MEMORANDUM FOR PHILLIPS LABORATORY/PKVA
ATTN: Ms Lynne Adams

SUBJECT: Approval for Unlimited Distribution Constructing a
Reference Event List of FINESA Report C93-07
Contract No. F29601-92-C-0005

ARPA/NMRO has carefully reviewed the subject scientific report submitted by Science Applications International Corporation under the subject contract, and certifies that this report contains no critical or sensitive data, information, or technology. As a result of this investigation, the report is approved for public release, distribution unlimited.

The contractor shall include a copy of this letter with each copy of the subject report released to individuals or organizations outside of the US Government or their contractors, as documentation that the contents have been reviewed and that unlimited distribution of the report has been approved.

The procedure described above is consistent with the distribution procedures specified in the subject contract, and with procedures agreed upon in our phone conversation of 8 July 1993. Please let me know if you have any questions.

13. ABSTRACT (Maximum 200 words) The method described in a previous report (C93-03) has been applied to a large data set of events recorded at FINESA. Groups of similar events have been defined and compared to mine locations when available. The Helsinki bulletin reported a large number of the studied events. When it was possible, the bulletin reported the mine of origin of the events which allowed us to test the consistency of our method.

1. INTRODUCTION

This report is the third of a series presenting the results of a study using recordings of events from Scandinavia in order to construct a list of reference events for each of the Scandinavian arrays. The first report (Rivière-Barbier, 1993a) gives a thorough description of the procedure followed to define these reference events and presents the results for the ARCESS array. The second report (Rivière-Barbier, 1993b) presents the results for the NORESS array, and the third report, for the FINESA array.

The results presented in this report were obtained using data recorded at the FINESA array. Figure 26 shows a map of Scandinavia on which were superimposed the different areas that were studied independently. Twenty-four areas were studied using FINESA data: areas 28, 29, 30, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 54, 55, 56, 57, 58, 59, 60, 61 and 62.

Recordings on the vertical channel (sz) of the element FIA1 were used in the waveform comparison process. General information and the results of the processing are presented for each area in Appendix 1. Processing parameters are listed in Appendix 2. Lists of the mine locations from several sources, already provided in both previous reports, are given in Appendix 3.

2. AREA DESCRIPTION

The parameters used to characterize the areas are given below.

2.1. *Latitude*

Upper and lower latitude limits of the studied area are given in this field. For the part of Scandinavia described in this report, the lowest latitude is 56 degrees and the highest latitude is 66 degrees. Area sizes in latitude are 2 degrees. All latitudes given in this report are North of the Equator.

2.2. *Longitude*

Upper and lower longitude limits of the studied area are given in this field. For the part of Scandinavia described in this report, the smallest longitude is 18 degrees and the largest longitude is 38 degrees. Area sizes in longitude can vary from 1.0 degree to 6.0 degrees. Longitudes given in this report are East of the Greenwich meridian.

2.3. *Number of events in IMS2*

This is the number of events located within a particular area by the IMS and stored in the IMS2 database account at the time of the selection, January 16, 1993. At that time, the database contained events that occurred between November 1990 and January 12, 1993.

Figure 26: Map of Scandinavia showing the 64 areas that are being used to define a list of reference events for each array NORESS, ARCESS and FINESA. The arrays are represented by their central element: NRA0, ARA0, FIA0.

2.4. Local magnitude range

The local magnitude range is used to select the events from a particular area. The range is used to obtain a representative data set of the area. The events were selected based on decreasing magnitude in order to get the largest events. When no magnitude range is given, all events located in the area were used in the processing. This happened when too few large events were available for a given area.

2.5. Number of events within the magnitude range

This number is either equal to or lower than the number of events in the IMS database. Not all events located by the IMS and whose locations are stored in the database have waveforms. Technical problems at the array, software and hardware failures, and misidentification by the expert system can lead to lost of waveforms.

2.6. Number of processed events

The number of processed events is, in most cases, smaller than the *number of events within the magnitude range*. A specific length of signal is required for the computation, and the waveform segment available on disk may not be long enough. Also, an event recording can be made of two waveform segments, a case that is not handled by the processing program.

2.7. Frequency range used to process the data

For each area, a frequency range is defined to filter the data. The high frequency corner is always set to 16.0 Hz. The low frequency corner varies from 1.0 to 3.0 Hz.

