Aircraft yaw angle, degrees and (radians)

ϕ - Aircraft phi angle

LIST OF SYMBOLS (cont'd)

$F. P. A.$	- Aircraft flight path angle
H_W	- Height of main wheels over the ramp
H_H	- Height of the hook at the ramp
δ_{dp}	- Angle of flight deck pitch
δ_d	- Angle of flight deck roll
N	- Number of Observations in Sample
P	- Probability
S	- Standard deviation of sample distribution
A_3	- Skewness factor of sample distribution
A_4	- Kurtosis factor of sample distribution

INTRODUCTION

The NAVAL AIR DEVELOPMENT CENTER (NAVAIRDEVCEN) utilizes a 70 mm half-frame photoelectronic film system to record day and night aircraft carrier landings for determining approach and touchdown parameters. The information provided in this report was collected onboard the USS ENTERPRISE (CVN-65) during a carrier qualification period for fleet pilots. The ship was operating off the west coast of the United States during this period.

The system consists of a 70 mm half-frame camera to photograph aircraft landings, a covert infrared flasher system to illuminate night landings, and a 70 mm film reader which is used to digitize approaching aircraft position. The analysis techniques of reference (a) are used to develop a statistical presentation of the desired aircraft landing parameters by aircraft model type and series.

Data included in this report was derived from the following sources:

1. Day/night photographic records obtained during this survey.
2. Ship's logs. (Fuel weights, arresting gear runout)
3. Ship's pitch and roll data which is automatically recorded on the 70 mm film from the ship's gyro compass.
4. Ship's anemometer for wind over deck measurement.
5. Ship's instrumentation for ship speed, barometric pressure and outside air temperature.

The landing parameters included in this report are listed and defined in section 3.0 of this report.

ACKNOWLEDGEMENT

We express our thanks and appreciation to the Officers and Crew of the USS ENTERPRISE, CVN-65, and in particular to the Air department and V-1 Division , for their outstanding assistance and professional support provided to the NAVAIRDEVCON Survey Team during this Landing loads Survey.

LANDING LOADS SURVEY DEFINITIONS

SINK SPEED V_V

The sink speed of the aircraft landing gear wheel just prior to touchdown. Sink speed is reported for each landing gear individually; that is for the Port, Starboard and Nose wheels just prior to individual deck contact. In addition the Average sink speed of the aircraft main landing gear is calculated just prior to touchdown of the first main landing gear wheel. Sink Speed is determined from film data. The symbols used to identify aircraft sink speed are as follows:

- V_{V_A} -average sink speed
- V_{V_S} -sink speed of the starboard main wheel
- V_{V_P} -sink speed of the port main wheel
- V_{V_N} -sink speed of the nose landing gear

The values of aircraft sink speed are reported in Feet per second (ft/sec)

For shipboard landings the values of sink speed are reported with respect to the vessel's flight deck.

WING LIFT FACTOR K_{LE}

The Wing Lift Factor is calculated from the derivative of the aircraft average sink speed. It is calculated just prior to the touchdown of the first main landing gear. A value of 1.0 for the Wing Lift Factor indicates that a constant sink speed is being maintained. If the value of K_{LE} is greater than 1.0, this indicates that the sink speed is decreasing and the wing lift is greater than 1.0 G. Conversely, if the value is less than 1.0 then the sink speed is increasing and the lift being generated is less than 1.0 G. The value of Wing Lift Factor is calculated from the equation

$$K_{LE} = \frac{1}{32} \times \frac{d^2Y}{dt^2} + 1.0$$

where the value of Y is the aircraft vertical position with respect to time; the derivative is evaluated at touchdown ($t=0$). The regression curve is that calculated for the average vertical position of the Aircraft Main Landing Gear and has the form of the equation

$$\text{Vertical Position } Y = A + Bt + Ct^2$$

The symbol for Wing Lift Factor is K_{LE}

This quantity is dimensionless.

The value of Wing Lift Factor is measured with respect to the flight deck (this value could be referenced to the horizon by correcting it for deck pitch angle).

WIND OVER DECK V_W

Wind Over Deck is the wind velocity measured by the ships instrumentation with respect to the flight deck. For aircraft carrier landings, the wind component down the landing deck is utilized. The Positive direction for Wind Over Deck is from the ships bow to the stern, down the angle deck.

The symbol for Wind Over Deck is V_W

The value of Wind Over Deck is reported in Knots.

ENGAGING SPEED V_E

The Engaging Speed is the speed with which the aircraft closes on the aircraft carrier's flight deck. Engaging Speed is reported with respect to the flight deck. Engaging Speed is calculated from film measurements.

The symbol for Engaging Speed is V_E

The value of Engaging Speed is reported in Knots.

