# Source Code for the OO1 Benchmark and the AFIT Simulation Benchmark

Timothy J. Halloran<sup>†</sup>

## Abstract

This paper contains the source code for implementations of the OO1 benchmark and the AFIT simulation benchmark. OO1 benchmark implementations are listed for the Itasca, Matisse, and ObjectStore object-oriented database management systems (DBMS). An AFIT simulation benchmark implementation is listed for the ObjectStore object-oriented DBMS.

## 1 Introduction

As part of research into the performance of current commercial object-oriented DBMSs, we developed implementations of the OO1 benchmark and the simulation benchmark [2]. The OO1 benchmark is specified in [1]. The OO1 benchmark is a generic measure of object-oriented DBMS performance. The simulation benchmark is specified in [2]. The simulation benchmark examined the performance of object-oriented DBMSs in the simulation domain. This paper contains the source code for three implementations of the OO1 benchmark and one implementation of the simulation benchmark.

## 2 OO1 Benchmark

This section lists the source code for our implementations of the OO1 benchmark. Implementations were created for the Itasca, Matisse, and ObjectStore object-oriented DBMSs. Although several versions of these implementations were developed for each object-oriented DBMS, only our final implementation is shown.

All three OO1 benchmark implementations used the benchmark support software described in [2]. This common code is not listed for each implementation

### 2.1 Itasca Implementation

This section lists the source code for the Itasca implementation of the OO1 benchmark created for this research. The implementation was created on version 2.2 of Itasca using the Itasca C++ API. The Itasca OO1 benchmark source code builds one executable program, the *bench* program. The source files in this implementation are shown in Figure 1. The files *debug.hh*, *dice.hh*, *dice.cc*, *pmmlcg.h*, *pmmlcg.c*, *stopwatch.hh*, and *stopwatch.cc* are not listed, because they were described (with a full source code listing) in [2]. The following subsections list the source code for the other files shown in Figure 1.

---

<sup>†</sup>The author is with the Department of Electrical and Computer Engineering (AFIT/ENG), Air Force Institute of Technology, 2950 P ST, Wright-Patterson AFB, OH 45433-7765.

bench.cc

Air Force Institute of Technology  
 Timothy J. Halloran  
 26 Jul 1993

This program performs all the benchmark measurements for the 001 benchmark.  
 The following benchmark operations are supported: database creation (and  
 load), lookup, forward traversal, reverse traversal, insert, and database  
 clear (and destroy).

Revisions:  
 20 Aug 1993 -TJH- Changed out random number generator.

```

*/

### 2.1.3 connect.hh

The source code for the file *connect.hh* is listed below. This file defines function prototypes for the C++ class methods of the *OoiConnection* class. The *OoiConnection* class is fully defined in the file *schema.hh*. The *connect.hh* file is included into the file *schema.hh* during the definition of the *OoiConnection* class. Itasca Customer Support recommended including definitions of C++ class methods, rather than just adding them directly to the *schema.hh* file (as is recommended in the Itasca documentation [3]) to simplify maintenance.

```

#ifndef __CONNECT_HH
#define __CONNECT_HH
/*
    *****
    *      *      *      *      *
    *      *      *      *      *
    *      *      *      *      *      ITASCA
    *      *      *      *      *
    *      *      *      *      *
    *****
*/

```

"Object Operations Benchmark" R.G.G. Cattell and J. Skeen

oo1.cc

Air Force Institute of Technology  
 Timothy J. Halloran  
 26 Jul 1993

#### Revisions:

- 19 Aug 1993 -TJH- Changed the "report\_results()" function to provide more concise output.
- 20 Aug 1993 -TJH- Changed out random number generator.
- 21 Aug 1993 -TJH- Changed the "load()" function to perform intermediate commits (rather than trying to load the entire database in a single transaction). Loading the entire database was causing this program to use too much system memory.
- 07 Sep 1993 -TJH- Changed the code to fix several memory leaks. ITASCA does not manage the transient memory associated with

persistant objects as well as I thought, the application  
is responsible for freeing it in most cases.

## 2.1.9 params.hh

The source code for the file *params.hh* is listed below. This file defines several constant parameters which the OO1 benchmark implementation requires.

```

#ifndef __PARAMS_HH
#define __PARAMS_HH
/*
    #####      #
    #  #  #  #  #
    #  #  #  #  #
    #  #  #  #  #  ITASCA
    #  #  #  #  #
    #  #  #  #  #
    #####      #####

```

"Object Operations Benchmark" R.G.G. and J. Skeen  
Sun Microsystems

params.hh

Air Force Institute of Technology  
 Timothy J. Halloran  
 26 Jul 1993

Revisions:

21 Aug 1993 -TJH- Added Itasca specific parameter "NUM\_COMMIT". This parameter specifies the number of parts (connections) which will be created during the load operation before a commit is done.

