Certificate Information

The following Ada implementation was tested and determined to pass ACVC 1.11. Testing was completed on March 19, 1993.

Compiler Name and Version: DEC Ada for OpenVMS AXP Systems,  
Version 3.0-5

Host Computer System: DEC 3000 Model 400  
under OpenVMS AXP Operating System,  
Version 1.0

Target Computer System: DEC 3000 Model 400  
under OpenVMS AXP Operating System,  
Version 1.0

See section 3.1 for any additional information about the testing environment.

As a result of this validation effort, Validation Certificate 930319S1.11315 is awarded to Digital Equipment Corporation. This certificate expires 2 years after ANSI/MIL-STD-1815B is approved by ANSI.

This report has been reviewed and is approved.

## CHAPTER 1

### INTRODUCTION

The Ada implementation described above was tested according to the Ada Validation Procedures [Pro90] against the Ada Standard [Ada83] using the current Ada Compiler Validation Capability (ACVC). This Validation Summary Report (VSR) gives an account of the testing of this Ada implementation. For any technical terms used in this report, the reader is referred to [Pro90]. A detailed description of the ACVC may be found in the current ACVC User's Guide [UG89].

#### 1.1 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the Ada Certification Body may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject implementation has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from the AVF which performed this validation or from:

National Technical Information Service  
5285 Port Royal Road  
Springfield VA 22161

Questions regarding this report or the validation test results should be directed to the AVF which performed this validation or to:

Ada Validation Organization  
Computer and Software Engineering Division  
Institute for Defense Analyses  
1801 North Beauregard Street  
Alexandria VA 22311-1772

### 1.3 ACVC TEST CLASSES

Compliance of Ada implementations is tested by means of the ACVC. The ACVC contains a collection of test programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable. Class B and class L tests are expected to produce errors at compile time and link time, respectively.

The executable tests are written in a self-checking manner and produce a PASSED, FAILED, or NOT APPLICABLE message indicating the result when they are executed. Three Ada library units, the packages REPORT and SPRT13, and the procedure CHECK\_FILE are used for this purpose. The package REPORT also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The package SPRT13 is used by many tests for Chapter 13 of the Ada Standard. The procedure CHECK\_FILE is used to check the contents of text files written by some of the Class C tests for Chapter 14 of the Ada Standard. The operation of REPORT and CHECK\_FILE is checked by a set of executable tests. If these units are not operating correctly, validation testing is discontinued.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that all violations of the Ada Standard are detected. Some of the class B tests contain legal Ada code which must not be flagged illegal by the compiler. This behavior is also verified.

Class L tests check that an Ada implementation correctly detects violation of the Ada Standard involving multiple, separately compiled units. Errors are expected at link time, and execution is attempted.

In some tests of the ACVC, certain macro strings have to be replaced by implementation-specific values -- for example, the largest integer. A list of the values used for this implementation is provided in Appendix A. In addition to these anticipated test modifications, additional changes may be required to remove unforeseen conflicts between the tests and implementation-dependent characteristics. The modifications required for this implementation are described in section 2.3.

For each Ada implementation, a customized test suite is produced by the AVF. This customization consists of making the modifications described in the preceding paragraph, removing withdrawn tests (see section 2.1) and, possibly some inapplicable tests (see Section 3.2 and [UG89]).

In order to pass an ACVC an Ada implementation must process each test of the customized test suite according to the Ada Standard.

#### 1.4 DEFINITION OF TERMS

Ada Compiler	The software and any needed hardware that have to be added to a given host and target computer system to allow transformation of Ada programs into executable form and execution thereof.
Ada Compiler Validation Capability (ACVC)	The means for testing compliance of Ada implementations, Validation consisting of the test suite, the support programs, the ACVC Capability user's guide and the template for the validation summary (ACVC) report.
Ada Implementation	An Ada compiler with its host computer system and its target computer system.
Ada Joint Program Office (AJPO)	The part of the certification body which provides policy and guidance for the Ada certification Office system.
Ada Validation Facility (AVF)	The part of the certification body which carries out the procedures required to establish the compliance of an Ada implementation.
Ada Validation Organization (AVO)	The part of the certification body that provides technical guidance for operations of the Ada certification system.
Compliance of an Ada Implementation	The ability of the implementation to pass an ACVC an Ada version.

Computer System	A functional unit, consisting of one or more computers and associated software, that uses common storage for all or part of a program and also for all or part of the data necessary for the execution of the program; executes user-written or user-designated programs; performs user-designated data manipulation, including arithmetic operations and logic operations; and that can execute programs that modify themselves during execution. A computer system may be a stand-alone unit or may consist of several inter-connected units.
Conformity	Fulfillment by a product, process or service of all requirements specified.
Customer	An individual or corporate entity who enters into an agreement with an AVF which specifies the terms and conditions for AVF services (of any kind) to be performed.
Declaration of Conformance	A formal statement from a customer assuring that conformity is realized or attainable on the Ada implementation for which validation status is realized.
Host Computer System	A computer system where Ada source programs are transformed into executable form.
Inapplicable Test	A test that contains one or more test objectives found to be irrelevant for the given Ada implementation.
ISO	International Organization for Standardization.
LRM	The Ada standard, or Language Reference Manual, published as ANSI/MIL-STD-1815A-1983 and ISO 8652-1987. Citations from the LRM take the form "<section>.<subsection>:<paragraph>."
Operating System	Software that controls the execution of programs and that provides services such as resource allocation, scheduling, input/output control, and data management. Usually, operating systems are predominantly software, but partial or complete hardware implementations are possible.

Target Computer System	A computer system where the executable form of Ada programs are executed.
Validated Ada Compiler	The compiler of a validated Ada implementation.
Validated Ada Implementation	An Ada implementation that has been validated successfully either by AVF testing or by registration [Pro90].
Validation	The process of checking the conformity of an Ada compiler to the Ada programming language and of issuing a certificate for this implementation.
Withdrawn Test	A test found to be incorrect and not used in conformity testing. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains erroneous or illegal use of the Ada programming language.

## CHAPTER 2

### IMPLEMENTATION DEPENDENCIES

#### 2.1 WITHDRAWN TESTS

Some tests are withdrawn by the AVO from the ACVC because they do not conform to the Ada Standard. The following 95 tests had been withdrawn by the Ada Validation Organization (AVO) at the time of validation testing. The rationale for withdrawing each test is available from either the AVO or the AVF. The publication date for this list of withdrawn tests is 91-08-02.

E28005C	B28006C	C32203A	C34006D	C35508I	C35508J

CE3111C	CE3116A	CE3118A	CE3411B	CE3412B	CE3607B
CE3607C	CE3607D	CE3812A	CE3814A	CE3902B	

#### 2.2 INAPPLICABLE TESTS

A test is inapplicable if it contains test objectives which are irrelevant for a given Ada implementation. The inapplicability criteria for some tests are explained in documents issued by ISO and the AJPO known as Ada Commentaries and commonly referenced in the format AI-ddddd. For this implementation, the following tests were determined to be inapplicable for the reasons indicated; references to Ada Commentaries are included as appropriate.

The following 198 tests have floating-point type declarations requiring more digits than SYSTEM.MAX\_DIGITS:

C24113L..V (11 tests)	C35705L..Y (14 tests)
C35706L..Y (14 tests)	C35707L..Y (14 tests)
C35708L..Y (14 tests)	C35802L..Z (15 tests)

C45241L..Y (14 tests)	C45321L..Y (14 tests)
C45421L..Y (14 tests)	C45521L..Z (15 tests)
C45524L..Z (15 tests)	C45621L..Z (15 tests)
C45641L..Y (14 tests)	C46012L..Z (15 tests)

C24113W..Y (3 tests) contain lines that exceed this implementation's maximum input-line length of 255 characters.

C35713B, C45423B, B86001T, and C86006H check for the predefined type `SHORT_FLOAT`; for this implementation, there is no such type.

C35713D and B86001Z check for a predefined floating-point type with a name other than `FLOAT`, `LONG_FLOAT`, or `SHORT_FLOAT`; for this implementation, there is no such type.

C45531M..P and C45532M..P (8 tests) check fixed-point operations for types that require a `SYSTEM.MAX_MANTISSA` of 47 or greater; for this implementation, `MAX_MANTISSA` is less than 47.

C45624A..B (2 tests) check that the proper exception is raised if `MACHINE_OVERFLOW` is `FALSE` for floating point types and the results of various floating-point operations lie outside the range of the base type; for this implementation, `MACHINE_OVERFLOW` is `TRUE`.

B86001Y uses the name of a predefined fixed-point type other than type `DURATION`; for this implementation, there is no such type.

B91001H checks that an address clause may not precede an entry declaration; this implementation does not support address clauses for entries. (See section 2.3.)

C96005B uses values of type `DURATION`'s base type that are outside the range of type `DURATION`; for this implementation, the ranges are the same.

CD1009C checks whether a length clause can specify a non-default size for a floating-point type; this implementation does not support such sizes.

CD2A84A, CD2A84E, CD2A84I..J (2 tests), and CD2A84O use length clauses to specify non-default sizes for access types; this implementation does not support such sizes.

CD2B15B checks that `STORAGE_ERROR` is raised when the storage size specified for a collection is too small to hold a single value of the designated type; this implementation allocates more space than was specified by the length clause, as allowed by AI-00558.