APPROACH SPEED V_{PAF}

The value of Approach Speed reported is the algebraic sum of engaging speed and component of wind over deck parallel to the centerline of the angle deck. The value of approach speed is the aircraft horizontal velocity with respect to the air mass.

The symbol for Approach Speed is V_{PAF}

The value of Approach Speed is reported in Knots.

MINIMUM POWER APPROACH SPEED $V_{PA_{min}}$

This value is the Minimum Power Approach Speed for a jet aircraft in the power approach configuration (landing gear, flaps, and other high lift devices deployed). This number is determined from the aircraft's aerodynamic characteristics and landing weight per criteria established by NAVAIR.

The symbol for Minimum Power Approach Speed is $V_{PA_{min}}$

The value of Minimum Power Approach Speed is reported in Knots.

POWER APPROACH STALL SPEED V_{SPA}

This value is the Power Approach Stall Speed for a propeller driven aircraft in the power approach configuration (landing gear, flaps, and other high lift devices deployed). This number is determined from the aircraft's aerodynamic characteristics and landing weight per criteria established by NAVAIR.

The symbol for Power Approach Stall Speed is V_{SPA}

The value of Power Approach Stall Speed is reported in Knots.

RATIO OF MEASURED APPROACH SPEED TO MINIMUM POWER APPROACH SPEED K_{VPAmin}

The ratio of the jet aircraft approach speed determined from film data to the minimum power approach speed for the same landing weight.

The symbol for the Ratio $\frac{V_{PAF}}{V_{PAmin}}$ is K_{VPAmin}

This quantity is dimensionless.

RATIO OF MEASURED APPROACH SPEED TO POWER APPROACH STALL SPEED K_{VSPA}

The ratio of the propeller driven aircraft measured approach speed, determined from film data, to the aircraft power approach stall speed, for the same value of landing weight.

The symbol for the Ratio $\frac{V_{PAF}}{V_{SPA}}$ is K_{VSPA}

This quantity is dimensionless.

AIRCRAFT PITCH ANGLE θ_p

The Aircraft Pitch Angle measured between the aircraft reference line and a line parallel with the aircraft carrier flight deck. Positive values of Pitch Angle are reported for an aircraft exhibiting a nose up attitude. Pitch Angle is determined from film data.

The symbol used for Pitch Angle is θ_p

The value of this quantity is reported in both Degrees and Radians.

The value of Pitch Angle is reported at two locations; just prior to first wheel touchdown and as the aircraft flies "over the ramp" at the stern end of an aircraft carrier flight deck.

θ_{pR} - over the ramp

θ_{pL} - at touchdown

AIRCRAFT ROLL ANGLE θ_r

The Aircraft Roll angle measured between the aircraft reference line and a line parallel with the aircraft carrier flight deck. Positive values of Roll Angle are reported for an aircraft whose starboard wing is down. Roll Angle is determined from film data.

The symbol used for Roll Angle is θ_r

The value of this quantity is reported in both Degrees and Radians.

The value of Roll Angle is reported at two locations: just prior to first wheel touchdown and as the aircraft flies "over the ramp" at the stern end of an aircraft carrier flight deck.

$\theta_{r,r}$ - over the ramp

$\theta_{r,t}$ - at touchdown

AIRCRAFT PITCH RATE $\dot{\theta}_p$

The Aircraft Pitch Rate is calculated from the film data. It is reported just prior to the touchdown of the first main wheel. Positive values of this variable indicates that the aircraft nose is pitching down. This rate is determined with respect to the flight deck.

The symbol used for this quantity is $\dot{\theta}_p$

The value of this quantity is reported in both Degrees per second (deg/sec) and Radians per second (rad/sec)

AIRCRAFT ROLL RATE $\dot{\theta}_r$

The Aircraft Roll Rate is calculated from the film data. It is reported just prior to the touchdown of the first main wheel. Positive values of this variable indicate that the aircraft is rolling to port. This rate is determined with respect to the flight deck.

The symbol used for this quantity is $\dot{\theta}_r$

The value of this quantity is reported in both Degrees per second (deg/sec) and Radians per second (rad/sec)

AIRCRAFT OFF-CENTERLINE DISTANCE Y

This is the perpendicular distance measured between the aircraft centerline and the centerline of the flight deck (or runway). This value is calculated from film data just prior to first main wheel touchdown. Positive values of this quantity indicate that the aircraft landed on the Port side of the Flight Deck centerline.

The symbol for this quantity is Y

The value of this quantity is reported in Feet (ft).

DISTANCE FROM RAMP TO FIRST MAIN WHEEL TOUCHDOWN X_W

For aircraft carrier landings the distance between the flight deck ramp (aft end of the flight deck) and the point of first main wheel touchdown is determined from the film data. For land based surveys, this distance can be determined from an appropriate reference line with respect to the camera.