```

*/
// definition of the number of connections for each part (3 for 001)
#define NUM_CONNECTIONS 3
// definition of the depth of the forward and reverse traversals (7 for 001)
#define TRAVERSAL_DEPTH 7
// definition of the locality of reference value (1 for 001 which means that
// 90% of the connections are randomly selected among the 1% of the parts
// which are closest (in terms of part id), and the rest of the connections
// are made to any randomly selected part.
#define LOCALITY_OF_REFERENCE 1
// definitions to create a 10 year range of dates
#define JAN_1_1980 315550800
#define JAN_1_1990 631170000
// 001 benchmark parameters
#define NUM_BENCHMARK_ITERATIONS 10
#define NUM_LOOKUP 1000
#define NUM_FORWARD_TRAVERSAL 1
#define NUM_REVERSE_TRAVERSAL 1
#define NUM_INSERT 100
// Itasca parameters
#define NUM_COMMIT 100
#endif __PARAMS_HH
    
```

## 2.1.10 part.hh

The source code for the file *part.hh* is listed below. This file defines function prototypes for the C++ class methods of the *Oo1Part* class. The *Oo1Part* class is fully defined in the file *schema.hh*. The *part.hh* file is included into the file *schema.hh* during the definition of the *Oo1Part* class. Itasca Customer Support recommended including definitions of C++ class methods, rather than just adding them directly to the *schema.hh* file (as is recommended in the Itasca documentation [3]) to simplify maintenance.

```

#ifndef __PART_HH
#define __PART_HH
/*

#####      *
*  *  *  *  *
*  *  *  *  *
*  *  *  *  *  ITASCA
*  *  *  *  *
*  *  *  *  *
#####      *
    
```

"Object Operations Benchmark" R.G.G. Cattell and J. Skeen  
 Sun Microsystems

part.hh

Air Force Institute of Technology

Timothy J. Halloran  
26 Jul 1993

This file only contains the function prototypes for the part class methods. This file is included by the "schema.hh" file (which was automatically generated by Itasca). Use of this file ensures that the changes necessary to the "schema.hh" file are not lost each time it is regenerated.

```
*/  
void set_OolPart( int new_id, char *new_type, int new_x, int new_y, long new_build );  
void clear_OolPart( );  
int forward_traversal( int current_level );  
int reverse_traversal( int current_level );  
#endif __PART_HH
```

### 2.1.11 part.cc

The source code for the file *part.cc* is listed below. This file implements the non-persistent methods for the *OolPart* class. The *OolPart* class is fully defined in the file *schema.hh*.

```

### 2.1.12 schema.hh

The source code for the file *schema.hh* is listed below. This file contains the definitions of all the C++ classes which are persistent in the Itasca database. The file was automatically generated by the Itasca Dynamic Schema Editor. The file includes the files *connect.hh* and *part.hh* which define the non-persistent C++ methods for the *Oo1Connection* and *Oo1Part* classes. This file does not create the schema in the Itasca database, the file *dbschema.dmp* is used to to that. The *dbschema.dmp* file must be loaded into Itasca prior to any C++ program compiled with this file to execute properly.

```

### 2.1.13 dbschema.dmp

The source code for the file *dbschema.dmp* is listed below. This file contains Itasca code, in the Lisp programming language, which creates the schema for the OO1 benchmark in the Itasca database. This file must be run on the Itasca database before the *bench* program is executed. The file must also be consistent with the *schema.hh* file, which describes the database schema for C++ programs which use it.

## 2.2 Matisse Implementation

This section lists the source code for the Matisse implementation of the OO1 benchmark created for this research. The implementation was created on version 2.2.0 of Matisse using the Object-Oriented Services API. The Matisse OO1 benchmark source code builds two executable programs, the *bench* program and the *ooschema* program. The source files in this implementation are shown in Figure 2. The files *debug.hh*, *dice.hh*, *dice.cc*, *pmmlcg.h*, *pmmlcg.c*, *stopwch.hh*, and *stopwch.cc* are not listed, because they were described (with a full source code listing) in [2]. The following subsections list the source code for the other files shown in Figure 2.

### 2.2.1 Makefile

The *Makefile* for the Matisse OO1 benchmark source code is listed below.

Figure 2: Matisse OO1 Benchmark Source Code Files

```

MATISSE_PATH=$(MTS_ROOT)

bench.cc

Air Force Institute of Technology  
 Timothy J. Halloran  
 16 Jul 1993

This program performs all the benchmark measurements for the OO1 benchmark.  
 The following benchmark operations are supported: database creation (and  
 load), lookup, forward traversal, reverse traversal, insert, and database  
 clear (and destroy).

