EXECUTIVE SUMMARY

The purpose, essential findings, and major recommendations of the inclosed report follow:

a. Purpose. To quantify worker exposures to N-Nitrosodimethylamine (NDMA), 1,1-Dimethylhydrazine (UDMH) and hydrazine in the Hydrazine Blending Facility, Rocky Mountain Arsenal (RMA).

b. Essential Findings. Findings are based on sample results which have previously been provided to RMA. Analyses for UDMH and hydrazine were conducted onsite and results were left with RMA personnel. Contractual agreement was used to provide NDMA sample results directly to RMA.

(1) Air samples for UDMH and hydrazine were below levels of analytical sensitivity.

(2) Air samples for NDMA, (a regulated suspect carcinogen) showed levels in excess of the regulatory limit throughout the Hydrazine Blending Facility.

c. Major Recommendations.

(1) Provide and insure the continued use of full body protective clothing.

(2) Provide and insure the continued use of full facepiece, positive pressure, atmosphere supplying respirators for any entry or operation to be performed in the Hydrazine Blending Facility.

7-17 DECEMBER 1982

1. AUTHORITY. Letter, DRCSG-0, HQ DARCOM, 6 August 1982, subj: Hydrazine Facility - Abatement Plan Implementation, and attached inclosures.
2. REFERENCES. Refer to Appendix A for a listing of references used in this report.
3. ABBREVIATIONS. A glossary of technical terms and abbreviations used in this report is included as Appendix B.
4. PURPOSE. This study was conducted to quantify worker exposures to NDMA, UDMH and hydrazine in the Hydrazine Blending Facility, RMA, as required for Phase I, Facility Clean up and Decontamination (Refer to references 5 and 6, Appendix A).
5. BACKGROUND.
 - a. The Hydrazine Blending Facility, RMA, has been identified as containing, through airborne release, varying amounts of NDMA, a regulated suspect carcinogen (refer to references 2, 3, 4 and 7, Appendix A). The OSHA interpretation of the NDMA release and potential worker exposure constitutes violation of Title 29, CFR Part 1910.1016, N-Nitrosodimethylamine (refer to references 1 and 4, Appendix A). Phase I - Facility Clean up and Decontamination (refer to references 5 and 6, Appendix A) requires elimination of known and potential airborne sources of NDMA with follow-up air monitoring by this Agency. The ultimate goal of the hazard abatement plan is to allow personnel to enter the Hydrazine Blending Facility for routine visual inspections without necessity for SCBA. The use of SCBA and/or other supplied air devices is deemed necessary for operations involving blending and transfer.
 - b. All samples collected during this survey were general area samples. No operations were ongoing, nor were operating personnel present by study design.
 - c. The survey was conducted by 1LT Joseph B. Silkowski, MSC; Mrs. Susie W. Lynn, DAC; and Mr. Stephan C. Graham (P.O.), DAC, IHD. Analysis of hydrazine and UDMH samples was provided by Mr. George Podolak, DAC, Organic Environmental Chemistry Division, this Agency.

Use of trademarked names does not imply endorsement by the US Army, but is intended only to assist in identification of a specific product.

d. The current OSHA 8-hour PEL for hydrazine and UDMH established by 29 CFR 1910.1000, Air Contaminants, (Reference 1, Appendix A) is 1.0 ppm or 1.3 mg/m³ (1300 ug/m³) of air and 0.5 ppm or 1.0 mg/m³ (1000 ug/m³), respectively, with skin notation. The criteria recommended by the ACGIH (refer to reference 8, Appendix A) for hydrazine and UDMH is 0.1 ppm or 0.13 mg/m³ (130 ug/m³) and 0.5 ppm or 1.0 mg/m³ (1000 ug/m³), respectively, with "Skin" notation, as 8-hour TWA's. The legally enforceable levels of worker exposure are those stipulated in 29 CFR 1910, Occupational Safety and Health Standards. The recommended criteria of the ACGIH, although not legally enforceable, does represent the latest consensus of the ACGIH based on current scientific literature and philosophy. The ACGIH has placed hydrazine and UDMH in the group of industrial substances suspected of possessing carcinogenic potential for man (Refer to Appendix C, Occupational Exposure Standards and Criteria).

e. The current OSHA PEL for NDMA is "No detectable levels" per 29 CFR 1910.1016, N-Nitrosodimethylamine (Refer to Appendix C, Occupational Exposure Standards and Criteria).

6. PROCEDURE.

a. Hydrazine and UDMH.

(1) General area samples were taken to determine the atmospheric concentration of hydrazine and UDMH. DuPont® Constant Flow Samplers, Model P4000 or MSA® Air Samplers, Model G, both calibrated for 1.0 Lpm, were used for sampling. Pumps were calibrated daily and adjusted as necessary. Collecting media consisted of 250 mg of 40/60 mesh activated silica gel coated with concentrated sulfuric acid (20 percent by weight). Samples were collected at specific sites as "Repeated Samples" using 250 mg of 40/60 mesh firebrick coated with concentrated sulfuric acid (20 percent by weight). Sampling times varied from 120 to 167 minutes.