The symbol for this quantity is X_W

The value of this quantity is reported in Feet (ft).

AIRCRAFT INSTANTANEOUS GLIDESLOPE ANGLE β_{V_V}

This angle is determined just prior to first main wheel touchdown. The value of average sink speed (V_{V_A}) and engaging speed (V_E) are used to define the instantaneous glideslope. These values are entered into the equation

$$\beta_{V_V} = \arctan \left[\frac{V_{V_A}}{V_E} \right] + \text{deck pitch angle}$$

NOTE: A Consistent set of units must be used in this equation.

The symbol for this quantity is β_{V_V}

The value of this quantity is reported in Degrees and Radians.

AIRCRAFT GEOMETRIC GLIDESLOPE ANGLE β_{H_W}

This angle is determined by utilizing the distance from the ramp to touchdown (X_W) and height of main wheels at the ramp (H_W). These values are substituted into the equation

$$\beta_{H_W} = \arctan \left[\frac{V_{E_M} - SS}{V_{E_M}} \times \frac{H_W}{X_W} \right] + \delta_d$$

where SS is Ship Speed and δ_d is angle of flight deck pitch at touchdown.

The quantity $\frac{V_{E_M} - SS}{V_{E_M}}$ is a

correction factor for ship's forward motion during the time the aircraft flies from the Ramp position to Touchdown.

NOTE: A consistent set of units must be used in this equation.

The symbol for this quantity is β_{H_W}

LANDING WEIGHT W

The landing weight reported in the survey is determined from aircraft basic weight and the reported fuel state on aircraft final approach (the Ball State). The type and quantity of any external stores is also included in the determination of landing weight.

The symbol for this quantity is W

The value of this quantity is reported in Pounds.

AIRCRAFT YAW ANGLE YAW_{α}

The Yaw Angle is the angle between the aircraft centerline and the aircraft flight path at the point of first main wheel touchdown. Positive YAW Angle is defined to be that orientation where a clockwise rotation of the flight path vector causes the vector to coincide with the aircraft centerline using a minimum angular rotation. Yaw Angle is determined from film data.

The symbol for this quantity is YAW_{α}

The value of this quantity is reported in Degrees and Radians.

AIRCRAFT PHI ANGLE ϕ

The phi angle is the angle between the aircraft centerline and the flight deck (or runway) centerline at the point of first main wheel touchdown. Positive Phi angle is defined to be that orientation where a clockwise rotation of the flight deck centerline causes it to coincide with the aircraft centerline using a minimum angular rotation. Phi angle is determined from film data.

The symbol for this quantity is ϕ

The value of this quantity is reported in Degrees and Radians.

AIRCRAFT FLIGHT PATH ANGLE $F. P. A.$

The Flight Path Angle is the angle between the aircraft flight path and the flight deck centerline at the point of touchdown. This measurement is determined from film data. Positive Flight Path Angle is defined to be that orientation where a clockwise rotation of the flight path vector causes the vector to coincide with the flight deck centerline using a minimum angular rotation.

The Symbol for this quantity is $F. P. A.$

The value of this quantity is reported in Degrees and Radians.

HEIGHT OF MAIN WHEELS OVER THE RAMP H_w

The average height of the aircraft main landing gear wheels as it flies over the aircraft carrier ramp (aft end of flight deck) is determined from the film data. This information can also be provided for land based surveys utilizing an appropriate reference line on the runway.

The symbol for this quantity is H_w

The value of this quantity is reported in Feet.

HEIGHT OF THE HOOK AT THE RAMP H_H

The height of the aircraft arresting gear hook as it flies over the aircraft carrier ramp (aft end of flight deck) is determined from the film data. This quantity is only reported on carrier surveys.

The symbol for this quantity is H_H

This quantity is reported in Feet.

ANGLE OF FLIGHT DECK PITCH δ_p

This angle is the pitch angle of the aircraft carrier flight deck with respect to the horizon. This data is recorded from the Ships Inertial Navigation System utilizing inputs to the Fresnel Lens (Mirror Landing Aid System). This data is reported at the time of the aircraft first main wheel touchdown. This parameter is reported only for carrier landings. The positive value of this quantity indicates that the stern of the ship is up.

The symbol for this quantity is δ_p

This quantity is reported in Degrees and Radians.

ANGLE OF FLIGHT DECK ROLL δ_r

This angle is the roll angle of the aircraft carrier flight deck with respect to the horizon. This data is recorded from the Ships Inertial Navigation System utilizing inputs to the Fresnel Lens (Mirror Landing Aid System). This data is reported at the time of the aircraft first main wheel touchdown. This parameter is reported only for carrier landings. The positive value of this quantity indicates that the starboard side of the ship is down.

The symbol for this quantity is δ_r

This quantity is reported in Degrees and Radians.