Revisions:  
 22 Aug 1993 -TJH- Changed out random number generator.

### 2.2.5 macros.hh

The source code for the file *macros.hh* is listed below. This file contains the *CHECK\_STATUS* macro which is used in all portions of the benchmark implementation to ensure that a database error did not occur during a call to the Matisse database.

```

#ifndef __MACROS_HH
#define __MACROS_HH
/*

```

```

*****  *****  *
*  *  *  *  *
*  *  *  *  *
*  *  *  *  *  MATISSE
*  *  *  *  *
*  *  *  *  *
*****  *****  *****

```

 Timothy J. Halloran  
 16 Jul 1993

```

*/
#define CHECK_STATUS(status,message) \
    if (MtFailure (status)) { \
        MtPError(message); \
        exit(1); }
#endif __MACROS_HH

```

### 2.2.6 nullproc.hh

The source code for the file *nullproc.hh* is listed below. This file defines the null procedures which are required to be called at certain points in the OO1 benchmark.

```

#ifndef __NULLPROC_HH

```

```

#define __NULLPROC_HH
/*

#####
#   #   #   #
#   #   #   #
#   #   #   #   MATISSE
#   #   #   #

*ool.cc*

Air Force Institute of Technology  
 Timothy J. Halloran  
 31 Jul 1993

### Revisions:

- 22 Aug 1993 -TJH- Changed out random number generator.
- 22 Aug 1993 -TJH- Changed the "report\_results( )" function to provide more concise output.
- 04 Sep 1993 -TJH- Changed use of several API functions to Mt\_\* functions, (which use DIDs, rather than character strings) from Mt\* functions. This was recommended by MATISSE to improve performance.
- 16 Sep 1993 -TJH- Removed MATISSE schema creation and removal from this program (bench) into another program (oolschema).

## 2.2.10 oolschema.cc

The source code for the file *oolschema.cc* is listed below. This file is the source file for the *oolschema* program. The *oolshema* program loads (and can remove) the OO1 benchmark schema into the Matisse database. The schema must be loaded before the *bench* program can be run.

/\*

16 Sep 1993

This program creates or removes the MATISSE schema for the 001 benchmark.  
This program requires linking to the "matisseDS" library, while the "bench"  
program only requires linking to the "matisseDE" library (because it does  
not modify the database schema). The use of the DE library for the "bench"  
program was recommended by MATISSE to improve database performance.

Revisions:
16 Sep 1993 -TJH- Changed use of several API functions to Mt_* functions,
                  (which use OIDs, rather than character strings) from
                  Mt_* functions. This was recommended by MATISSE to
                  improve performance.

## 2.3 ObjectStore Implementation

This section lists the source code for the ObjectStore implementation of the OO1 benchmark created for this research. The implementation was created on version 2.0.1 of ObjectStore using the C++ DML API. The ObjectStore OO1 benchmark source code builds one executable program, the *bench* program. The source files in this implementation are shown in Figure 3. The files *debug.hh*, *dice.hh*, *dice.cc*, *pmmlcg.h*, *pmmlcg.c*, *stopwch.hh*, and *stopwch.cc* are not listed, because they were described (with a full source code listing) in [2]. The following subsections list the source code for the other files shown in Figure 3.

### 2.3.1 Makefile

The *Makefile* for the ObjectStore OO1 benchmark source code is listed below.

```

include $(OS_ROOTDIR)/etc/ostore.mk
OS_COMPILATION_SCHEMA_DB_PATH=
    prowler:/usr3/databases/ostore_data/ool.comp_schema
OS_APPLICATION_SCHEMA_DB_PATH=
    prowler:/usr3/databases/ostore_data/ool.app_schema
#####
#
# If debug output is desired uncomment the "CCFLAGS" definition with
# "-DDEBUG" in it. Only one definition should be uncommented.
#
#CCFLAGS=-I. -DDEBUG -gx
CCFLAGS=-I. -gx
#
#####

```

bench.cc

Air Force Institute of Technology  
 Timothy J. Halloran  
 06 Jul 1993

This program performs all the benchmark measurements for the 001 benchmark.  
 The following benchmark operations are supported: database creation (and  
 load), lookup, forward traversal, reverse traversal, insert, and database  
 clear (and destroy).

Revisions:

19 Jul 1993 -TJH- Added support to "clear" the benchmark database.  
 18 Aug 1993 -TJH- Added code so that ObjectStore would not try to read the  
                   entire segment at a time (bad for large database) and  
                   also set the fetch policy to os\_fetch\_page.  
 18 Aug 1993 -TJH- Changed out random number generator.