* "Skin" notation as defined by the ACGIH refers to the potential contribution to the overall exposure by the cutaneous route including mucous membranes and eyes, either by airborne, or more particularly, by direct contact with the substance. This designation is intended to suggest appropriate measures for prevention of cutaneous absorption so that the threshold limit is not invalidated.

● DuPont is a registered trademark of E. I. DuPont de Nemours and Co., Inc., Wilmington, Delaware.

● MSA is a registered trademark of Mine Safety Appliance Company, Pittsburgh, Pennsylvania.

(2) Repeated samples using firebrick media were collected at specific sites because moisture in silica gel tubes was observed to freeze in cold temperatures. The freezing of moisture in the silica gel tubes caused an increased resistance to air flow and possible reduction of collection sites for contaminants on the silica gel media.

(3) The analytical scheme consisted of: elution of samples from the sorbent with distilled water; formation of derivatives by the addition of 2-furaldehyde in sodium acetate solution; extraction of derivatives in ethyl acetate; and measurement by gas chromatography. The instrumentation used for analysis consisted of a Hewlett-Packard® 3800 Gas Chromatograph.

(4) Wipe samples of specific work area surfaces and equipment were collected to qualitate the effectiveness of Phase I clean up procedures. Wipe samples were collected using Whatman® Ashless Quantitative Grade Filter Paper (12.5 cm). Samples represented a surface area of approximately one square foot. The analytical procedure consisted of desorption with 0.4 molar sulfuric acid solution and analysis by liquid chromatography.

b. NDMA.

(1) General area samples were taken to determine the atmospheric concentration of NDMA. Samples were taken concurrently at locations used for hydrazine and UDMH sampling. DuPont Constant Flow Samplers, Model P4000 or MSA Air Samplers, Model G, both calibrated for 1.0 Lpm, were used for sampling. Pumps were calibrated daily and adjusted as necessary. The collection device used was a commercial Thermo Sorb/N® Air Sampler (refer to reference 10, Appendix A). Sampling times varied from 120 to 186 minutes.

(2) Analysis of NDMA samples was provided by Thermo Electron Corporation, Waltham, Massachusetts through contractual agreement with RMA. Results were provided to this Agency (refer to reference 7, Appendix A).

c. Quality Control. Quality control samples were provided by the Environmental Division, RMA for hydrazine, UDMH and NDMA.

 - ThermoSorb/N Air Sampler is a registered trademark of Thermo Electron Corporation, Waltham, Massachusetts.

7. FINDINGS AND DISCUSSION.

a. General area samples were collected at specific work locations based on known or potential hydrazine, UDMH and/or NDMA release or contamination. Figure, Appendix D, Diagram of Hydrazine Blending Facility and Sampling Points, shows the basic facility layout with identified sampling locations. Table D-1, Appendix D, Sampling Points, presents a narrative description of the specific sampling locations. Table D-2, Appendix D, Samples Collected Per Sampling Site, identifies the number of samples collected per sampling location including repeated samples. Appendix E, Weather Conditions During Sampling Periods, presents the approximate temperature, humidity and barometric pressure during sampling.

b. Results of sampling are present in: Table F-1, Appendix F, Results of Analyses of Atmospheric Samples, Table F-2, Appendix F, Results of Wipe Samples for Hydrazine and Unsymmetrical Dimethylhydrazine; and, Table F-3, Appendix F, Results of Analyses of Quality Control Samples for N-Nitrosodimethylamine Submitted by Rocky Mountain Arsenal to Thermo Electron Corporation, Analytical Instrument Division, Waltham, Massachusetts. Results are presented in ug/m^3 . The analytical limits of detection of general area samples for hydrazine, UDMH and NDMA were 0.05, 0.10, and 0.05 ug/m^3 , respectively. The analytical limits of detection of wipe samples for hydrazine and UDMH were 5 ug and 0.2 ug , respectively. Sample results reported as "less than" the comparative detection limit are based on the limits of sampling and analytical methodology, and may not represent the actual presence of contaminant.

c. All general area hydrazine and UDMH samples were below the detectable limits of analysis (refer to Table F-1, Appendix F).

d. Wipe samples for hydrazine and UDMH identified the drum loading station filling nozzles and connectors as being a source of contact contamination. The control panel of the mixing and blending area, and the electrical outlet north of Tank HAS-1 showed relatively low levels of UDMH contamination. The use of wipe sample results is only to qualitate contaminant locations.

