GENERAL INSTRUCTIONS FOR COMPLETING SF 298

The Report Documentation Page (RDP) is used in announcing and cataloging reports. It is important that this information be consistent with the rest of the report, particularly the cover and title page. Instructions for filling in each block of the form follow. It is important to **stay within the lines to meet optical scanning requirements.**

Block 1. Agency Use Only (Leave Blank)

Block 2. Report Date. Full publication date including day, month, and year, if available (e.g. 1 Jan 88). Must cite at least the year.

Block 3. Type of Report and Dates Covered. State whether report is interim, final, etc. If applicable, enter inclusive report dates (e.g. 10 Jun 87 - 30 Jun 88).

Block 4. Title and Subtitle. A title is taken from the part of the report that provides the most meaningful and complete information. When a report is prepared in more than one volume, repeat the primary title, add volume number, and include subtitle for the specific volume. On classified documents enter the title classification in parentheses.

Block 5. Funding Numbers. To include contract and grant numbers; may include program element number(s), project number(s), task number(s), and work unit number(s). Use the following labels:

C	- Contract	**PR**	- Project
G	- Grant	**TA**	- Task
PE	- Program Element	**WU**	- Work Unit Accession No.

Block 6. Author(s). Name(s) of person(s) responsible for writing the report, performing the research, or credited with the content of the report. If editor or compiler, this should follow the name(s).

Block 7. Performing Organization Name(s) and Address(es). Self-explanatory.

Block 8. Performing Organization Report Number. Enter the unique alphanumeric report number(s) assigned by the organization performing the report.

Block 9. Sponsoring/Monitoring Agency Names(s) and Address(es). Self-explanatory.

Block 10. Sponsoring/Monitoring Agency. Report Number. (If known)

Block 11. Supplementary Notes. Enter information not included elsewhere such as: Prepared in cooperation with...; Trans. of ..., To be published in .... When a report is revised, include a statement whether the new report supersedes or supplements the older report.

Block 12a. Distribution/Availablity Statement. Denote public availability or limitation. Cite any availability to the public. Enter additional limitations or special markings in all capitals (e.g. NOFORN, REL, ITAR)

DOD - See DoDD 5230.24, "Distribution Statements on Technical Documents."
DOE - See authorities
NASA - See Handbook NHB 2200.2.
NTIS - Leave blank.

Block 12b. Distribution Code.

DOD - DOD - Leave blank
DOE - DOE - Enter DOE distribution categories from the Standard Distribution for Unclassified Scientific and Technical Reports
NASA - NASA - Leave blank
NTIS - NTIS - Leave blank.

Block 13. Abstract. Include a brief (Maximum 200 words) factual summary of the most significant information contained in the report.

Block 14. Subject Terms. Keywords or phrases identifying major subjects in the report.

Block 15. Number of Pages. Enter the total number of pages.

Block 16. Price Code. Enter appropriate price code (NTIS only).

Blocks 17. - 19. Security Classifications. Self-explanatory. Enter U.S. Security Classification in accordance with U.S. Security Regulations (i.e., UNCLASSIFIED). If form contains classified information, stamp classification on the top and bottom of the page.

Block 20. Limitation of Abstract. This block must be completed to assign a limitation to the abstract. Enter either UL (unlimited) or SAR (same as report). An entry in this block is necessary if the abstract is to be limited. If blank, the abstract is assumed to be unlimited.

DISCLAIMER NOTICE

THIS DOCUMENT IS BEST QUALITY AVAILABLE. THE COPY FURNISHED TO DTIC CONTAINED A SIGNIFICANT NUMBER OF COLOR PAGES WHICH DO NOT REPRODUCE LEGIBLY ON BLACK AND WHITE MICROFICHE.

FOREWORD

The vast majority of sea ice data in the world today is stored in the form of ice charts prepared by the various ice services of different countries. It has long been recognized that data in this form have limited use for statistical and climatological summaries. Efforts are now being made by several countries to construct digital representations of these charts.

The United States Navy/National Oceanic and Atmospheric Administration (NOAA) Joint Ice Center (JIC) initiated a Sea Ice Digitization Program funded by the United States Navy in 1981. This Atlas and its Arctic East and Antarctic counterparts are a result of that initiative. Having ice data in digital format allows the construction of composite analyses that previously would have been impractical to produce.

ACKNOWLEDGEMENTS

This Atlas was prepared under the auspices of the Commander, Naval Oceanography Command and was coordinated by the Naval Oceanography Command Detachment, Asheville, North Carolina. The work was performed by the National Climatic Data Center (NCDC) in Asheville, North Carolina.