BD8001A, BD8003A, BD8004A..B (2 tests), and AD8011A use machine code insertions; this implementation provides no package `MACHINE_CODE`.

The 18 tests listed in the following table check that USE\_ERROR is raised if the given file operations are not supported for the given combination of mode and access method; this implementation supports these operations.

Test	File Operation	Mode	File Access Method
CE2102E	CREATE	OUT_FILE	SEQUENTIAL_IO
CE2102F	CREATE	INOUT_FILE	DIRECT_IO
CE2102J	CREATE	OUT_FILE	DIRECT_IO
CE2102N	OPEN	IN_FILE	SEQUENTIAL_IO
CE2102O	RESET	IN_FILE	SEQUENTIAL_IO
CE2102P	OPEN	OUT_FILE	SEQUENTIAL_IO
CE2102Q	RESET	OUT_FILE	SEQUENTIAL_IO
CE2102R	OPEN	INOUT_FILE	DIRECT_IO
CE2102S	RESET	INOUT_FILE	DIRECT_IO
CE2102T	OPEN	IN_FILE	DIRECT_IO
CE2102U	RESET	IN_FILE	DIRECT_IO
CE2102V	OPEN	OUT_FILE	DIRECT_IO
CE2102W	RESET	OUT_FILE	DIRECT_IO
CE3102F	RESET	Any_Mode	TEXT_IO
CE3102G	DELETE	-----	TEXT_IO
CE3102I	CREATE	OUT_FILE	TEXT_IO
CE3102J	OPEN	IN_FILE	TEXT_IO
CE3102K	OPEN	OUT_FILE	TEXT_IO

The tests listed in the following table check the given file operations for the given combination of mode and access method; this implementation does not support these operations.

Test	File Operation	Mode	File Access Method
CE2105A	CREATE	IN_FILE	SEQUENTIAL_IO
CE2105B	CREATE	IN_FILE	DIRECT_IO
CE3109A	CREATE	IN_FILE	TEXT_IO

The following 12 tests check operations on sequential, direct, and text files when multiple internal files are associated with the same external file and one or more are open for writing; USE\_ERROR is raised when this association is attempted.

CE2107B	CE2107E	CE2107G	CE2110B	CE2110D
CE2111D	CE2111H	CE3111B	CE3111D..E	CE3114B
CE3115A				

CE2107C..D (2 tests), CE2107H, and CE2107L apply function NAME to temporary sequential, direct, and text files in an attempt to associate multiple internal files with the same external file; USE\_ERROR is raised because temporary files have no name.

CE2108B, CE2108D, and CE3112B use the names of temporary sequential, direct, and text files that were created in other tests in order to check that the temporary files are not accessible after the completion of those tests; for this implementation, temporary files have no name.

CE2111C checks that a supplied mode parameter can be RESET from IN\_FILE to OUT\_FILE (an amplification in accessing privileges while the external file is being accessed). The proper exception is raised.

CE2203A checks that WRITE raises USE\_ERROR if the capacity of an external sequential file is exceeded; this implementation cannot restrict file capacity.

CE2401H, EE2401D, and EE2401G use instantiations of DIRECT\_IO with unconstrained array and record types; this implementation raises USE\_ERROR on the attempt to create a file of such types.

CE2403A checks that WRITE raises USE\_ERROR if the capacity of an external direct file is exceeded; this implementation cannot restrict file capacity.

CE3413B checks that PAGE raises LAYOUT\_ERROR when the value of the page number exceeds COUNT'LAST; for this implementation, the value of COUNT'LAST is greater than 150000, making the checking of this objective impractical.

### 2.3 TEST MODIFICATIONS

Modifications (see section 1.3) were required for 22 tests.

The 21 tests listed below were graded passed by Processing Modification as directed by the AVO. These tests make various checks that CONSTRAINT\_ERROR is raised for certain operations when the resultant values lie outside of the range of the subtype. However, in many of the particular checks that these tests make, the exception-raising operation may be avoided as per LRM 11.6(7) by optimization that removes the operation if its only possible effect is to raise an exception (e.g., an assignment to a variable that is not later referenced). In the list below, beside the name of each affected test are given the line numbers of either the checks that are skipped or the call to FAILED that is made--numbers will be within brackets in the latter case. These tests were processed both with and without optimization: the tests reported a passed result without optimization; with optimization, the checks indicated below were skipped and REPORT.FAILED was called (in the case of C38202A, execution is suspended as one task waits for call that is avoided).

Check [Failed] Line #

Summary: Elimination of assignment statements

C36204A	113 & 118
C36305A	53 & 48
C38202A	35 (task DRIVER hangs)
C45614A	47 & 59
C94001E & C94001F	36
CC3305A	37
CC3305B..D	33

Summary: Exception not raised before or after call

C64103A	51, 91, & 119
C64103B	90 & 99
C64104A	90, 103, 114, 126, 142, 158, & 174
C64104N	[62]
CE3704C	109
CE3804F	114
CE3804P	113

Summary: Dead-store elimination.

CB4006A [41 & 60] (line 29 initialization is eliminated)

Summary: Generic formal object only used in eliminated assignment.

CC3125B	64, & 113
CC3125C	51, 64, 100, & 113
CC3125D	51, 64, 100, & 113

B91001H was graded inapplicable by Evaluation Modification as directed by the AVO. This test expects an error to be cited for an entry declaration that follows an address clause for a preceding entry; but this implementation does not support address clauses for entries (rather, it provides a package that allows a task to wait for the delivery of one or more signals), and so rejects the address clause.

## CHAPTER 3

### PROCESSING INFORMATION

#### 3.1 TESTING ENVIRONMENT

The Ada implementation tested in this validation effort is described adequately by the information given in the initial pages of this report.

For technical and sales information about this Ada implementation, contact:

Attn: Maryanne Cacciola  
Ada Product Manager  
Digital Equipment Corporation  
110 Spit Brook Road (ZKO2-1/M11)  
Nashua, NH 03062  
(603) 881-1028

Testing of this Ada implementation was conducted at the customer's site by a validation team from the AVF.

#### 3.2 SUMMARY OF TEST RESULTS

An Ada Implementation passes a given ACVC version if it processes each test of the customized test suite in accordance with the Ada Programming Language Standard, whether the test is applicable or inapplicable; otherwise, the Ada Implementation fails the ACVC [Pro90].

For all processed tests (inapplicable and applicable), a result was obtained that conforms to the Ada Programming Language Standard.

The list of items below gives the number of ACVC tests in various categories. All tests were processed, except those that were withdrawn because of test errors (item b; see section 2.1), those that require a floating-point precision that exceeds the implementation's maximum precision (item e; see section 2.2), and those that depend on the support of a file system -- if none is supported (item d). All tests passed, except those that are listed in sections 2.1 and 2.2 (counted in items b and f, below).

a) Total Number of Applicable Tests	3796
b) Total Number of Withdrawn Tests	95
c) Processed Inapplicable Tests	279
d) Non-Processed I/O Tests	0
e) Non-Processed Floating-Point Precision Tests	0

f) Total Number of Inapplicable Tests 279 (c+d+e)  
g) Total Number of Tests for ACVC 1.11 4170 (a+b+f)

### 3.3 TEST EXECUTION

A magnetic tape containing the customized test suite (see section 1.3) was taken on-site by the validation team for processing. The contents of the magnetic tape were loaded onto VAX 6000 Model 350 and transferred to the host/target computer by Ethernet.

After the test files were loaded onto the host/target computer, the full set of tests was processed by the Ada implementation.

The tests were compiled, linked, and executed on the host/target computer system, as appropriate. The results were captured on the host/target computer system. The test results were transferred from the host/target computer to the VAX 6000 Model 350 where a magnetic was written capturing the test results.

Testing was performed using command scripts provided by the customer and reviewed by the validation team. See Appendix B for a complete listing of the processing options for this implementation. It also indicates the default options. The options invoked explicitly for validation testing during this test were:

```
ADA/COPY_SOURCE/NODEBUG/NODIAG/ERROR_LIMIT=1000/LIST/NOSHOW
```

Test output, compiler and linker listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

## APPENDIX A

### MACRO PARAMETERS

This appendix contains the macro parameters used for customizing the ACVC. The meaning and purpose of these parameters are explained in [UG89]. The parameter values are presented in two tables. The first table lists the values that are defined in terms of the maximum input-line length, which is the value for \$MAX\_IN\_LEN--also listed here. These values are expressed here as Ada string aggregates, where "V" represents the maximum input-line length.

Macro Parameter	Macro Value
\$MAX_IN_LEN	255-- Value of V
\$BIG_ID1	(1..V-1 => 'A', V => '1')
\$BIG_ID2	(1..V-1 => 'A', V => '2')
\$BIG_ID3	(1..V/2 => 'A') & '3' & (1..V-1-V/2 => 'A')
\$BIG_ID4	(1..V/2 => 'A') & '4' & (1..V-1-V/2 => 'A')
\$BIG_INT_LIT	(1..V-3 => '0') & "298"
\$BIG_REAL_LIT	(1..V-5 => '0') & "690.0"
\$BIG_STRING1	'"' & (1..V/2 => 'A') & "'"
\$BIG_STRING2	'"' & (1..V-1-V/2 => 'A') & '1' & "'"
\$BLANKS	(1..V-20 => ' ')
\$MAX_LEN_INT_BASED_LITERAL	"2:" & (1..V-5 => '0') & "11:"
\$MAX_LEN_REAL_BASED_LITERAL	"16:" & (1..V-7 => '0') & "F.E:"
\$MAX_STRING_LITERAL	'"' & (1..V-2 => 'A') & "'"

The following table contains the values for the remaining macro parameters.