LIST OF SUBSCRIPTS

FFE - Free Flight Engagement

F - Indicates that the data source is film data

R - indicates data reported at the "over the ramp" position.

P - Port

S - Starboard

N - Nose Wheel

A - Average

r - Roll

p - Pitch

td - Data reported at aircraft touchdown

d - Data referenced to the Flight Deck

STATISTICAL SYMBOLS

N - Number of Observations (data points)

$\bar{x}$ - Mean Value of a parameter

P - Probability

S - Standard Deviation of sample distribution

α_3 - Skewness factor of sample distribution

α_4 - Kurtosis factor of sample distribution

ANALYSIS

The relationship between the various parameters determined during a carrier landing loads survey is complex. Successfully performing a carrier landing is a significant accomplishment. The pilot is assisted in this effort by a system of instruments and landing aids which has evolved over the years. The sensitivity and accuracy of these instruments and equipment have a direct impact on the ability of the pilot to properly execute a carrier landing.

The principle instrumentation available to the pilot is the "Angle of Attack" indexer, the various cockpit glideslope displays and his observation of the fresnel lens system installed on the aircraft carrier. In addition, on many aircraft models, the pilot is assisted by an "Approach Power Compensator" or "Automatic Throttle Control". This equipment adjusts engine thrust to maintain a 1.0 g flight condition in response to various measured inputs, e.g normal acceleration, angle of attack and control surface position.

Table I is a listing of the mean values of principle landing parameters determined for the fleet aircraft covered by this survey. It provides data for both day and night landings.

Statistical tests were performed on the data. These were to determine if a significant difference exists in the mean values of the measured parameters for day and night landing operations. This was done for each model of aircraft. Table II identifies those combinations of parameters and aircraft models which exhibit statistically significant differences in mean values at a 95% confidence limit or higher.

The interrelationships between the various flight parameters involved in carrier landings is described in Table II. Those aircraft models which have a significant difference in landing weight should also show a significant difference in approach speed. Approach speed and landing weight are linearly related. When a significant difference between the values of "wind over deck" for day and night landings occurs, then engaging speeds should change for landings of the same landing weight. If landing weight and wind over deck change, then engaging speed and approach speed must change. Glideslope angle should remain constant, any change in sink speed should be accompanied with a corresponding change in engaging speed.

The only parameter which should remain constant during a carrier landing is glideslope angle. See Table III. The pilot is attempting to fly down a prescribed glideslope, normally 3.5 degrees, which is maintained by the carrier's fresnel lens system. Glideslope should be independent of aircraft landing weight, wind over deck or even aircraft type. Table I indicates that the survey data varies from the expected result. The mean value of instantaneous glideslope was 2.9 degrees during the day and 3.1 degrees at night. The small variations of survey glideslope angle from the expected value of 3.5 degrees can

be attributed to the tolerances on the measured values of sink speed (± 1.0 ft/sec) and engaging speed (± 2.0 knots) for individual landings used in the calculation, along with rounding errors in the recorded deck pitch and minor angular misalignments in camera installation.

The value of instantaneous glideslope determined from our analysis program is calculated from the value of the tangent of the ratio of the average sink speed at touchdown with the engaging speed at touchdown.

$$\beta_{VV} = \tan (V_{va}/V_e) + \text{flight deck pitch angle}$$

This equation correctly provides the angle of the aircraft with the horizon. This is the same angle that the pilot is following as he attempts to land by following the 3.5 degree angle established by the fresnel lens system. At any instant in time, the pilot observes the "ball" centered in the lens. The lens mechanism is stabilized to compensate for carrier flight deck motion, (pitch and roll).

Review of the measured approach speed listed in table I indicates that these values are higher than would be expected for the reported value of mean landing weight. These values were compared with the appropriate NATOPS approach speed curves. These comparisons are listed in table IV. Plots of the individual landings approach speed versus landing weight were generated and are provided as figures 1 through 16. Day and night plots are provided for all model aircraft in this Survey except the TA-3, which had only 23 landings recorded. The corresponding NATOPS curves were included in the plots. As can be seen from these curves, the aircraft are flying approach speeds higher than the recommended NATOPS values.

The recommended NATOPS approach speed curves provide a relationship between aircraft approach speed and landing weight. The typical variation is to add one to two knots of approach speed for each additional thousand pounds of aircraft landing weight. These curves are prepared from flight test data for an aircraft flying an "on-speed" approach at the proper aircraft "angle of attack" and descending on the prescribed 3.5 degree glideslope. These curves also must assume a value of "wind over deck" to convert the recommended approach speed to a value of aircraft engaging speed. The engaging speed limits are established by limits on the aircraft arresting gear hook loads, as well as the energy absorption capabilities of the arresting gear on the aircraft carrier. If any of these variables are different during an actual carrier landing, then the reported approach speed will vary from the NATOPS value.