e. Results of NDMA sampling demonstrated that all work areas had some degree of detectable contamination. The blending and mixing area had NDMA contamination ranging from none detected to 20.0 ug/m^3 (SP-22, SP-9, 10 & 11); the waste sump ranged from none detected to 2.6 ug/m^3 (SP-3, 4, 5 and 6); the drum storage area ranged from 1.0 to 1.4 ug/m^3 (SP-21); the interior of Building 759 ranged from 1.3 to 1.7 ug/m^3 (SP-7); the tank storage area ranged from 0.5 to 4.7 ug/m^3 (SP-12 thru 16 and 20); the east area tank facility ranged from trace levels to 0.62 ug/m^3 (SP-17, 18 & 19).

f. The total Hydrazine Blending Facility has been assumed to be contaminated with NDMA and workers entering this area have been so protected. Sampling point SP-1, north fence entrance, has been identified as having "trace" amounts of NDMA exposure. This implies that the Personnel Change Facility Trailer located within 50 feet of this point may not be located to protect the workers from potential NDMA exposure. The specific source(s) of the NDMA contamination could not be determined, but it can be assumed that the prevailing winds from the facility carry NDMA from contamination sources from within the facility. Workers entering the Personnel Change Facility Trailer may be carrying NDMA contamination on their protective clothing following operations within the facility. Potential, therefore, exists for NDMA exposure within the change trailer from protective clothing removal.

8. CONCLUSION.

a. There were no sources of detectable quantities of hydrazine or UDMH contamination identified by air sampling.

b. Wipe sampling identified the drum loading station filler nozzles and connectors, the control panel of the mixing and blending area, and the electrical outlet north of Tank HAS-1 as sites of potential hydrazine/UDMH contact exposure.

c. Detectable quantities of NDMA were present, as air contaminants, throughout the Hydrazine Blending Facility.

d. Potential exists for worker exposure to "detectable amounts" of NDMA at the Personnel Change Facility Trailer located approximately 50 feet from the north fence entrance (SP-1).

9. RECOMMENDATIONS. The following recommendations are based on requirements of OSHA Regulation 29 CFR 1910.1016 and good industrial hygiene practice. The issue of the applicability of the scope of 29 CFR 1910.1016 to the Blending Facility will not be addressed in this study. Good industrial hygiene practice relates to reasonable and prudent measures deemed necessary based on the views of the ACGIH that UDMH and hydrazine have carcinogenic potential.

a. Provide and insure the continued use of personal protective full body clothing to prevent skin contact with potentially contaminated NDMA, UDMH and/or hydrazine work surfaces. Continue to provide levels of protective clothing based on the specific types of activities or operations to known or possible NDMA, UDMH and/or hydrazine exposure as presented in reference 4 and 5, Appendix A.

b. Provide and insure the continued use of full facepiece, pressure demand atmosphere supplying respirators (air line, SCBA) for any entry or

operation to be performed in the Hydrazine Blending Facility. The finding of detectable levels of NDMA throughout the Hydrazine Blending Facility during a period of nonoperation, following clean-up procedures, necessitates continued and specific use of atmosphere supplying devices.

c. Provide documentation sampling of potential NDMA exposure inside and around the Personnel Change Facility Trailer. [Note: Sampling assistance may be provided by USAEHA personnel stationed at Fitzsimmons Army Medical Center (USAEHA - Regional Division West, AUTOVON 943-3725/8881).]

10. TECHNICAL ASSISTANCE. Requests for services should be directed through appropriate command channels of the requesting activity to the Commander, US Army Environmental Hygiene Agency, ATTN: HSHB-OI-F, Aberdeen Proving Ground, MD 21010, with an information copy furnished the Commander, US Army Health Services Command, ATTN: HSPA-P, Fort Sam Houston, TX 78234.

TABLE F-2. RESULTS OF WIPE SAMPLES FOR HYDRAZINE AND UNSYMMETRICAL DIMETHYL-HYDRAZINE

Sample Number	Location	Results (in micrograms-total)	
		Hydrazine	UDMH*
W-100	Electrical control panel (west fence)	<5	0.2
W-101	Ground wipe, Drum Steamout (SP-8)	<5	<0.2
W-102	Electrical outlet north of Tank HAS-1	<5	0.3
W-103	Desktop and telephone inside Building 759	<5	<0.2
W-104	Empty barrel storage south of SP-21	<5	<0.2
W-105	Gauges and piping around sump pump at Waste Sump	<5	<0.2
W-106	Control Panel (SP-9)	<5	6
W-107	Water Sample from Waste Sump	<5	<0.2
W-108	Drum loading station (wipe of drum filling nozzles/connectors)	3,475	19.0
W-109	Tank HAS-2, drain valve (Tank pit valve)	<5	<0.2
W-110	Tank HAS-1, control valve (on top)	broken	
W-111	Tank Truck Station, Truck loading filler nozzle and boom	broken	

* UDMH - 1,1-Dimethylhydrazine.