Macro Parameter	Macro Value
\$ACC_SIZE	32
\$ALIGNMENT	4
\$COUNT_LAST	2_147_483_647
\$DEFAULT_MEM_SIZE	2**31-1

## APPENDIX B

### COMPILATION SYSTEM OPTIONS

The compiler options of this Ada implementation, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this appendix are to compiler documentation and not to this report.

Compiler options for DEC Ada hosted on OpenVMS VAX and OpenVMS AXP systems

The default compiler options were used except as follows:

1. /LIST was used to produce compiler listings.
2. /NODEBUG was used to inhibit the generation of debugging information in the object file since such information is not relevant to validation.
3. /ERROR\_LIMIT-1000 was used since more than 30 errors are diagnosed for some validation tests.
4. /NOSHOW was used to exclude portability information from the compiler listings

The DEC Ada compiler options and defaults for OpenVMS VAX and OpenVMS AXP systems are summarized as follows:

- o /ANALYSIS\_DATA or /NOANALYSIS\_DATA

Controls whether a data analysis file containing source code cross-referencing and static analysis information is created. The default is /NOANALYSIS\_DATA.

- o /CHECK or /NOCHECK

Controls whether run-time error checking is suppressed. (Use of /NOCHECK is equivalent to giving all possible suppress pragmas in the source program.) The default is /CHECK (error checking is not suppressed except by pragma).

- o /COPY\_SOURCE or /NOCOPY\_SOURCE

Controls whether the source being compiled is copied into the compilation library for a successful compilation. The default is /COPY\_SOURCE.

- o /DEBUG or /NODEBUG or /DEBUG=option

where option is one of

ALL, SYMBOLS or NOSYMBOLS, TRACEBACK or NOTRACEBACK, or NONE

Controls the inclusion of debugging symbol table information in the compiled object module. The default is /DEBUG or, equivalently, /DEBUG-ALL.

- o /DESIGN or /NODESIGN

Controls whether the input file is processed as a design or compiled as an Ada source. The default is /NODESIGN, in

which case the file is compiled.

- o /DIAGNOSTICS, /DIAGNOSTICS=file-name, or /NODIAGNOSTICS

Controls whether a special diagnostics file is produced for use with the VAX Language-Sensitive Editor (a separate DIGITAL product). The default is /NODIAGNOSTICS.

- o /ERROR\_LIMIT=n

Controls the number of error level diagnostics that are allowed within a single compilation unit before the compilation is aborted. The default is /ERROR\_LIMIT=30.

- o /LIBRARY=directory-name

Specifies the name of the Ada compilation library to be used as the context for the compilation. The default is the library last established by the ACS SET LIBRARY command.

- o /LIST, /LIST=file-name, or /NOLIST

Controls whether a listing file is produced. /LIST without a file-name uses a default file-name of the form sourcename.LIS, where sourcename is the name of the source file being compiled. The default is /NOLIST (for both interactive and batch mode).

- o /LOAD or /NOLOAD

Controls whether the current program library is updated with successfully processed units contained in the source file. The default is /LOAD,

- o /MACHINE\_CODE or /NOMACHINE\_CODE

Controls whether generated machine code (approximating assembler notation) is included in the listing file, if produced. The default is /NOMACHINE\_CODE.

- o /NOTE\_SOURCE or /NONOTE\_SOURCE

Controls whether the file specification of the current source file is noted in the compilation library. (This copy is used for certain automated (re)compilation features.) The default is /NOTE\_SOURCE.

- o /OPTIMIZE or /NOOPTIMIZE

Controls whether full or minimal optimization is applied in producing the compiled code. The default is /OPTIMIZE. (/NOOPTIMIZE is primarily of use in combination with /DEBUG.)

- o /SYNTAX\_ONLY or /NOSYNTAX\_ONLY

Controls whether a syntax check only is performed. The default is /NOSYNTAX\_ONLY, which indicates that full processing is done.

- o /SHOW-PORTABILITY or /NOSHOW

Controls whether a portability summary is included in the listing. The default is /SHOW-PORTABILITY.

- o /WARNINGS=(category:destination,...)

Specifies which categories of informational and warning level messages are displayed for which destinations. The categories can be WARNINGS, WEAK\_WARNINGS, SUPPLEMENTAL, COMPILATION\_NOTES and STATUS. The destinations can be ALL, NONE or combinations of TERMINAL, LISTING or DIAGNOSTICS. The default is

/WARNINGS=(WARN:ALL,WEAK:ALL,SUPP:ALL,COMP:NONE,STAT:LIST)

## LINKER OPTIONS

The linker options of this Ada implementation, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this appendix are to linker documentation and not to this report.

## Linker options for DEC Ada hosted on OpenVMS VAX and OpenVMS AXP systems

DEC Ada programs are linked using the "ACS LINK" command. The default ACS LINK options were used except as follows:

1. /COMMAND was used. ACS LINK checks that all units in a program are current and writes a command file to create the executable image using the VMS linker. By default, this command file is invoked in a subprocess and the image is linked. If /COMMAND is specified, the command file is written but not invoked. For validation, /COMMAND was used, and the generated command file was invoked after the ACS LINK command to do the actual link. This approach saves the overhead of spawning a subprocess for each executable validation test.
2. /NOTRACE was specified to exclude traceback symbol information from the image file since this information is only relevant when debugging programs.
3. /EXECUTABLE was used to specify the name of the executable image file.
4. For VAXELN targets only, /SYSTEM\_NAME=VAXELN was used.

The options and defaults for linking Ada programs are summarized below.

- o /COMMAND-file-name

Write a command file create the executable image using the VMS linker but do not invoke this commmand file.

- o /DEBUG or /NODEBUG

Controls whether a debugger symbol table is included in the executable image. The default is /NODEBUG.

- o /EXECUTABLE, /EXECUTABLE-file-name, or /NOEXECUTABLE

Controls whether the linker creates an executable image file and optionally provides the name of the file. The default is /EXECUTABLE.

- o /LOG or /NOLOG

Controls wheter a list of all units in the image is displayed. The default is /NOLOG.

- o /MAIN or /NOMAIN

Specifies whether the main Ada unit is the main program. The

default is /MAIN which indicates that the main Ada unit is the main program.

- o /MAP, /MAP-file-name, or /NOMAP

Controls whether the linker creates an image map listing file. The default is /NOMAP. If /MAP is specified, some other options can be specified to control the level of detail in the map listing file.

- o /OUTPUT-file-name

If specified, requests that output be written to a file other than to the standard output device.

- o /SYSLIB or /NOSYSLIB

Controls whether the linker automatically searches the default system library for unresolved references. By default, it is automatically searched.

- o /SYSSHR or /NOSYSSHR

Controls whether the linker automatically searches the default system shareable image library for unresolved references. By default, it is automatically searched.

- o /SYSTEM\_NAME-system

Directs the program library manager to produce an image for execution on a particular operating system. On VAX systems, the possible values are VAX\_VMS or VAXELN. On AXP systems, the only value supported is OpenVMS\_AXP.

If /SYSTEM\_NAME is not specified, the setting of the pragma SYSTEM\_NAME determines the target environment.

- o /TRACEBACK or /NOTRACEBACK

Controls whether subprogram traceback information is included in the executable image for run-time error reporting. The default is /TRACEBACK.

- o /USERLIBRARY=(table,...) or /NOUSERLIBRARY

Controls whether the linker searches any user-defined default libraries for unresolved external symbols. By default, the linker searches process, group, and system logical name tables for user-defined library definitions.

Additional options are provided that control whether the link is done while the user waits or is done in a background mode. Using one option or the other has no effect on the executable image that is generated.

## APPENDIX C

### APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in Chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of this Ada implementation, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this Appendix are to compiler documentation and not to this report. Implementation-specific portions of the package STANDARD, which are not a part of Appendix F, are:

package STANDARD is

type INTEGER is range -2147483648..2147483647;

type LONG\_INTEGER is range -2147483648..2147483647;

type SHORT\_INTEGER is range -32768..32768;

type SHORT\_SHORT\_INTEGER is range -128..127;

type FLOAT is digits 6 range -1.70141E+38..1.70141E+38;

type LONG\_FLOAT is digits 15 range  
-8.988465674312E+307..8.988465674312E+307;

type DURATION is delta 1.0E-4 range -131072.0..131071.9999;

end STANDARD;

# B

---

## Predefined Language Pragmas

- 1 This annex defines the pragmas LIST, PAGE, and OPTIMIZE, and summarizes the definitions given elsewhere of the remaining language-defined pragmas.

The DEC Ada pragmas IDENT and TITLE are also defined in this annex.

### Pragma

### Meaning

AST\_ENTRY

On VMS systems only.

Takes the simple name of a single entry as the single argument; at most one AST\_ENTRY pragma is allowed for any given entry. This pragma must be used in combination with the AST\_ENTRY attribute, and is only allowed after the entry declaration and in the same task type specification or single task as the entry to which it applies. This pragma specifies that the given entry may be used to handle a VMS asynchronous system trap (AST) resulting from a VMS system service call. The pragma does not affect normal use of the entry (see 9.12a).