The sensitivity of aircraft approach speed to angle of attack varies considerably for different aircraft models. The difference in a "slightly fast" approach over an "on-speed" approach for an A-7E can be as much as six knots in approach speed. Other models vary by two or three knots for the same

range of angle of attack variation. The Approach Speed for an A-6 Aircraft increases by 4.5 knots if external stores are carried during the landing. These variations account for a significant portion of the differences in A-6 and A-7 engaging speeds listed in table I.

Similarly, the tolerances in glideslope angle can have an effect on the reported value of aircraft approach speed. The aircraft carrier provides glideslope information to the pilot by means of an Automatic Carrier Landing System. This information is provided to the pilot both on cockpit displays and on the "HEADS UP DISPLAY". The full scale deflection of these displays indicate a vertical misalignment of the aircraft to the glideslope of ± 1.4 degrees. For small values of glideslope misalignment, the instrumentation will provide a proportional deflection of the glideslope displays. Given the range of this proportional indication, a variation of 10 % , (± 0.14 degrees) would not be an unreasonable tolerance to expect on the angle being maintained by the pilot. A similar or greater tolerance would be expected if the pilot was flying without using the ACLS system and making a non-precision visual approach.

As an additional check on the survey results, the values of aircraft engaging speed plus 20 knots were plotted against landing weight for the F-14, F-18 and A-7E aircraft. These plots are included as figures 17 thru 22. The value of twenty knots was chosen since MIL-A-8863 defines engaging speed to be approach speed minus twenty knots. Our program calculates approach speed from engaging speed and reported value of "wind over deck". Engaging speed is derived directly from our film image data. These plots show considerably better agreement between the reported data and the NATOPS curves, particularly for the night landing data.

Aircraft sink speed was also plotted as a function of engaging speed for the F-14, F-18 and A-7 aircraft. These plots are included as figures 23 thru 28. A tolerance band generated from the sink speed equations of table I of MIL-A-8863 was included on these plots. The sink speed data from this survey does fall in the band defined by the specification.

In light of the above considerations, the observed variations in aircraft landing performance observed in this survey can readily be ascribed to these instrumentation tolerances and the various flight conditions experienced by the pilots. The observed differences between day and night landings, higher glideslope angle, higher sink speeds and better agreement of the data with the recommended NATOPS approach speed at night, can be explained by the increased time that the pilot has to "fine tune" his approach. At night, the pace of landing operations is considerably slower and the pilot is established on his glideslope at a significantly greater distance from the ship than during daylight visual flight operations. Typically, the pilot turns onto the glideslope at a distance of 3 to 3.5 miles at night compared to distance of from one to one and one half miles from the

ship during the day. Additionally, it must be noted that the approach speed reported from our survey depends on the accuracy of the "wind over deck" measurement taken onboard the aircraft carrier. Local disturbances caused by the ships configuration and motion can cause this value to vary from the wind conditions experienced by the aircraft in the air mass behind the ship. The value of NATOPS Approach Speed depends on an accurate estimate of Aircraft Landing Weight which is based on fuel state reported by the pilot on final approach, basic weight of the aircraft involved and the weight of any external stores carried on the aircraft. An error of several hundred pounds could be made in this weight calculation. These considerations, coupled with a loss of visual references at night, which may focus the pilots attention on his landing aids, are sufficient to account for the minor differences between day and night landings observed during this survey.

CONCLUSIONS

The data analyzed from Survey 45 leads to the following conclusions:

1. Statistically significant differences in the mean values of sink speed, engaging speed and glideslope angle exist between day and night landing of the F-14, F-18 and A-6E aircraft. Of these three parameters, only the difference in engaging speed was significant for the A-7E. Only the F-18 and EA-6B showed an increase in the variation of glideslope angle at night when compared to the Fresnel lens setting. For the bulk of the night landings observed (80%), the pilots maintained glideslope more accurately at night than during the day. This may reflect the reduced pace of night flight operations, and the longer night landing patterns which gives the pilot a greater opportunity to establish his glideslope and angle of attack.
2. The mean values of aircraft approach speeds determined by this survey are higher than would be expected from review of the appropriate NATOPS approach speed versus landing weight curves. This variation ranged from sixteen knots for the F-18 night landings to six knots for the E-2C day landings of this survey. The distribution of measured values of sink speed are less than the sink speed values calculated from measured engaging speed as described in Mil-A-8863. The difference in mean sink speed ranged from 4.5 ft/sec lower for both day F-14 and night F-18 landings to 2.0 ft/sec lower for night F-14 landings.
3. The NATOPS approach speed curves consider only the effect of landing weight on approach speed. Individual landings are not fully defined by the NATOPS guidance. The variation in aircraft approach speed with landing weight, wind over deck conditions, external stores configuration and aircraft angle of attack are more complex than indicated by the NATOPS approach speed curves. The skill and training of the pilots are also significant in interpreting these survey results.