2.8. Processed signal length

The signal length needed for processing should include all phases and therefore, is distance dependent. The signal length is defined to contain the beginning of the first phase and the end of the last phase associated with the event. The total length includes the signal plus 1/8 of the signal length at each end since a 10% cosine taper is applied to the data.

2.9. Number of reference events

This gives the number of events that need to be used to identify most of the events located within a given area. The table listing these reference events gives the following information:

- the event number: related to the processing;
- the IMS orid: IMS event number in the database;
- the IMS arid: IMS number for the first phase associated with the event at the array;
- the IMS wfid: IMS waveform number, in this study only waveforms recorded on the vertical channel (sz) of the element FIA1 of the array were used;
- the threshold: lowest cross-correlation value between a given reference event characterizing a group and any event in this particular group. Below this value,

events do not belong to the group represented by the reference event. When a reference event is defined for a group of only two events, no threshold value is given.

- the group: corresponds to the event classification using the cluster analysis method.

2.10. Reported mine locations

Scandinavia has a very large and important mining industry. The vast majority of the events recorded in the area are related to the mining activity either directly as mine blasts or indirectly like as induced events (tremors). In Appendix 3, lists of the different mine locations are given. These lists have four main sources: SPOT photos, the bulletin published by the University of Helsinki, the Norwegian bulletin, and Joint Operations Graphic (JOG) maps from the American Defense Mapping Agency. The mine locations found on SPOT photos are the most reliable locations but the SPOT photos available cover only a small part of the studied area. The locations provided in the Helsinki bulletin have recently been updated based on SPOT locations and on information that the Finnish researchers have obtained directly from the mines. Based on these new locations, the Helsinki mine labelling changed after May 1991. This list is probably the most complete list for Scandinavia despite the fact that some large mines located outside of Finnish territory are missing. An attempt was made to map the old Helsinki mine labels with the new labels. This mapping is shown in the table giving the new Helsinki mine locations. The Norwegian bulletin gives a list of accurate mine locations located mostly in Norway. The JOG maps give accurate mine locations but they are not recent enough: some new mines may be missing and old mines may not be active any more. For each area, a table gives:

- the label: symbol used on the IMS maps,
- the location: latitude and longitude,
- the source of information.

2.11. Number of events found in the Helsinki bulletin

The bulletin published by the University of Helsinki provided extensive lists of events occurring in Scandinavia. Most of the mining events reported in this bulletin have a "manual location" which means that the Finnish analysts visually assigned these events to a particular mine. However, for this particular area, only events with an automatic location have been reported.

A software was used to match the events reported in the Helsinki bulletin with the studied events applying the following parameters:

- the distance between associated events should not be more than 1°,
- the difference in origin time should not be more than 20 seconds.

One-thousand-six events from the Helsinki bulletin were associated with an event from the IMS database. Five-hundred-thirty-one had "manual locations" and the remain-

ing four-hundred-seventy-five events had "automatic locations".

For each area, a table listing the studied events that were found in the Helsinki bulletin based on the criteria described above gives:

- the event number: this number is related to the processing,
- the event orid: number identifying the event in the IMS database,
- the origin time: from the IMS origin table,
- the local magnitude: from the IMS origin table,
- the Helsinki location: either a latitude and longitude if the event was located automatically or a mine label if the event was located manually,
- the Helsinki identification:

if the event was located manually, the label 'EXP' (for explosion) is used;

if the event was identified as being a quarry blast, the label 'QB' is used;

if the event was identified as being a probable quarry blast, the label 'P.QB' is used;

if the event was identified as being a local earthquake, the label 'LB' was used;

if the event was identified as being a regional distance event, the label 'R' was used;

if the event was identified as being an earthquake, the label 'EARTH' is used;

if the event was identified as being probably an earthquake, the label 'P.E.' is used.

When the event was not identified in the Helsinki bulletin, no label is shown. The labels QB, P.QB, LB and R were used during the GSETT experiment only.

- the group: corresponds to the event classification using the cluster analysis method.

2.12. Events with the most reliable classification

For each area, events were sorted into groups based on their waveform similarities. A table gives the list of the events included in each group. Events with a too low signal-to-noise ratio and events that were mixed with other events on the same waveform (except when these events were very large and when they all belonged to the same group) were not included in this list. The table includes the following information:

- the event number: this number is related to the processing,
- the event orid: number identifying the event in the IMS database,
- the origin time: from the IMS origin table,
- the location: from the IMS origin table,
- the local magnitude: from the IMS origin table,
- the group: corresponds to the event classification using the cluster analysis method.