Specific acknowledgement is made to members of NCDC: Project Manager and System Designer, Richard Knight; and digitizer technician Elizabeth Koon. Credit is given to Mr. Don G. Barnett of the Joint Ice Center/Naval Polar Oceanography Center for his considerable efforts involving the analysis of the final summaries and quality control of the charts. Also credited are Lieutenant Commander D. Butler and Brian Wallace of the Naval Oceanography Command Detachment, Asheville for their help in coordinating the project.

Semi-Monthly Coverage and Extent Statistics	143-147

INTRODUCTION

Through 1965, reliable sea ice information in the Arctic regions was based on limited aerial reconnaissance data augmented by sparse shore station and ship reports. These data were further restricted to relatively small areas observed primarily during the summer season. From 1966 to 1972, the addition of visible and infrared satellite imagery expanded analysis capabilities, but considerable limitations were still imposed by clouds and seasonal darkness. Since the further addition in 1973 of all weather/season passive microwave satellite imagery, it has been possible to routinely map the extent of Arctic sea ice on a global scale. Arctic sea ice analyses have been operationally produced on a weekly basis since January 1973. This atlas contains sea ice summaries derived from 574 weekly JIC sea ice analyses produced from 1972 through 1982.

OVERVIEW

I. DATA SOURCES

The weekly analyses (Figure 1) produced at the JIC result from the synthesis of four general groups of data. These data sources are: 1) shore station reports, 2) ship reports, 3) aerial reconnaissance, and 4) satellite imagery and data. Satellite imagery and data, however, comprises over 90 percent of the data utilized in the Arctic sea ice analyses.

The satellite data utilized fall into three categories: 1) visible imagery, 2) thermal infrared imagery, and 3) passive microwave imagery and data. Visible and infrared imagery have been utilized from a series of NOAA Polar Orbiting Satellites and Defense Meteorological Satellite Program (DMSP) satellites. Passive microwave imagery have been utilized from the NIMBUS-5 Electrically Scanning Microwave Radiometer (ESMR) and the NIMBUS-7 Scanning Multichannel Microwave Radiometer (SMMR). A near continuous source of passive microwave imagery and data has been available since January 1973. Table 1 identifies satellite sensors utilized from 1979 through 1982. Accurate records of satellite data used at the JIC prior to 1979 are not available. Estimates have been made concerning the percent of utilization of each of the satellite sources. During the summer, visible and infrared imagery provides about 65% of the data and passive microwave 35%. During the winter, the figures are approximately 35% and 65% respectively.

II. DIGITIZATION

Each weekly sea ice analysis chart has been digitized at the NCDC. This process converts the analog data to digital values at predetermined grid points. The digital data are stored in a standardized format called SIGRID (Sea Ice GRID) which is under study for adoption by the World Meteorological Organization. The grid points are identified by earth coordinates and have a resolution of 15 nautical miles or better.

III. COMPOSITING TECHNIQUE

The SIGRID format is easily expanded to provide ice data at each grid point over the Polar region. One can think of each grid point as being a cell in a two dimensional matrix. In a composite analysis, each cell becomes a storage location for accumulating some derived quantity of interest. For example, if we are given a ten-chart period of record, we could count the number of times that ice was observed in the grid cell located at say: 75N, 179W. If the composite count were eight (8) we could then say that there was an 80 percent probability of occurrence of ice at 75N, 179W for that period of record. In a similar fashion, other quantities such as sea ice concentration may be accumulated in a gridded array and subsequently used in a composite analysis.

IV. CALCULATIONS

This atlas contains groups of charts composited over a semi-monthly period centered on the first (1st) and the fifteenth (15th) of each month. The composite classifications are as follows:

1) Maximum, Mean and Minimum Ice Edges
2) Probability of Occurrence of Any Ice
3) Mean Ice Concentration
4) Mean Ice Concentration When Ice is Present
5) Maximum, Mean and Minimum Extent of 5/10ths or More of Ice

Each composite classification contains three or more boundary categories. The isopleth that defines each boundary is determined by the existence of a particular composite grid cell value. The grid cells that meet the specified boundary criterion are identified and re-labeled with a single digit. Thus, for example, all of the grid cells meeting the boundary criterion for minimum sea ice edge would be

MAXIMUM, MEAN AND MINIMUM ICE EDGE

Composite values, V, within a given grid cell are defined as:

$$V = \sum_{i=1}^{N} Z_i$$

Z is a binary value defined as:
0 - non-occurrence of ice
1 - occurrence of ice

N is the number of charts used in the compositing period.