RECOMMENDATIONS FOR ADDITIONAL ANALYSIS AND INVESTIGATIONS

Review of the results of this survey lead to the following recommendation to the NAVAL AIR SYSTEMS COMMAND for additional analysis and investigations of aircraft landing loads:

1. That additional studies and analysis of carrier landings be authorized to determine the effect of variations in ship speed and "wind over deck" conditions on aircraft landing performance.
2. That an analytical method be developed to establish aircraft engaging speed from carrier arresting gear ram runout . This would provide an supplementary means of monitoring aircraft engaging speeds from the arresting gears recovery log sheets, which are routinely recorded on the ship and forwarded to the NAVAL AIR ENGINEERING CENTER, Lakehurst N.J. This would permit adverse trends and potential problems to be identified prior to performing a full scale carrier survey. This would aid in planning and directing future survey efforts.
3. The substantial data base of carrier landings included in this report provide an excellent source of input data for the analysis of carrier landings. The data base on field landings for carrier aircraft, which account for 50% of all landings of these aircraft, is a candidate for further study. The analysis of field landings performed during 1981 at NAS OCEANA during Survey 39 identified significantly higher sink speeds than expected for those landings. Additional surveys should be authorized to verify the adequacy of the field landings sink speed distribution in the aircraft design specification MIL-A-8866(ASG).
4. An additional area of study is the short take off and landing (STOL) operation of the AV-8B Harrier. Operational landings of this model have never been recorded by this activity, and only hover landings of the AV-8A have been surveyed.

LANDING LOADS SURVEY DEFINITIONS

SINK SPEED - V_V - The sink speed of the aircraft landing gear wheel just prior to touchdown. Sink speed is reported for each landing gear individually; that is for the port, starboard, and nose wheels just prior to individual deck contact. In addition, the Average Sink Speed of the aircraft main landing gear is calculated just prior to touchdown of the first main landing gear wheel. Sink speed is determined from film data.

The symbols used to identify aircraft sink speed are as follows:

- V_{VA} - average sink speed
- V_{VS} - sink speed of the starboard main wheel
- V_{VP} - sink speed of the port main wheel
- V_{VN} - sink speed of the nose landing gear

The values of aircraft sink speed are reported in both feet per second (ft/sec.) and meters per second (meters/sec.).

For shipboard landings, the values of sink speed are reported with respect to the vessels flight deck.

WING LIFT FACTOR - K_{LE} - The Wing Lift Factor is calculated from the derivative of the aircraft average sink speed. It is calculated just prior to the touchdown of the first main landing gear. A value of 1.0 for the Wing Lift Factor indicates that a constant sink speed is being maintained. If the value of K_{LE} is greater than 1.0, this indicates that the sink speed is decreasing and the wing lift is greater than 1.0 G. Conversely, if the value is less than 1.0, then the sink speed is increasing and the lift being generated is less than 1.0 G.

The value of Wing Lift Factor is calculated from the equation

$$K_{LE} = (2 \cdot C / 32.2) + 1.0$$

where the value of $2 \cdot C$ is the second derivative of the regression curve of the aircraft vertical position with respect to time, evaluated at touchdown ($t=0$). The regression curve is that calculated for the average vertical position of the aircraft main landing gear and has the form of the equation

$$\text{Position} = A + Bt + Ct^2$$

The symbol for WING LIFT FACTOR is K_{LE} . This quantity is dimensionless.

The value of wing lift factor is measured with respect to the flight deck. (This value could be referenced to the horizon by correcting it for deck pitch angle.)

WIND OVER DECK - V_W - Wind Over Deck is the wind velocity measured by the ships instrumentation with respect to the flight deck. For aircraft carrier landings, the wind component down the landing deck is utilized. The positive direction for Wind Over Deck is from the ships bow to the stern, down the angle deck.

The symbol for WIND OVER DECK is V_W .

The value of Wind Over Deck is reported in knots and meters per second.

ENGAGING SPEED - V_E - The engaging speed is the speed with which the aircraft closes on the aircraft carrier's flight deck. Engaging speed is reported with respect to the flight deck. Engaging Speed is calculated from film measurements.

The symbol for ENGAGING SPEED is V_E .

The value of Engaging Speed is reported in knots and meters per second.

The value of engaging speed measured at the "over the ramp" position is identified as V_{eor^*} .

APPROACH SPEED - V_{P-AF} - The value of Approach Speed reported is the algebraic sum of Engaging Speed and component of Wind Over Deck parallel to the centerline of the angle deck. The value of Approach Speed is the aircraft horizontal velocity with respect to the air mass.

The symbol for APPROACH SPEED is V_{P-AF} .

The value of Approach Speed is reported in knots and meters per second.