COMMON\_OBJECT

Takes an internal name denoting an object, and optionally takes an external designator (the name of a linker storage area) and a size as arguments. This pragma is only allowed at the place of a declarative item, and must apply to a variable declared by an earlier declarative item of the same declarative part or

package specification. The variable must have a size that is known at compile time, and it must not require implicit initialization. This pragma is not allowed for objects declared with a renaming declaration. This pragma enables the shared use of objects that are stored in overlaid storage areas (see 13.9a.2.3).

#### COMPONENT\_ALIGNMENT

Takes an alignment choice and optionally the simple name of an array or record type as arguments. When no simple name is specified, the pragma must occur within a declarative part or package specification, and the effect of the pragma extends to types declared from the place of the pragma to the end of the innermost declarative part or package specification in which the pragma was declared. When a simple name is specified, the pragma and the type declaration must both occur immediately within the same declarative part, package specification, or task specification; the declaration must occur before the pragma. The position of the pragma and the restrictions on the named type are governed by the same rules as those for a representation clause. This pragma specifies the kind of alignment used for the components of the array or record types to which it applies (see 13.1a).

2

#### CONTROLLED

Takes the simple name of an access type as the single argument. This pragma is only allowed immediately within the declarative part or package specification that contains the declaration of the access type; the declaration must occur before the pragma. This pragma is not allowed for a derived type. This pragma specifies

that automatic storage reclamation must not be performed for objects designated by values of the access type, except upon leaving the innermost block statement, subprogram body, or task body that encloses the access type declaration, or after leaving the main program (see 4.8).

3      **ELABORATE**

Takes one or more simple names denoting library units as arguments. This pragma is only allowed immediately after the context clause of a compilation unit (before the subsequent library unit or secondary unit). Each argument must be the simple name of a library unit mentioned by the context clause. This pragma specifies that the corresponding library unit body must be elaborated before the given compilation unit. If the given compilation unit is a subunit, the library unit body must be elaborated before the body of the ancestor library unit of the subunit (see 10.5).

**EXPORT\_EXCEPTION**

On VMS systems only.

Takes an internal name denoting an exception, and optionally takes an external designator (the name of a linker global symbol), a form (ADA or VMS), and a code (a static integer expression that is interpreted as a condition code) as arguments. A code value must be specified when the form is VMS (the default if the form is not specified). This pragma is only allowed at the place of a declarative item, and must apply to an exception declared by an earlier declarative item of the same declarative part or package specification; it is not

allowed for an exception declared with a renaming declaration or for an exception declared in a generic unit. This pragma permits an Ada exception to be handled by programs written in another programming language (see 13.9a.3.2).

#### EXPORT\_FUNCTION

Takes an internal name denoting a function, and optionally takes an external designator (the name of a linker global symbol), parameter types, result type, parameter mechanisms, and result mechanism as arguments. This pragma is only allowed at the place of a declarative item, and must apply to a function declared by an earlier declarative item of the same declarative part or package specification. In the case of a function declared as a compilation unit, the pragma is only allowed after the function declaration and before any subsequent compilation unit. This pragma is not allowed for a function declared with a renaming declaration, and it is not allowed for a generic function (it may be given for a generic instantiation). This pragma permits an Ada function to be called from a program written in another programming language (see 13.9a.1.3).

#### EXPORT\_OBJECT

Takes an internal name denoting an object, and optionally takes an external designator (the name of a linker global symbol) and size option (a linker absolute global symbol that will be defined in the object module—useful on VMS systems only) as arguments. This pragma is only allowed at the place of a declarative item, and must apply to a constant or a variable declared by an earlier declarative

item of the same declarative part or package specification; the declaration must occur at the outermost level of a library package specification or body. The object to be exported must have a size that is known at compile time. This pragma is not allowed for objects declared with a renaming declaration, and is not allowed in a generic unit. This pragma permits an Ada object to be referred to by a routine written in another programming language (see 13.9a.2.2).

#### EXPORT\_PROCEDURE

Takes an internal name denoting a procedure, and optionally takes an external designator (the name of a linker global symbol), parameter types, and parameter mechanisms as arguments. This pragma is only allowed at the place of a declarative item, and must apply to a procedure declared by an earlier declarative item of the same declarative part or package specification. In the case of a procedure declared as a compilation unit, the pragma is only allowed after the procedure declaration and before any subsequent compilation unit. This pragma is not allowed for a procedure declared with a renaming declaration, and is not allowed for a generic procedure (it may be given for a generic instantiation). This pragma permits an Ada routine to be called from a program written in another programming language (see 13.9a.1.3).

**EXPORT\_VALUED\_PROCEDURE** Takes an internal name denoting a procedure, and optionally takes an external designator (the name of a linker global symbol), parameter types, and parameter mechanisms as arguments. This pragma is only

allowed at the place of a declarative item, and must apply to a procedure declared by an earlier declarative item of the same declarative part or package specification. In the case of a procedure declared as a compilation unit, the pragma is only allowed after the procedure declaration and before any subsequent compilation unit. The first (or only) parameter of the procedure must be of mode **out**. This pragma is not allowed for a procedure declared with a renaming declaration and is not allowed for a generic procedure (it may be given for a generic instantiation). This pragma permits an Ada procedure to behave as a function that both returns a value and causes side effects on its parameters when it is called from a routine written in another programming language (see 13.9a.1.3).

#### FLOAT\_REPRESENTATION

On VMS systems only.

On VMS VAX systems, takes **VAX\_FLOAT** as the single argument. On VMS AXP systems, takes either **VAX\_FLOAT** or **IEEE\_FLOAT** as the single argument; the default is **VAX\_FLOAT**. This pragma is only allowed at the start of a compilation, before the first compilation unit (if any) of the compilation. It specifies the choice of representation to be used for the predefined floating point types in the packages **SYSTEM** and **STANDARD**. (see 3.5.7a).

#### IDENT

Takes a string literal of 31 or fewer characters as the single argument. The pragma **IDENT** has the following form:

```
pragma IDENT (string_literal);
```

This pragma is allowed only in the outermost declarative part or declarative items of a compilation unit. The given string is used to identify the object module associated with the compilation unit in which the pragma IDENT occurs.

#### IMPORT\_EXCEPTION

On VMS systems only.

Takes an internal name denoting an exception, and optionally takes an external designator (the name of a linker global symbol), a form (ADA or VMS), and a code (a static integer expression that is interpreted as a condition code) as arguments. A code value is allowed only when the form is VMS (the default if the form is not specified). This pragma is only allowed at the place of a declarative item, and must apply to an exception declared by an earlier declarative item of the same declarative part or package specification; it is not allowed for an exception declared with a renaming declaration. This pragma permits a non-Ada exception (most notably, a VMS condition) to be handled by an Ada program (see 13.9a.3.1).

#### IMPORT\_FUNCTION

Takes an internal name denoting a function, and optionally takes an external designator (the name of a linker global symbol), parameter types, result type, parameter mechanisms, and result mechanism as arguments. On VMS systems, a first optional parameter is also available as an argument. The pragma INTERFACE must be used with this pragma (see 13.9). This pragma is only allowed at the place of a declarative item, and must apply to a function declared

by an earlier declarative item of the same declarative part or package specification. In the case of a function declared as a compilation unit, the pragma is only allowed after the function declaration and before any subsequent compilation unit. This pragma is allowed for a function declared with a renaming declaration; it is not allowed for a generic function or a generic function instantiation. This pragma permits a non-Ada routine to be used as an Ada function (see 13.9a.1.1).

#### IMPORT\_OBJECT

Takes an internal name denoting an object, and optionally takes an external designator (the name of a linker global symbol) and size (a linker absolute global symbol that will be defined in the object module—useful on VMS systems only) as arguments. This pragma is only allowed at the place of a declarative item, and must apply to a variable declared by an earlier declarative item of the same declarative part or package specification. The variable must have a size that is known at compile time, and it cannot have an initial value. This pragma is not allowed for objects declared with a renaming declaration. This pragma permits storage declared in a non-Ada routine to be referred to by an Ada program (see 13.9a.2.1).

#### IMPORT\_PROCEDURE

Takes an internal name denoting a procedure, and optionally takes an external designator (the name of a linker global symbol), parameter types, and parameter mechanisms as arguments. On VMS systems, a first optional parameter is also available as an argument. The pragma

**INTERFACE** must be used with this pragma (see 13.9). This pragma is only allowed at the place of a declarative item, and must apply to a procedure declared by an earlier declarative item of the same declarative part or package specification. In the case of a procedure declared as a compilation unit, the pragma is only allowed after the procedure declaration and before any subsequent compilation unit. This pragma is allowed for a procedure declared with a renaming declaration; it is not allowed for a generic procedure or a generic procedure instantiation. This pragma permits a non-Ada routine to be used as an Ada procedure (see 13.9a.1.1).

**IMPORT\_VALUED\_PROCEDURE** Takes an internal name denoting a procedure, and optionally takes an external designator (the name of a linker global symbol), parameter types, and parameter mechanisms as arguments. On VMS systems, a first optional parameter is also available as an argument. The pragma **INTERFACE** must be used with this pragma (see 13.9). This pragma is only allowed at the place of a declarative item, and must apply to a procedure declared by an earlier declarative item of the same declarative part or package specification. In the case of a procedure declared as a compilation unit, the pragma is only allowed after the procedure declaration and before any subsequent compilation unit. The first (or only) parameter of the procedure must be of mode **out**. This pragma is allowed for a procedure declared with a renaming declaration; it is not allowed for a generic procedure. This

pragma permits a non-Ada routine that returns a value and causes side effects on its parameters to be used as an Ada procedure (see 13.9a.1.1).