2.13. Remarks

For each area, comments are made about the events and their classification. Comparisons are made between mine locations and event locations. Any particular features seen on the data are reported.

2.14. Mine and event locations

A map showing the IMS event locations and the mine locations from the Norwegian bulletin, the Helsinki bulletin and the JOG maps are plotted for each area. This map allows the comparison between the different sets of mine locations mentioned above as well as the comparison between the event locations and the mine locations.

3. CONCLUSION

One-thousand-eight-hundred-forty-six events were processed during this study. Two-hundred-twenty-five reference events have been defined to represent the event types recorded at FINESA for distances between 0 and 7.5 degrees. Some of the reference events may be redundant when groups of events overlap boundaries between areas. Among the studied event, one-thousand-one-hundred-forty-seven events were reliably associated with a reference event

Among the studied events, one-thousand-six were found in the Helsinki bulletin including five-hundred-eighty-two events with 'manual locations', nineteen events identified as being 'quarry blasts', one event identified as being a 'probable quarry blast', five events were identified as 'local blasts', two events were identified as 'regional events', two events were identified as being earthquakes and two others as being 'probably earthquakes'.

This area shows the lowest level of natural seismicity with respect to areas surrounding ARCESS and NORESS considering the number of natural events reported in the Helsinki bulletin. None of these four events was associated with a group which means that no aftershocks of similar sizes occurred.

Reference events could not be defined for area 60 only because of a too small data set of events with too low signal-to-noise-ratios.

As already mentioned in the first report, the comparison between the mine locations and the IMS event locations pointed out the existence of bias in distance and in azimuth in the IMS locations (e.g. area 39).

This part of Scandinavia shows the largest number of reported mines. This high mine density made it more difficult to associate a reference event with a particular mine. For a few areas, despite a large number of events with tight locations, no mines have been reported (e.g. area 62).

25	323575	3/31/92	20:05:10.1	65.8121	25.1158	1.66	B

Remarks:

- Events from groups A and B are identified as coming from the same mine HM22 in the Helsinki bulletin.
- Events 11, 21, 30, 31 showed similarities with events from group B (same $Lg - P$ times) and were also located at mine HM22 in the Helsinki bulletin.
- The events located South have the same $Lg - P$ time but different shape of the P arrival. In the Helsinki bulletin, an automatic location is given for these events.
- Events 1, 23, 26, 32 are close to each other according to the Helsinki locations and the cluster analysis put them in the same group; this could not be confirmed visually because of too low signal-to-noise ratios. The same remark can be made for events 5, 9, 10, 18 and 29.

Mine and event locations:

Figure 27: Mine and IMS event locations for area 28.

AREA 29

Latitude: 64- 66°N

Longitude: 26 - 30°E

Local magnitude range: -

Number of events in IMS2: 62

Number of events within the magnitude range: 62

Number of processed events: 25

Frequency range used to process the data: 2 - 16 Hz

Processed signal length: 10 s. before P, 90 s. after P

Number of reference events: 6

Remarks:

- Events from groups A, B and C originate from mine HM8 (HA23) according to the Helsinki bulletin.
- Events from groups E and F, located in the center of the map (Figure 28) are far from the reported mines.

Mine and event locations:

Remarks:

- Most of the events located in this area are identified in the Helsinki bulletin as originating from mine HV10 (HC17).
- Except for a few events, the locations are tight around this mine.
- Most of these events are found on the cluster tree at a cross-correlation level

greater than 0.72, including the events that could not be identified because of too low signal-to-noise ratios.

Mine and event locations:

Figure 29: Mine and IMS event locations for area 30.

AREA 34

Latitude: 62 - 64°N

Longitude: 18 - 24°E

Local magnitude range: > 1.0

Number of events in IMS2: 395

Number of events within the magnitude range: 83

Number of processed events: 69

Frequency range used to process the data: 2 - 16 Hz

Processed signal length: 7 s. before P, 67 s. after P

Number of reference events: 11

Remarks:

- Eleven (11) groups were defined for only forty-six (46) events. Most of them include only two or three events.
- According to the Helsinki bulletin, most of the events from groups A, F and H originate from mine HM 13 while most of the events from groups C and E originate from mine HM24.