MINIMUM POWER APPROACH SPEED - V_{P-Amin} - This value is the minimum power approach speed for a jet aircraft in the power approach configuration (landing gear, flaps and other high lift devices deployed). This number is determined from the aircraft's aerodynamic characteristics and landing weight per criteria established by NAVAIR.

The symbol for MINIMUM POWER APPROACH SPEED is V_{P-Amin} .

The value of minimum power approach speed is reported in knots and meters per second.

POWER APPROACH STALL SPEED - V_{SP-A} - This value is the power approach stall speed for a propeller driven aircraft in the power approach configuration (landing gear flaps and other high lift devices deployed). This number is determined from the aircraft's aerodynamic characteristics and landing weight per criteria established by NAVAIR.

The symbol for POWER APPROACH STALL SPEED is V_{SP-A} .

The value of power approach stall speed is reported in knots and meters per second.

RATIO OF MEASURED APPROACH SPEED TO MINIMUM POWER APPROACH SPEED - $K_{VP-Amin}$
 - The ratio of the jet aircraft approach speed determined from film data to the minimum power approach speed for the same landing weight.

The symbol for the RATIO OF V_{P-AF}/V_{P-Amin} is $K_{VP-Amin}$.

This quantity is dimensionless.

RATIO OF MEASURED APPROACH SPEED TO POWER APPROACH STALL SPEED - K_{VSP-A}
 - The ratio of the propeller driven aircraft measured approach speed, determined from film data, to the aircraft power approach stall speed, for the same value of landing weight.

The symbol for the RATIO OF V_{P-AF}/V_{SP-A} is K_{VSP-A} .

This quantity is dimensionless.

AIRCRAFT PITCH ANGLE - θ_p - The aircraft pitch angle measured between the aircraft reference line and a line parallel with the aircraft carrier's flight deck. Positive values of pitch angle are reported for an aircraft exhibiting a nose up attitude. Pitch Angle is determined from film data.

The symbol used for PITCH ANGLE is θ_p .

The value of this quantity is reported in both degrees and radians.

The value of pitch angle is reported at two locations--just prior to first wheel touchdown, and as the aircraft flies "over the ramp" at the stern end of an aircraft carrier's flight deck.

SUBSCRIPTS: R - Over the ramp

td - At touchdown

AIRCRAFT ROLL ANGLE - θ_r - The Aircraft Roll angle measured between the aircraft reference line and a line parallel with the aircraft carrier's flight deck. Positive values of roll angle are reported for an aircraft whose starboard wing is down. Roll Angle is determined from film data.

The symbol used for ROLL ANGLE is θ_r .

The value of this quantity is reported in both degrees and radians.

The value of roll angle is reported at two locations; just prior to first wheel touchdown and as the aircraft flies "over the ramp" at the stern end of an aircraft carrier's flight deck.

SUBSCRIPTS: R - Over the ramp

td - At touchdown

AIRCRAFT PITCH RATE - $\dot{\theta}_p$ - The aircraft pitch rate is calculated from the film data. It is reported just prior to the touchdown of the first main wheel. Positive values of this variable indicates that the aircraft nose is pitching down. This rate is determined with respect to the flight deck.

The symbol used for THIS QUANTITY is $\dot{\theta}_p$.

The value of this quantity is reported in both degrees per second (deg./sec) and radians per second (radians/sec.).

AIRCRAFT ROLL RATE - $\dot{\theta}_r$ - The aircraft roll rate is calculated from the film data. It is reported just prior to the touchdown of the first main wheel. Positive values of this variable indicates that the aircraft is rolling to port. This rate is determined with respect to the flight deck.

The symbol used for THIS QUANTITY is $\dot{\theta}_r$.

The value of this quantity is reported in both degrees per second (deg./sec) and radians per second (radians/sec.).

AIRCRAFT OFF-CENTERLINE DISTANCE - Y - This is the perpendicular distance measured between the aircraft centerline and the centerline of the flight deck (or runway). This value is calculated from film data just prior to first main wheel touchdown. Positive values of this quantity indicate that the aircraft landed on the port side of the flight deck centerline.

The symbol for THIS QUANTITY is Y.

The value of this quantity is reported in feet (ft) and meters.

DISTANCE FROM RAMP TO FIRST MAIN WHEEL TOUCHDOWN - X_w - For aircraft carrier landings the distance between the flight deck ramp (aft end of the flight deck) and the point of first main wheel touchdown is determined from the film data. For land based surveys, this distance can be determined from an appropriate reference line with respect to the camera.

The symbol for THIS QUANTITY is X_w .

The value of this quantity is reported in feet (ft) and meters.