```

*/
#include<ostore/ostore.hh>
#include<ostore/coll.hh>

```

```

### 2.3.8 ool.cc

The source code for the file *ool.cc* is listed below. This file implements the *OO1* class. This class implements the benchmark measures and reporting functions required by the *OO1* benchmark. The *OO1* class is non-persistent.

 06 Jul 1993

Revisions: (revisions before 06 Jul 1993 are from previous programs)  
 01 Jul 1993 -TJH- Modified to include "params.hh" which contains the  
                   definitions of all benchmark parameters.  
 01 Jul 1993 -TJH- Modified the program so that elapsed time measurements for  
                   each iteration are stored in an array (called "results").  
                   The results are output after all the benchmark timing  
                   is done.  
 02 Jul 1993 -TJH- Changed the database build into a single transaction.  
 02 Jul 1993 -TJH- Created an index on the "id" attribute of the "part"  
                   class. This optimizes part id lookups (by queries).  
 06 Jul 1993 -TJH- Combined all the benchmark measurements into a single  
                   class, the "ool" class. The programs "loaddb", "lookup",  
                   "ftrav", "rtrav", and "insert" were merged.  
 07 Jul 1993 -TJH- The variable "num\_parts" was added as a class attribute,  
                   and removed as a parameter to every class method.

07 Jul 1993 -TJH- Moved starting and stoping the benchmark timer to outside of the database transactions (i.e. outside the "do\_transaction( ) { }" statement).

19 Jul 1993 -TJH- Combined functions so they could be used by "load" and "insert" to reduce the total amount of code.

19 Jul 1993 -TJH- Added the "clear" function to destroy the benchmark database.

20 Jul 1993 -TJH- Created the "report\_results" function to reduce the total amount of code.

20 Jul 1993 -TJH- Fixed several calculations which were not using the constants in "params.hh" properly (and would have caused errors if the values were changed).

29 Jul 1993 -TJH- Fixed a major bug in "ool::insert\_measure( )." The insert was not deleting the connection objects which were created. This was causing "core" dumps on the reverse traversal, which was finding these connection objects and trying to follow them back to part objects (which no longer existed).

02 Aug 1993 -TJH- Moved the removal of connections from a part which is being deleted from the "ool::insert\_measure( )" function to the destructor of the part class.

18 Aug 1993 -TJH- Changed out random number generator.

19 Aug 1993 -TJH- Changed the "report\_results( )" function to provide more concise output.

"Object Operations Benchmark" R.G.G. Cattell and J. Skeen  
 Sun Microsystems

part.cc

Air Force Institute of Technology  
Timothy J. Halloran  
18 Jun 1993

Revisions:

- 01 Jul 1993 -TJH- The function "null\_procedure\_1()" was changed to "null\_procedure".
- 06 Jul 1993 -TJH- Changed all the debug output to use the "debug.hh" macros.
- 21 Jul 1993 -TJH- Changed the type of "build" to long (from char) to comply with the benchmark specification.
- 29 Jul 1993 -TJH- Changed the constructor so that the "connected\_to" and "connected\_from" attributes included the behavior "os\_collection::maintain\_cursors." This allows the connection objects to delete themselves.
- 02 Aug 1993 -TJH- Moved the removal of connections from a part which is being deleted from the "ool::insert\_measure()" function to the destructor of the part class. The destructor function now deletes all the connection objects which involve the part being deleted. This will keep the database consistant.

### 3 Simulation Benchmark

This section lists the source code for our implementation of the simulation benchmark. An implementation was created for the ObjectStore object-oriented DBMS, and a non-persistent version was created. Only the ObjectStore implementation is listed due to the minor changes (removing the ObjectStore specific code) necessary to create the non-persistent version of the benchmark.

#### 3.1 ObjectStore Implementation

This section lists the source code for the ObjectStore implementation of the simulation benchmark. The implementation was created on version 2.0.1 of ObjectStore using the C++ DML API. The executable *simbench* is the benchmark program, and the executable *create* sets up a database for use with the benchmark program.

### 3.1.1 Makefile

The *Makefile* for the ObjectStore SimBench source code is listed below.

```
include $(OS_ROOTDIR)/etc/ostore.mk
OS_COMPILATION_SCHEMA_DB_PATH=
  prowler:/usr3/databases/ostore_data/sim.comp.schema
OS_APPLICATION_SCHEMA_DB_PATH=
  prowler:/usr3/databases/ostore_data/sim.app.schema

```

[illegible]

This module contains all the user interface code. The user interface uses the OSF Motif look and feel. Very little in this module should need to be changed to port the "simbench" program to a new object-oriented DBMS.

Revisions:  
24 Oct 1993 -TJH- Fixed a bug in the run until timing, the timer was waiting until the user pressed the OK button.