Mine and event locations:

Figure 31: Mine and IMS event locations for area 35.

AREA 36

Latitude: 62 - 64°N

Longitude: 26 - 28°E

Local magnitude range: > 1.5

Number of events in IMS2: 391

Number of events within the magnitude range: 152

Number of processed events: 115

Frequency range used to process the data: 2 - 16 Hz

Processed signal length: 6 s. before P, 56 s. after P

Number of reference events: 16

Remarks:

- Two clusters of events are clearly seen on the map (Figure 32). The cluster located in the middle of the map consists of events from groups F through P and the cluster located North-West of the map consists of events from groups C, D and E.
- According to the identification found in the Helsinki bulletin these two clusters correspond to mines HM7 and HM13, respectively.
- Events from groups A and B are located North of the largest cluster. The closest mine is HM16.

Mine and event locations:

Figure 32: Mine and IMS event locations for area 36.

AREA 37

Latitude: 62 - 64°N

Longitude: 28 - 32°E

Local magnitude range: > 1.0

Number of events in IMS2: 143

Number of events within the magnitude range: 111

Number of processed events: 83

Frequency range used to process the data: 2 - 16 Hz

Processed signal length: 7 s. before P, 67 s. after P

Number of reference events: 10

Remarks:

- According to the identification reported in the Helsinki bulletin, events from group B originate from mine HC13 whose location is in area 40; events from groups G and J are from mine HM7; events from group I are from mine HM17.
- Events from groups C, D, E, F and H form a tight cluster located between mines HM12 and HM23. No events has been reported as originating from these mines.

Mine and event locations:

Remarks:

- Events from groups A, B and C were identified as originating from mine HV9 in the Helsinki bulletin.
- The events from groups A and B are systematically located further north (about 70 km) than the events from group C, located close to mine HV9.
- Events from group E are consistently located on the East side of Onezhskoye Ozero.

Remarks:

- Events from group A, C and F are located on the West side of Onezshkoye Ozero, events from group F being located south of events from groups A and C.
- These events are identified as originating from mine HV6 in the Helsinki bulletin. The difference between the mine location and the event locations shows a clear bias in distance: the events being located to far from the array.
- Events from group E are located on the East side of the lake far from any reported mine.

Mine and event locations:

Figure 35: Mine and IMS event locations for area 39.

AREA 40

Latitude: 60 - 62°N

Longitude: 30 - 34°E

Local magnitude range: > 1.0

Number of events in IMS2: 176

Number of events within the magnitude range: 142

Number of processed events: 113

Frequency range used to process the data: 1 - 16 Hz

Processed signal length: 6 s. before P, 56 s. after P

Number of reference events: 11

Remarks:

- Events from groups A, B, D and E are identified as originating from mine HV4 in the Helsinki bulletin, and events from groups C, F, G and H from mine HV7.
- The locations of these events are tight are mostly surrounding mine HV7.
- Two mines were located on SPOT photos in the vicinity of mine HV7 while no mines located close to mine HV4 were found on SPOT photos.

Mine and event locations:

Figure 36: Mine and IMS event locations for area 40.

AREA 41

Latitude: 60 - 62°N

Longitude: 28 - 30°E

Local magnitude range: > 2.0

Number of events in IMS2: 620

Number of events within the magnitude range: 168

Number of processed events: 124

Frequency range used to process the data: 1 - 16 Hz

Processed signal length: 5 s. before P, 45 s. after P

Number of reference events: 17

45	27875	6/27/91	15:22:46.2	60.0848	29.9720	2.41	Q

Remarks:

- Most of the event locations are concentrated in a 50x50 km area in the center of the map (Figure 37).
- Several mines have been reported that are only a few kilometers apart. The Helsinki identification of the events does not always correspond to the event grouping probably because of the too small distances between mines.

Mine and event locations:

Figure 37: Mine and IMS event locations for area 41.

AREA 42

Latitude: 60 - 62°N

Longitude: 26 - 28°E

Local magnitude range: > 1.0

Number of events in IMS2: 382

Number of events within the magnitude range: 116

Number of processed events: 90

Frequency range used to process the data: 1 - 16 Hz

Processed signal length: 4 s. before P, 34 s. after P

Number of reference events: 16

Table 132: Reference events for area 42

Remarks:

- Despite the large number of events located in this area, no mine locations are available. The Helsinki bulletin did not report any of these events as originating from a particular mine.
- A cluster of events is seen in the center of the map (Figure 38) on the coast of the Gulf of Finland. Several events are located off-shore.