AIRCRAFT INSTANTANEOUS GLIDESLOPE ANGLE - β_{V_V} - This angle is determined just prior to first main wheel touchdown. The value of average sink speed (V_{V_A}) and engaging speed (V_E) are used to define the instantaneous glideslope. These values are entered into the equation;

$$\beta_{V_V} = \arctan(V_{V_A}/V_E) + \text{deck pitch angle}$$

NOTE: A Consistent set of units must be used in this equation.

The symbol for THIS QUANTITY is β_{V_V} .

The value of this quantity is reported in degrees and radians

AIRCRAFT GEOMETRIC GLIDESLOPE ANGLE - β_{HW} - This angle is determined by utilizing the Distance From The Ramp To Touchdown (X_W) and Height Of Main Wheels At The Ramp (H_W). These values are substituted into the Equation:

$$\beta_{HW} = \arctan[(V_{etd} - SS/V_{etd}) * (H_W/X_W)] + \text{deck pitch angle}$$

Where SS is Ships Speed.

The Quantity $(V_{etd} - SS/V_{etd})$ is a correction factor for ships forward motion during the time the aircraft flies from the Ramp position to Touchdown.

NOTE: A consistent set of units must be used in this equation.

The symbol for THIS QUANTITY is - β_{HW}

LANDING WEIGHT - W - The landing weight reported in the survey is determined from aircraft basic weight and the reported fuel state on aircraft final approach (the "Ball State"). The type and quantity of any external stores is also included in the determination of landing weight.

The Symbol for THIS QUANTITY is W.

The value of this quantity is reported in pounds and kilograms.

AIRCRAFT YAW ANGLE - YAW_{TD} - The Yaw Angle is the angle between the aircraft centerline and the aircraft flight path at the point of first main wheel touchdown. Positive YAW Angle is defined to be that orientation where a clockwise rotation of the yaw vector causes the vector to coincide with the aircraft centerline using a minimum angular rotation. Yaw Angle is determined from film data.

The Symbol for THIS QUANTITY is YAW_{TD} .

The value of this quantity is reported in degrees and radians.

AIRCRAFT FLIGHT PATH ANGLE - F.P.A. - The Flight Path Angle is the angle between the aircraft flight path and the flight deck centerline at the point of touchdown. This measurement is determined from film data. Positive Flight Path Angle is defined to be that orientation where a clockwise rotation of the flight path vector causes the vector to coincide with the flight deck centerline using a minimum angular rotation.

The Symbol for THIS QUANTITY is F.P.A.

The value of this quantity is reported in degrees and radians.

HEIGHT OF MAIN WHEELS OVER THE RAMP - H_W - The average height of the aircraft main landing gear wheels as it flies over the aircraft carriers ramp (aft end of flight deck) is determined from the film data. This information can also be provided for land based surveys utilizing an appropriate reference line on the runway.

The symbol for THIS QUANTITY is H_W

The value of this quantity is reported in feet and meters.

HEIGHT OF THE HOOK AT THE RAMP - H_H - The height of the aircraft arresting gear hook as it flies over the aircraft carrier's ramp (aft end of flight deck) is determined from the film data. This quantity is only reported on carrier surveys.

The symbol for THIS QUANTITY is H_H .

This quantity is reported in feet and meters.

ANGLE OF FLIGHT DECK PITCH - δD_p - This angle is the pitch angle of the aircraft carrier's flight deck with respect to the horizon. This data is recorded from the ship's inertial navigation system utilizing inputs to the Fresnel Lens (Mirror Landing Aid System). This data is reported at the time of the aircraft first main wheel touchdown. This parameter is reported only for carrier landings. The positive value of this quantity indicates that the stern of the ship is up.

The symbol for THIS QUANTITY is δD_p

This quantity is reported in degrees and radians.

ANGLE OF FLIGHT DECK ROLL - δD_r - This angle is the roll angle of the aircraft carrier's flight deck with respect to the horizon. This data is recorded from the ship's inertial navigation system utilizing inputs to the Fresnel Lens (Mirror Landing Aid System). This data is reported at the time of the aircraft's first main wheel touchdown. This parameter is reported only for carrier landings. The positive value of this quantity indicates that the starboard side of the ship is down.

The symbol for THIS QUANTITY is δD_r

This quantity is reported in degrees and radians.

LIST OF SUBSCRIPTS

FFE - Free flight Engagement
F - Indicates that the data source is film data
R - Indicates data reported at the "over the ramp" position.
P - Port
S - Starboard
N - Nose Wheel
A - Average
r - Roll
p - Pitch
td - Data reported at aircraft touchdown
d - Data referenced to the Flight Deck

STATISTICAL SYMBOLS

N - Number of observations (data points).
 $\bar{X}$ - Mean value of a parameter.
P - Probability.
S - Standard deviation of sample distribution.
 A_3 - Skewness factor of sample distribution.
 A_4 - Kurtosis factor of sample distribution.