#### 4        **INLINE**

Takes one or more names as arguments; each name is either the name of a subprogram or the name of a generic subprogram. This pragma is only allowed at the place of a declarative item in a declarative part or package specification, or after a library unit in a compilation, but before any subsequent compilation unit. This pragma specifies that the subprogram bodies should be expanded inline at each call whenever possible; in the case of a generic subprogram, the pragma applies to calls of its instantiations (see 6.3.2).

#### **INLINE\_GENERIC**

Takes one or more names as arguments; each name is either the name of a generic declaration or the name of an instance of a generic declaration. This pragma is only allowed at the place of a declarative item in a declarative part or package specification, or after a library unit in a compilation, but before any subsequent compilation unit. Each argument must be the simple name of a generic subprogram or package, or a (nongeneric) subprogram or package that is an instance of a generic subprogram or package declared by an earlier declarative item of the same declarative part or package specification. This pragma specifies that inline expansion of the generic body is desired for each instantiation of the named generic declarations or of the particular named instances; the pragma does not apply to calls of

instances of generic subprograms  
(see 12.1a).

5 INTERFACE

Takes a language name and a subprogram name as arguments. This pragma is allowed at the place of a declarative item, and must apply in this case to a subprogram declared by an earlier declarative item of the same declarative part or package specification. This pragma is also allowed for a library unit; in this case the pragma must appear after the subprogram declaration, and before any subsequent compilation unit. This pragma specifies the other language (and thereby the calling conventions) and informs the compiler that an object module will be supplied for the corresponding subprogram (see 13.9).

In DEC Ada, the pragma INTERFACE is required in combination with the pragmas IMPORT\_FUNCTION, IMPORT\_PROCEDURE, and IMPORT\_VALUED\_PROCEDURE when any of those pragmas are used (see 13.9a.1).

INTERFACE\_NAME

Takes an internal name and an external name as arguments. The internal name may be an Ada simple name that denotes a subprogram or an object. If the declared entity is a function, the internal name may be a string literal that denotes an operator symbol. The external name may be any string literal; the literal is used as a linker global symbol that is associated with the external subprogram or object. This pragma is only allowed at the place of a declarative item, and must apply to an entity declared by an earlier declarative item of the

same declarative part or package specification.

If this pragma applies to a subprogram, then the pragma INTERFACE must also apply (see 13.9). If a subprogram has been declared as a compilation unit, the pragma is only allowed after the subprogram declaration and before any subsequent compilation unit. This pragma is allowed for subprograms declared with a renaming declaration. This pragma is not allowed for a generic subprogram or a generic subprogram instantiation.

If this pragma applies to an object, then the size of the object must be known at compile time. This pragma is not allowed for an the object declared with a renaming declaration.

This pragma associates an external symbol with the internal Ada name for a subprogram or object (see 13.9b).

6 LIST

Takes one of the identifiers ON or OFF as the single argument. This pragma is allowed anywhere a pragma is allowed. It specifies that listing of the compilation is to be continued or suspended until a LIST pragma with the opposite argument is given within the same compilation. The pragma itself is always listed if the compiler is producing a listing.

LONG\_FLOAT

On VMS systems only. Also, the value of the pragma FLOAT\_REPRESENTATION must be VAX\_FLOAT.

Takes either `D_FLOAT` or `G_FLOAT` as the single argument. The default is `G_FLOAT`. This pragma is only allowed at the start of a compilation, before the first compilation unit (if any) of the compilation. It specifies the choice of representation to be used for the predefined type `LONG_FLOAT` in the package `STANDARD`, and for floating point type declarations with `digits` specified in the range 7 .. 15 (see 3.5.7b).

#### `MAIN_STORAGE`

On VMS VAX systems only.

Takes one or two nonnegative static simple expressions of some integer type as arguments. This pragma is only allowed in the outermost declarative part of a library subprogram; at most one such pragma is allowed in a library subprogram. It has an effect only when the subprogram to which it applies is used as a main program. This pragma causes a fixed-size stack to be created for a main task (the task associated with a main program), and determines the number of storage units (bytes) to be allocated for the stack working storage area or guard pages or both. The value specified for either or both the working storage area and guard pages is rounded up to an integral number of pages. A value of zero for the working storage area results in the use of a default size; a value of zero for the guard pages results in no guard storage. A negative value for either working storage or guard pages causes the pragma to be ignored (see 13.2b).

7

#### `MEMORY_SIZE`

Takes a numeric literal as the single argument. This pragma is only allowed at the start of a compilation, before the

first compilation unit (if any) of the compilation. The effect of this pragma is to use the value of the specified numeric literal for the definition of the named number MEMORY\_SIZE (see 13.7).

8       OPTIMIZE

Takes one of the identifiers TIME or SPACE as the single argument. This pragma is only allowed within a declarative part and it applies to the block or body enclosing the declarative part. It specifies whether time or space is the primary optimization criterion.

In DEC Ada, this pragma is only allowed immediately within a declarative part of a body declaration.

9       PACK

Takes the simple name of a record or array type as the single argument. The allowed positions for this pragma, and the restrictions on the named type, are governed by the same rules as for a representation clause. The pragma specifies that storage minimization should be the main criterion when selecting the representation of the given type (see 13.1).

10       PAGE

This pragma has no argument, and is allowed anywhere a pragma is allowed. It specifies that the program text which follows the pragma should start on a new page (if the compiler is currently producing a listing).

11       PRIORITY

Takes a static expression of the predefined integer subtype PRIORITY, as the single argument. This pragma is only allowed within the specification of a task unit or immediately within the outermost declarative part of a main program. It specifies the priority of the

		task (or tasks of the task type) or the priority of the main program (see 9.8).
	<b>PSECT_OBJECT</b>	On VMS systems only.  Has the same syntax and the same effect as the pragma <b>COMMON_OBJECT</b> (see 13.9a.2.3).
12	<b>SHARED</b>	Takes the simple name of a variable as the single argument. This pragma is allowed only for a variable declared by an object declaration and whose type is a scalar or access type; the variable declaration and the pragma must both occur (in this order) immediately within the same declarative part or package specification. This pragma specifies that every read or update of the variable is a synchronization point for that variable. An implementation must restrict the objects for which this pragma is allowed to objects for which each of direct reading and direct updating is implemented as an indivisible operation (see 9.11).
	<b>SHARE_GENERIC</b>	On VMS systems only.  Takes one or more names as arguments; each name is either the name of a generic declaration or the name of an instance of a generic declaration. This pragma is only allowed at the place of a declarative item in a declarative part or package specification, or after a library unit in a compilation, but before any subsequent compilation unit. Each argument either must be the simple name of a generic subprogram or package, or it must be a (nongeneric) subprogram or package that is an instance of a generic subprogram or package. If the argument is an instance of a generic

subprogram or package, then it must be declared by an earlier declarative item of the same declarative part or package specification. This pragma specifies that generic code sharing is desired for each instantiation of the named generic declarations or of the particular named instances (see 12.1b).

13 STORAGE\_UNIT

Takes a numeric literal as the single argument. This pragma is only allowed at the start of a compilation, before the first compilation unit (if any) of the compilation. The effect of this pragma is to use the value of the specified numeric literal for the definition of the named number STORAGE\_UNIT (see 13.7).

In DEC Ada, the only argument allowed for this pragma is 8 (bits).

14 SUPPRESS

Takes as arguments the identifier of a check and optionally also the name of either an object, a type or subtype, a subprogram, a task unit, or a generic unit. This pragma is only allowed either immediately within a declarative part or immediately within a package specification. In the latter case, the only allowed form is with a name that denotes an entity (or several overloaded subprograms) declared immediately within the package specification. The permission to omit the given check extends from the place of the pragma to the end of the declarative region associated with the innermost enclosing block statement or program unit. For a pragma given in a package specification, the permission extends to the end of the scope of the named entity.

If the pragma includes a name, the permission to omit the given check is further restricted: it is given only for operations on the named object or on all objects of the base type of a named type or subtype; for calls of a named subprogram; for activations of tasks of the named task type; or for instantiations of the given generic unit (see 11.7).

SUPPRESS\_ALL

This pragma has no argument and is only allowed following a compilation unit. This pragma specifies that all run-time checks in the unit are suppressed (see 11.7).

15

SYSTEM\_NAME

Takes an enumeration literal as the single argument. This pragma is only allowed at the start of a compilation, before the first compilation unit (if any) of the compilation. The effect of this pragma is to use the enumeration literal with the specified identifier for the definition of the constant SYSTEM\_NAME. This pragma is only allowed if the specified identifier corresponds to one of the literals of the type NAME declared in the package SYSTEM (see 13.7).

TASK\_STORAGE

Takes the simple name of a task type and a static expression of some integer type as arguments. This pragma is allowed anywhere that a task storage specification is allowed; that is, the declaration of the task type to which the pragma applies and the pragma must both occur (in this order) immediately within the same declarative part, package specification, or task specification. The effect of this pragma is to use the value of the expression as the number of storage

units (bytes) to be allocated as guard storage. The value is rounded up to an appropriate boundary. A negative value causes the pragma to be ignored. A zero value has system-specific results: on VMS VAX systems, a value of zero results in no guard storage; on VMS AXP and ULTRIX systems, a value of zero results in a minimal guard area (see 13.2a).