Mine and event locations:

Figure 38: IMS event locations for area 42.

AREA 43

Latitude: 60 - 62°N

Longitude: 24 -26°E

Local magnitude range: > 1.3

Number of events in IMS2: 687

Number of events within the magnitude range: 109

Number of processed events: 79

Frequency range used to process the data: 1- 16 Hz

Processed signal length: 4 s. before P, 35 s. after P

Number of reference events: 13

Table 135: Reference events for area 43

Remarks:

- The Helsinki bulletin reported only one mine in this area, and the only event with a manual location did not originate from this mine.
- The automatic locations found in the Helsinki bulletin correspond to five well-defined spots. Each spot consists of one or several groups of events: group B; groups H, I and J; groups D and L; group M.
- Most of the events from group H were located off-shore by the IMS, about 30 km from their Helsinki locations.

Mine and event locations:

Remarks:

- Events from groups B and K are located close to mine HM5 but none of them had

a manual location in the Helsinki bulletin. The Helsinki automatic locations given for the events from group B are close mine HMS location.

- The other events are located along the Finnish coast or off-shore. According to the Helsinki bulletin, only the events from group I should be located off-shore.
- Events from group I occurred the same day within a couple of hours.

Remarks:

- Two mines are reported in the Helsinki bulletin for this area, but none of the events was identified as originating from one or the other. All events had automatic locations.

Mine and event locations:

Figure 41: Mine and IMS event locations for area 45.

AREA 54

Latitude: 58 - 60°N

Longitude: 20 - 24°E

Local magnitude range: > 1.0

Number of events in IMS2: 157

Number of events within the magnitude range: > 1.0

Number of processed events: 116

Frequency range used to process the data: 74

Processed signal length: 5 s. before P, 50 s. after P

Number of reference events: 7

Remarks:

- Despite the large number of events, no mine has been reported in the Helsinki bulletin. But, most of these events were located off-shore of the Finnish coast by the IMS.

Mine and event locations:

Figure 42: IMS event locations for area 54.

AREA 55

Latitude: 58 - 60°N

Longitude: 24 - 26°E

Local magnitude range: > 1.5

Number of events in IMS2: 409

Number of events within the magnitude range: 144

Number of processed events: 117

Frequency range used to process the data: 1 - 16 Hz

Processed signal length: 5 s. before P, 45 s. after P

Number of reference events: 14

Remarks:

- The area shows an important mining activity. Most of the events are located on the coast of Estonia.
- According to the identification found in the Helsinki bulletin, events from groups A, I and K originate from mine HE1; events from group L originate from mine HE2; events from groups E, F, J and N originate from mine HE3. Events from groups B and M showed locations either at mine HE2 or at mine HE3.

Mine and event locations:

Figure 43: Mine and IMS event locations for area 55.

AREA 56

Latitude: 58 - 60°N

Longitude: 26 - 28°E

Local magnitude range: > 2.2

Number of events in IMS2: 2805

Number of events within the magnitude range: 149

Number of processed events: 117

Frequency range used to process the data: 1 - 16 Hz

Processed signal length: 6 s. before P, 56 s. after P

Number of reference events: 12

Remarks:

- This area shows an important mining activity.
- According to the Helsinki bulletin identification, events from group A originate from mine HE9; events from groups F and H originate from mine HE5; events from groups J and K originate from mine HE4.

- Events from groups B and L shows locations either at mine HE4 or from at mine HE4A. These two mines are only 11 km apart.
- Events from group D are located either at mine HE6 or at mine HE6A. These mines are 7.5 km apart.

Remarks:

- According to the Helsinki bulletin identification, events from groups A, D, E, F, I and K originate from mine HE8;
- Events from the other groups show locations from several mines (HE7, HE8 and HE12A) within the same group.

Mine and event locations:

Figure 45: Mine and IMS event locations for area 57.

AREA 58

Latitude: 58 -60°N

Remarks:

- According to the identification found in the Helsinki bulletin, events from group A originate from mine HE11 and events from group B originate from mine HE10.
- The IMS located events from group C on the southern shore of the Gulf of Finland while for the same events, the Helsinki bulletin gave locations on the other side of the Gulf of Finland.