#### TIME\_SLICE

On VMS systems only.

Takes a static expression of the predefined fixed point type DURATION (in the package STANDARD) as the single argument. This pragma is only allowed in the outermost declarative part of a library subprogram, and at most one such pragma is allowed in a library subprogram. It has an effect only when the subprogram to which it applies is used as a main program. This pragma causes the task scheduler to turn time slicing on or off and, on some systems, to limit the amount of continuous execution time given to a task

(see 9.8a; see also the appropriate run-time reference manual for implementation differences across systems).

#### TITLE

Takes a title or a subtitle string, or both, as arguments. The pragma TITLE has the following form:

```
pragma TITLE (titling-option
              [,titling-option]);

titling-option :=
    [TITLE =>] string_literal
  | [SUBTITLE =>] string_literal
```

This pragma is allowed anywhere a pragma is allowed; the given strings supersede the default title and/or subtitle portions of a compilation listing.

#### VOLATILE

Takes the simple name of a variable as the single argument. This pragma is only allowed for a variable declared by an object declaration. The variable declaration and the pragma must both occur (in this order) immediately within the same declarative part or package specification. The pragma must appear before any occurrence of the name of the variable other than in an address clause or in one of the DEC Ada pragmas `IMPORT_OBJECT`, `EXPORT_OBJECT`, `COMMON_OBJECT`, or `PSECT_OBJECT`. The variable cannot be declared by a renaming declaration. The pragma `VOLATILE` specifies that the variable may be modified asynchronously. This pragma instructs the compiler to obtain the value of a variable from memory each time it is used (see 9.11).

## Implementation-Dependent Characteristics

---

### Note

---

This appendix is not part of the standard definition of the Ada programming language.

---

This appendix summarizes the implementation-dependent characteristics of DEC Ada by presenting the following:

- Lists of the DEC Ada pragmas and attributes.
- The specifications of the package `SYSTEM`.
- The restrictions on representation clauses and unchecked type conversions.
- The conventions for names denoting implementation-dependent components in record representation clauses.
- The interpretation of expressions in address clauses.
- The implementation-dependent characteristics of the input-output packages.
- Other implementation-dependent characteristics.

See the relevant run-time reference manual for additional implementation-specific details.

### F.1 Implementation-Dependent Pragmas

DEC Ada provides the following pragmas, which are defined elsewhere in the text. In addition, DEC Ada restricts the predefined language pragmas `INLINE` and `INTERFACE`. See Annex B for a descriptive pragma summary.

<b>Pragma</b>	<b>DEC Ada systems on which it applies</b>	<b>Section</b>
AST_ENTRY	OpenVMS	9.12a
COMMON_OBJECT	All	13.9a.2.3
COMPONENT_ALIGNMENT	All	13.1a
EXPORT_EXCEPTION	OpenVMS	13.9a.3.2
EXPORT_FUNCTION	All	13.9a.1.3
EXPORT_OBJECT	All	13.9a.2.2
EXPORT_PROCEDURE	All	13.9a.1.3
EXPORT_VALUED_PROCEDURE	All	13.9a.1.3
FLOAT_REPRESENTATION	OpenVMS	3.5.7a
IDENT	All	Annex B
IMPORT_EXCEPTION	OpenVMS	13.9a.3.1
IMPORT_FUNCTION	All	13.9a.1.1
IMPORT_OBJECT	All	13.9a.2.1
IMPORT_PROCEDURE	All	13.9a.1.1
IMPORT_VALUED_PROCEDURE	All	13.9a.1.1
INLINE_GENERIC	All	12.1a
INTERFACE_NAME	All	13.9b
LONG_FLOAT	OpenVMS	3.5.7b
MAIN_STORAGE	OpenVMS VAX	13.2b
PSECT_OBJECT	OpenVMS	13.9a.2.3
SHARE_GENERIC	OpenVMS	12.1b
SUPPRESS_ALL	All	11.7
TASK_STORAGE	All	13.2a
TIME_SLICE	OpenVMS	9.8a
TITLE	All	Annex B
VOLATILE	All	9.11

## F.2 Implementation-Dependent Attributes

DEC Ada provides the following attributes, which are defined elsewhere in the text. See Annex A for a descriptive attribute summary.

Attribute	DEC Ada systems on which it applies	Section
AST_ENTRY	OpenVMS	9.12a
BIT	All	13.7.2
MACHINE_SIZE	All	13.7.2
NULL_PARAMETER	All	13.9a.1.2
TYPE_CLASS	All	13.7a.2

## F.3 Specification of the Package System

DEC Ada provides a system-specific version of the package SYSTEM for each system on which it is supported. The individual package SYSTEM specifications appear in the following sections.