Mine and event locations:

Remarks:

- A cluster of events is clearly seen on the map (Figure 47), despite the fact that no mines have been reported in this area.

Mine and event locations:

Figure 47: IMS event locations for area 59.

AREA 60

Latitude: 56 -58°N

Longitude: 30 -36 E

Local magnitude range: -

Number of events in IMS2: 27

Number of events within the magnitude range: 27

Number of processed events: 16

Frequency range used to process the data: 3 - 16 Hz

Processed signal length: 12 s. before P, 112 s. after P

Number of reference events: None

Reported mine locations: None

Number of events found in the Helsinki bulletin: None

Events with the most reliable classification: None

Remarks:

- Small set of events with too low signal-to-noise ratios.

The map shows the study area in the Khatanga area. It includes a grid and labels for Russia, Ozero Il'mep, and various points (1-16, 56-58). The points are distributed across the map, with some points (1-16) marked with small squares and others (56-58) marked with small circles. The map also shows the location of Ozero Il'mep and the Khatanga area.

Figure 48: IMS event locations for area 60.

AREA 61

Latitude: 56 -58°N

Longitude: 24 - 30 E

Local magnitude range: -

Number of events in IMS2: 128

Number of events within the magnitude range: 128

Number of processed events: 80

Frequency range used to process the data: 3 -16 Hz

Processed signal length: 12 s. before P, 107 s. after P

Number of reference events: 8

Remarks:

- No mines have been reported in this area. The Helsinki bulletin reported only three events with automatic locations.

- Several cluster of events consisting in three or four events could be determined.
Mine and event locations:

Figure 49: IMS events locations for area 61. Borders between Estonia, Latvia and Russia are missing.

Remarks:

- No mines have been reported despite the number of events occurring in this area.
- The events reported in the Helsinki bulletin are located on the Gotland Island and correspond to events from group D.

Mine and event locations:

Figure 50: IMS events locations for area 62.

APPENDIX 2

The following table gives the list of the processing parameters used to perform the waveform comparison for each area. Lat1, Lat2, Lon1, and Lon2 give the limits of each area. Lfc and Hfc give the low frequency and the high frequency corner in Hz, respectively, used in the filtering. Sbf and Saf give, in seconds, the time before the first arrival and the time after the first arrival, respectively, defining the signal length.

Table 175: Processing parameters for FINESA data

Area	Lat1	Lat2	Lon1	Lon2	Lfc	Hfc	Sbf	Saf
28	64	66	24	26	2.0	16.0	9	84

APPENDIX 3

The mine locations provided in this appendix cover more than the studied area. Distance 1 defines the distance to the ARCESS array in degrees and Distance 2, in kilometers. Mines are ordered by increasing longitude.

Table 176: SPOT mine locations

Two tables are provided for the Helsinki mine locations. The locations shown in Table 177 started to be used at the beginning of June 1991. A mapping between the new Helsinki locations and the old Helsinki locations is proposed in this table. Certain mines can have up to four different locations reported in the Helsinki bulletin; only the most frequent are listed. Locations given with one decimal were obtained by averaging seismic locations; locations with two decimals were obtained from the SPOT imagery.

Table 177: Helsinki mine locations

Label	Old label	Latitude	Longitude	Distance 1	Distance 2	Azimuth

APPENDIX 4

The following table gives the results of an attempt to associate reference events with a particular mine. For this purpose, the event identification reported in the Helsinki bulletin were used. An association was made between a group of events and the Helsinki identifications when, within a group, all Helsinki identifications were reasonably consistent. When both an old Helsinki location and a new Helsinki location were used to identify events within a group, only the new location was listed.

When a large number of events from the same source overlapped two adjacent areas, two reference events were defined, one for each area. These redundant events are not included in the list.

For each reference event, the table gives:

- the area number,
- the event orid used in the IMS database,
- the event number used in the processing,
- the event label corresponding to the grouping,
- the event location using the identification found in the Helsinki bulletin,
- the number of events found in the Helsinki bulletin with the same identification,
- comment about the groups: (1) defines event groups consisting of more than three events, (2) defines event groups including three or fewer events.

- a. Inconsistency in the identification found in the Helsinki bulletin, that we assume to be an error.
- b. No reported mine in this area.
- c. Several mines have been located on SPOT photos in this area or in the nearby areas.
- d. Inconsistency in the identification found in the Helsinki bulletin because of the large number of mines in this area.