### F.3.1 The Package System on OpenVMS VAX Systems

package SYSTEM is

```

type NAME is
  -- DEC Ada implementations
  (VAX_VMS, VAXELN, OpenVMS_AXP, RISC_ULTRIX,
  -- XD Ada implementations
  MIL_STD_1750A, MC68000, MC68020, MC68040, CPU32);
for NAME use (1, 2, 7, 8, 101, 102, 103, 104, 105);

## F.4 Restrictions on Representation Clauses

The representation clauses allowed in DEC Ada are length, enumeration, record representation, and address clauses.

In DEC Ada, a representation clause for a generic formal type or a type that depends on a generic formal type is not allowed. In addition, a representation clause for a composite type that has a component or subcomponent of a generic formal type or a type derived from a generic formal type is not allowed.

## F.5 Restrictions on Unchecked Type Conversions

DEC Ada supports the generic function `UNCHECKED_CONVERSION` with the following restrictions on the class of types involved:

- The actual subtype corresponding to the formal type `TARGET` must not be an unconstrained array type.
- The actual subtype corresponding to the formal type `TARGET` must not be an unconstrained type with discriminants.

Further, when the target type is a type with discriminants, the value resulting from a call of the conversion function resulting from an instantiation of `UNCHECKED_CONVERSION` is checked to ensure that the discriminants satisfy the constraints of the actual subtype.

If the size of the source value is greater than the size of the target subtype, then the high order bits of the value are ignored (truncated); if the size of the source value is less than the size of the target subtype, then the value is extended with zero bits to form the result value.

## **F.6 Conventions for Implementation-Generated Names Denoting Implementation-Dependent Components in Record Representation Clauses**

DEC Ada does not allocate implementation-dependent components in records.

## **F.7 Interpretation of Expressions Appearing in Address Clauses**

Expressions appearing in address clauses must be of the type ADDRESS defined in the package SYSTEM (see 13.7a.1 and F.3). In DEC Ada, values of type SYSTEM.ADDRESS are interpreted as virtual addresses in the machine's address space.

DEC Ada allows address clauses for objects and imported subprograms (see 13.5).

DEC Ada does not support interrupts as defined in section 13.5.1.

On OpenVMS systems, DEC Ada provides the pragma *AST\_ENTRY* and the *AST\_ENTRY* attribute as alternative mechanisms for handling asynchronous interrupts from the OpenVMS operating system (see 9.12a).

For information on handling ULTRIX signals, see the *DEC Ada Run-Time Reference Manual for ULTRIX Systems*.

## **F.8 Implementation-Dependent Characteristics of Input-Output Packages**

In addition to the standard predefined input-output packages (SEQUENTIAL\_IO, DIRECT\_IO, TEXT\_IO, and IO\_EXCEPTIONS), DEC Ada provides packages for handling sequential and direct files with mixed-type elements:

- SEQUENTIAL\_MIXED\_IO (see 14.2b.4).
- DIRECT\_MIXED\_IO (see 14.2b.6).

DEC Ada does not provide the low level input-output package described in this section.

As specified in section 14.4, DEC Ada raises the following language-defined exceptions for error conditions that occur during input-output operations: `STATUS_ERROR`, `MODE_ERROR`, `NAME_ERROR`, `USE_ERROR`, `END_ERROR`, `DATA_ERROR`, and `LAYOUT_ERROR`. DEC Ada does not raise the language-defined exception `DEVICE_ERROR`; device-related errors cause the exception `USE_ERROR` to be raised.

The exception `USE_ERROR` is raised under the following conditions:

- If the capacity of the external file has been exceeded.
- In all `CREATE` operations if the mode specified is `IN_FILE`.
- In all `CREATE` operations if the file attributes specified by the `FORM` parameter are not supported by the package.
- In all `CREATE`, `OPEN`, `DELETE`, and `RESET` operations if, for the specified mode, the environment does not support the operation for an external file.
- In all `NAME` operations if the file has no name.
- In the `SET_LINE_LENGTH` and `SET_PAGE_LENGTH` operations on text files if the lengths specified are inappropriate for the external file.
- In text files if an operation is attempted that is not possible for reasons that depend on characteristics of the external file.

DEC Ada provides other input-output packages that are available on specific systems. The following sections outline those packages. The following sections also give system-specific information about the overall set of DEC Ada input-output packages and input-output exceptions.

### **F.8.1 DEC Ada Input-Output Packages on OpenVMS Systems**

On OpenVMS systems, the DEC Ada predefined packages and their operations are implemented using OpenVMS Record Management Services (RMS) file organizations and facilities. To give users the maximum benefit of the underlying RMS input-output facilities, DEC Ada provides the following OpenVMS-specific packages:

- `RELATIVE_IO` (see 14.2a.3).
- `INDEXED_IO` (see 14.2a.5).
- `RELATIVE_MIXED_IO` (see 14.2b.8).
- `INDEXED_MIXED_IO` (see 14.2b.10).
- `AUX_IO_EXCEPTIONS` (see 14.5a).

The following sections summarize the implementation-dependent characteristics of the DEC Ada input-output packages. The *DEC Ada Run-Time Reference Manual for OpenVMS Systems* discusses these characteristics in more detail.

#### F.8.1.1 Interpretation of the FORM Parameter on OpenVMS Systems

On OpenVMS systems, the value of the FORM parameter may be a string of statements of the OpenVMS Record Management Services (RMS) File Definition Language (FDL), or it may be a string referring to a text file of FDL statements (called an FDL file).

FDL is a special-purpose OpenVMS language for writing file specifications. These specifications are then used by DEC Ada run-time routines to create or open files. See the *DEC Ada Run-Time Reference Manual for OpenVMS Systems* for the rules governing the FORM parameter and for a general description of FDL. See the *Guide to OpenVMS File Applications* and the *OpenVMS Record Management Utilities Reference Manual* for complete information on FDL.

On OpenVMS systems, each input-output package has a default string of FDL statements that is used to open or create a file. Thus, in general, specification of a FORM parameter is not necessary: it is never necessary in an OPEN procedure; it may be necessary in a CREATE procedure. The packages for which a value for the FORM parameter must be specified in a CREATE procedure are as follows:

- The packages DIRECT\_IO and RELATIVE\_IO require that a maximum element (record) size be specified in the FORM parameter if the item with which the package is instantiated is unconstrained.
- The packages DIRECT\_MIXED\_IO and RELATIVE\_MIXED\_IO require that a maximum element (record) size be specified in the FORM parameter.
- The packages INDEXED\_IO and INDEXED\_MIXED\_IO require that information about keys be specified in the FORM parameter.

Any explicit FORM specification supersedes the default attributes of the governing input-output package. The *DEC Ada Run-Time Reference Manual for OpenVMS Systems* describes the default external file attributes of each input-output package.

The use of the FORM parameter is described for each input-output package in chapter 14. For information on the default FORM parameters for each DEC Ada input-output package and for information on using the FORM parameter to specify external file attributes, see the *DEC Ada Run-Time Reference Manual for OpenVMS Systems*. For information on FDL, see the *Guide to OpenVMS File Applications* and the *OpenVMS Record Management Utilities Reference Manual*.

### F.8.1.2 Input-Output Exceptions on OpenVMS Systems

In addition to the DEC Ada exceptions that apply on all systems, the following also apply on OpenVMS systems:

- The DEC Ada exceptions `LOCK_ERROR`, `EXISTENCE_ERROR`, and `KEY_ERROR` are raised for relative and indexed input-output operations.
- The exception `USE_ERROR` is raised as follows in relative and indexed files:
  - In the `WRITE` operations on relative or indexed files if the element in the position indicated has already been written.
  - In the `DELETE_ELEMENT` operations on relative and indexed files if the current element is undefined at the start of the operation.
  - In the `UPDATE` operations on indexed files if the current element is undefined or if the specified key violates the external file attributes.
- The exception `NAME_ERROR` is raised as specified in section 14.4: by a call of a `CREATE` or `OPEN` procedure if the string given for the `NAME` parameter does not allow the identification of an external file. On OpenVMS systems, the value of a `NAME` parameter can be a string that denotes a OpenVMS file specification or a OpenVMS logical name (in either case, the string names an external file). For a `CREATE` procedure, the value of a `NAME` parameter can also be a null string, in which case it names a temporary external file that is deleted when the main program exits. The *DEC Ada Run-Time Reference Manual for OpenVMS Systems* explains the naming of external files in more detail.
- The exception `LAYOUT_ERROR` is raised as specified in section 14.4: in text input-output by `COL`, `LINE`, or `PAGE` if the value returned exceeds `COUNT·LAST`. The exception `LAYOUT_ERROR` is also raised on output by an attempt to set column or line numbers in excess of specified maximum line or page lengths, and by attempts to `PUT` too many characters to a string. In the DEC Ada mixed input-output packages, the exception `LAYOUT_ERROR` is raised by `GET_ITEM` if no more items can be read from the file buffer; it is raised by `PUT_ITEM` if the current position exceeds the file buffer size.

## F.8.2 Input-Output Packages on ULTRIX Systems

On ULTRIX systems, the DEC Ada predefined packages and their operations are implemented using ULTRIX file facilities. DEC Ada provides no additional input-output packages specifically related to ULTRIX systems.

The following sections summarize the ULTRIX-specific characteristics of the DEC Ada input-output packages. The *DEC Ada Run-Time Reference Manual for ULTRIX Systems* discusses these characteristics in more detail.

### F.8.2.1 Interpretation of the FORM Parameter on ULTRIX Systems

On ULTRIX systems, the value of the FORM parameter must be a character string, defined as follows:

```
string      ::= "[field (,field)]"  
field       ::= field_id => field_value  
field_id    ::= BUFFER_SIZE | ELEMENT_SIZE | FILE_DESCRIPTOR  
field_value ::= digit (digit)
```

Depending on the fields specified, the value of the FORM parameter may represent one or more of the following:

- The size of the buffer used during file operations. The field value specifies the number of bytes in the buffer.
- The maximum element size for a direct file. The field value specifies the maximum number of bytes in the element.
- An ULTRIX file descriptor for the Ada file being opened. The ULTRIX file descriptor must be open.

If the file descriptor is not open, or if it refers to an Ada file that is already open, then the exception `USE_ERROR` is raised. Note that the file descriptor option can be used only in the FORM parameter of an `OPEN` procedure.

Each input-output package has an implementation-defined value form string that is used to open or create a file. Thus, in general, specification of a FORM parameter is not necessary. The packages for which a value for the FORM parameter must be specified in a `CREATE` procedure are as follows:

- The package `DIRECT_IO` requires that a maximum element size be specified in the FORM parameter if the item with which the package is instantiated is unconstrained.
- The package `DIRECT_MIXED_IO` requires that a maximum element size be specified in the FORM parameter.

The use of the `FORM` parameter is described for each input-output package in chapter 14. For information on using the `FORM` parameter to specify external file attributes, see the *DEC Ada Run-Time Reference Manual for ULTRIX Systems*.

### F.8.2.2 Input-Output Exceptions on ULTRIX Systems

In addition to the DEC Ada exceptions that apply on all systems, the following also apply on ULTRIX systems:

- The exception `NAME_ERROR` is raised as specified in section 14.4: by a call of a `CREATE` or `OPEN` procedure if the string given for the `NAME` parameter does not allow the identification of an external file. On ULTRIX systems, the value of a `NAME` parameter can be a string that denotes an ULTRIX file specification. For a `CREATE` procedure, the value of a `NAME` parameter can also be a null string, in which case it names a temporary external file that is deleted when the main program exits. The *DEC Ada Run-Time Reference Manual for ULTRIX Systems* explains the naming of external files in more detail.
- The exception `LAYOUT_ERROR` is raised as specified in section 14.4: in text input-output by `COL`, `LINE`, or `PAGE` if the value returned exceeds `COUNT·LAST`. The exception `LAYOUT_ERROR` is also raised on output by an attempt to set column or line numbers in excess of specified maximum line or page lengths, and by attempts to `PUT` too many characters to a string. In the DEC Ada mixed input-output packages, the exception `LAYOUT_ERROR` is raised by `GET_ITEM` if no more items can be read from the file buffer; it is raised by `PUT_ITEM` if the current position exceeds the file buffer size.

## F.9 Other Implementation Characteristics

Implementation characteristics relating to the definition of a main program, various numeric ranges, and implementation limits are summarized in the following sections.

### F.9.1 Definition of a Main Program

DEC Ada permits a library unit to be used as a main program under the following conditions:

- If it is a procedure with no formal parameters.
  - On OpenVMS systems, the status returned to the OpenVMS environment upon normal completion of the procedure is the value 1.
  - On ULTRIX systems, the status returned to the ULTRIX environment upon normal completion of the procedure is the value 0.

- If it is a function with no formal parameters whose returned value is of a discrete type. In this case, the status returned to the operating-system environment upon normal completion of the function is the function value.
- If it is a procedure declared with the pragma `EXPORT_VALUED_PROCEDURE`, and it has one formal `out` parameter that is of a discrete type. In this case, the status returned to the operating-system environment upon normal completion of the procedure is the value of the first (and only) parameter.

Note that when a main function or a main procedure declared with the pragma `EXPORT_VALUED_PROCEDURE` returns a discrete value whose size is less than 32 bits, the value is zero- or sign-extended as appropriate.

## F.9.2 Values of Integer Attributes

The ranges of values for integer types declared in the package `STANDARD` are as follows:

Integer type	Range	Systems on which it applies
<code>SHORT_SHORT_INTEGER</code>	-128 .. 127	All
<code>SHORT_INTEGER</code>	-32768 .. 32767	All
<code>INTEGER</code>	-2147483648 .. 2147483647	All
<code>LONG_INTEGER</code>	-2147483648 .. 2147483647	OpenVMS

For the applicable input-output packages, the ranges of values for the types COUNT and POSITIVE\_COUNT are as follows:

COUNT                    0 .. INTEGER' LAST  
 POSITIVE\_COUNT        1 .. INTEGER' LAST

For the package TEXT\_IO, the range of values for the type FIELD is as follows:

FIELD                    0 .. INTEGER' LAST

### F.9.3 Values of Floating Point Attributes

DEC Ada provides a number of predefined floating point types, as shown in the following table:

Type	Representation	Systems on which it applies	Section
FLOAT	F_floating IEEE single float	All OpenVMS <sup>1</sup> ULTRIX, OpenVMS AXP <sup>2</sup>	3.5.7
LONG_FLOAT	D_floating or G_floating IEEE double float	All OpenVMS <sup>1</sup> ULTRIX, OpenVMS AXP <sup>2</sup>	3.5.7
LONG_LONG_FLOAT	H_floating	OpenVMS VAX	3.5.7
F_FLOAT	F_floating	All OpenVMS	3.5.7
D_FLOAT	D_floating	All OpenVMS	3.5.7
G_FLOAT	G_floating	All OpenVMS	3.5.7
H_FLOAT	H_floating	OpenVMS VAX	3.5.7
IEEE_SINGLE_FLOAT	IEEE single float	ULTRIX, OpenVMS AXP <sup>2</sup>	3.5.7
IEEE_DOUBLE_FLOAT	IEEE double float	ULTRIX, OpenVMS AXP <sup>2</sup>	3.5.7

<sup>1</sup>When the value of the pragma FLOAT\_REPRESENTATION is VAX\_FLOAT.

<sup>2</sup>When the value of the pragma FLOAT\_REPRESENTATION is IEEE\_FLOAT.

The values of the floating point attributes for the different floating point representations appear in the following tables.

### F.9.3.1 F\_floating Characteristics

Attribute	F_floating value and approximate decimal equivalent (where applicable)
DIGITS	6
MANTISSA	21
EMAX	84
EPSILON	16#0.1000_000#e-4
approximately	9.53674E-07
SMALL	16#0.8000_000#e-21
approximately	2.58494E-26
LARGE	16#0.FFFF_FF80#e+21
approximately	1.93428E+25
SAFE_EMAX	127
SAFE_SMALL	16#0.1000_000#e-31
approximately	2.93874E-39
SAFE_LARGE	16#0.7FFF_FC0#e+32
approximately	1.70141E+38
FIRST	-16#0.7FFF_FF8#e+32
approximately	-1.70141E+38
LAST	16#0.7FFF_FF8#e+32
approximately	1.70141E+38
MACHINE_RADIX	2
MACHINE_MANTISSA	24
MACHINE_EMAX	127
MACHINE_EMIN	-127
MACHINE_ROUNDS	True
MACHINE_OVERFLOWS	True

### F.9.3.2 D\_floating Characteristics

Attribute	D_floating value and approximate decimal equivalent (where applicable)
DIGITS	9
MANTISSA	31
EMAX	124
EPSILON approximately	16#0.4000_0000_0000_000#e-7 9.3132257461548E-10
SMALL approximately	16#0.8000_0000_0000_000#e-31 2.3509887016446E-38
LARGE approximately	16#0.FFFF_FFFE_0000_000#e+31 2.1267647922655E+37
SAFE_EMAX	127
SAFE_SMALL approximately	16#0.1000_0000_0000_000#e-31 2.9387358770557E-39
SAFE_LARGE approximately	16#0.7FFF_FFFF_0000_000#e+32 1.7014118338124E+38
FIRST approximately	-16#0.7FFF_FFFF_FFFF_FF8#e+32 -1.7014118346047E+38
LAST approximately	16#0.7FFF_FFFF_FFFF_FF8#e+32 1.7014118346047E+38
MACHINE_RADIX	2
MACHINE_MANTISSA	56
MACHINE_EMAX	127
MACHINE_EMIN	-127
MACHINE_ROUNDS	True
MACHINE_OVERFLOWS	True

### F.9.3.3 G\_floating Characteristics

Attribute	G_floating value and approximate decimal equivalent (where applicable)
DIGITS	15
MANTISSA	51
EMAX	204
EPSILON approximately	16#0.4000_0000_0000_00#e-12 8.881784197001E-16
SMALL approximately	16#0.8000_0000_0000_00#e-51 1.944692274332E-62
LARGE approximately	16#0.FFFF_FFFF_FFFF_E0#e+51 2.571100870814E+61
SAFE_EMAX	1023
SAFE_SMALL approximately	16#0.1000_0000_0000_00#e-255 5.562684646268E-309
SAFE_LARGE approximately	16#0.7FFF_FFFF_FFFF_F0#e+256 8.988465674312E+307
FIRST approximately	-16#0.7FFF_FFFF_FFFF_FC#e+256 -8.988465674312E+307
LAST approximately	16#0.7FFF_FFFF_FFFF_FC#e+256 8.988465674312E+307
MACHINE_RADIX	2
MACHINE_MANTISSA	53
MACHINE_EMAX	1023
MACHINE_EMIN	-1023
MACHINE_ROUNDS	True
MACHINE_OVERFLOWS	True

### F.9.3.4 H\_floating Characteristics

Attribute	H_floating value and approximate decimal equivalent (where applicable)
DIGITS	33
MANTISSA	111
EMAX	444
EPSILON approximately	16#0.4000_0000_0000_0000_0000_0000_0000_0#e-27 7.7037197775489434122239117703397E-34
SMALL approximately	16#0.8000_0000_0000_0000_0000_0000_0000_0#e-111 1.1006568214637918210934318020936E-134
LARGE approximately	16#0.FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_0#e+111 4.5427420268475430659332737993000E+133
SAFE_EMAX	16383
SAFE_SMALL approximately	16#0.1000_0000_0000_0000_0000_0000_0000_0#e-4095 8.4052578577802337656566945433044E-4933
SAFE_LARGE approximately	16#0.7FFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_0#e+4096 5.9486574767861588254287966331400E+4931
FIRST approximately	-16#0.7FFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_C#e+4096 -5.9486574767861588254287966331400E+4931
LAST approximately	16#0.7FFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_C#e+4096 5.9486574767861588254287966331400E+4931
MACHINE_RADIX	2
MACHINE_MANTISSA	113
MACHINE_EMAX	16383
MACHINE_EMIN	-16383
MACHINE_ROUNDS	True
MACHINE_OVERFLOWS	True

### F.9.3.5 IEEE Single Float Characteristics

Attribute	IEEE single float value and approximate decimal equivalent (where applicable)
DIGITS	6
MANTISSA	21
EMAX	84
EPSILON approximately	16#0.1000_000#e-4 9.53674E-07
SMALL approximately	16#0.8000_000#e-21 2.5849E-26
LARGE approximately	16#0.FFFF_F80#E+21 1.93428E+25
SAFE_EMAX	125
SAFE_SMALL approximately	1.17549E-38
SAFE_LARGE approximately	4.25353E+37
FIRST approximately	-3.40282E+38
LAST approximately	3.40282E+38
MACHINE_RADIX	2
MACHINE_MANTISSA	24
MACHINE_EMAX	128
MACHINE_EMIN	-125
MACHINE_ROUNDS	True
MACHINE_OVERFLOWS	True

### F.9.3.6 IEEE Double Float Characteristics

Attribute	IEEE double float value and approximate decimal equivalent (where applicable)
DIGITS	15
MANTISSA	51
EMAX	204
EPSILON	
approximately	8.8817841970012E-16
SMALL	
approximately	1.9446922743316E-62
LARGE	
approximately	2.5711008708144E+61
SAFE_EMAX	1021
SAFE_SMALL	
approximately	2.22507385850720E-308
SAFE_LARGE	
approximately	2.2471164185779E+307
FIRST	
approximately	-1.7976931348623E+308
LAST	
approximately	1.7976931348623E+308
MACHINE_RADIX	2
MACHINE_MANTISSA	53
MACHINE_EMAX	1024
MACHINE_EMIN	-1021
MACHINE_ROUNDS	True
MACHINE_OVERFLOWS	True

### F.9.4 Attributes of Type DURATION

The values of the significant attributes of the type DURATION are as follows:

DURATION' DELTA	0.0001
DURATION' SMALL	2 <sup>-14</sup>
DURATION' FIRST	-131072.0000

DURATION·LAST 131071.9999  
 DURATION·LARGE 131071.9999

### F.9.5 Implementation Limits

Limit	DEC systems on which it applies	Value
Maximum number of formal parameters in a subprogram or entry declaration that are of an unconstrained record type	All	32
Maximum identifier length (number of characters)	All	255
Maximum number of characters in a source line	All	255
Maximum number of discriminants for a record type	All	245
Maximum number of formal parameters in an entry or subprogram declaration	All	246
Maximum number of dimensions in an array type	All	255
Maximum number of library units and subunits in a compilation closure <sup>1</sup>	All	4095
Maximum number of library units and subunits in an execution closure <sup>2</sup>	All	16383
Maximum number of objects declared with the pragma COMMON_OBJECT or PSECT_OBJECT	All	32757
Maximum number of enumeration literals in an enumeration type definition	All	65535
Maximum number of lines in a source file	All	65534
Maximum number of bits in any object	All	$2^{31} - 1$
Maximum size of the static portion of a stack frame (approximate)	All	$2^{30}$

<sup>1</sup>The compilation closure of a given unit is the total set of units that the given unit depends on, directly and indirectly.

<sup>2</sup>The execution closure of a given unit is the compilation closure plus all associated secondary units (library bodies and subunits).