The three ice edges are defined as:

Maximum Ice Edge - $V \geq 1$
Mean Ice Edge - $V \geq .5N$
Minimum Ice Edge - $V = N$

PROBABILITY OF OCCURRENCE OF ANY ICE

$$V = \sum_{i=1}^{N} Z_i$$

Z is a binary value defined as:
0 - non-occurrence of ice
1 - occurrence of ice

N is the number of charts

The five isopleths are defined as:

Greater than 0% Probability	$V \geq 1$
20% Probability	$V \geq .2N$
40% Probability	$V \geq .4N$
60% Probability	$V \geq .6N$
80% Probability	$V \geq .8N$

MEAN ICE CONCENTRATION

$$V = \frac{\sum_{i=1}^{N} C_i}{N}$$

C is the ice concentration in percent

N is the number of charts

The four isopleths are defined as:

Greater than 0% Concentration	$V > 0$
20% Concentration	$V \geq 20$
50% Concentration	$V \geq 50$
80% Concentration	$V \geq 80$

MEAN ICE CONCENTRATION WHEN ICE IS PRESENT

The definition is identical to Mean Ice Concentration except that N represents the number of charts having an ice concentration greater than zero in the selected grid cell. This prevents the mean ice concentration from being diluted by periods of no ice.

MAXIMUM, MEAN AND MINIMUM EXTENT

four general groups of data. These data sources are: 1) shore station reports, 2) ship reports, 3) aerial reconnaissance, and 4) satellite imagery and data. Satellite imagery and data, however, comprises over 90 percent of the data utilized in the Arctic sea ice analyses.

The satellite data utilized fall into three categories: 1) visible imagery, 2) thermal infrared imagery, and 3) passive microwave imagery and data. Visible and infrared imagery have been utilized from a series of NOAA Polar Orbiting Satellites and Defense Meteorological Satellite Program (DMSP) satellites. Passive microwave imagery have been utilized from the NIMBUS-5 Electrically Scanning Microwave Radiometer (ESMR) and the NIMBUS-7 Scanning Multichannel Microwave Radiometer (SMMR). A near continuous source of passive microwave imagery and data has been available since January 1973. Table 1 identifies satellite sensors utilized from 1979 through 1982. Accurate records of satellite data used at the JIC prior to 1979 are not available. Estimates have been made concerning the percent of utilization of each of the satellite sources. During the summer, visible and infrared imagery provides about 65% of the data and passive microwave 35%. During the winter, the figures are approximately 35% and 65% respectively.

II. DIGITIZATION

Each weekly sea ice analysis chart has been digitized at the NCDC. This process converts the analog data to digital values at predetermined grid points. The digital data are stored in a standardized format called SIGRID (Sea Ice GRID) which is under study for adoption by the World Meteorological Organization. The grid points are identified by earth coordinates and have a resolution of 15 nautical miles or better.

III. COMPOSITING TECHNIQUE

The SIGRID format is easily expanded to provide ice data at each grid point over the Polar region. One can think of each grid point as being a cell in a two dimensional matrix. In a composite analysis, each cell becomes a storage location for accumulating some derived quantity of interest. For example, if we are given a ten-chart period of record, we could count the number of times that ice was observed in the grid cell located at say: 75N, 179W. If the composite count were eight (8) we could then say that there was an 80 percent probability of occurrence of ice at 75N, 179W for that period of record. In a similar fashion, other quantities such as sea ice concentration may be accumulated in a gridded array and subsequently used in a composite analysis.

IV. CALCULATIONS

This atlas contains groups of charts composited over a semi-monthly period centered on the first (1st) and the fifteenth (15th) of each month. The composite classifications are as follows:

1) Maximum, Mean and Minimum Ice Edges
2) Probability of Occurrence of Any Ice
3) Mean Ice Concentration
4) Mean Ice Concentration When Ice is Present
5) Maximum, Mean and Minimum Extent of 5/10ths or More of Ice

Each composite classification contains three or more boundary categories. The isopleth that defines each boundary is determined by the existence of a particular composite grid cell value. The grid cells that meet the specified boundary criterion are identified and re-labeled with a single digit. Thus, for example, all of the grid cells meeting the boundary criterion for minimum sea ice edge would be identified with a code digit '3'. In general, there are hundreds, sometimes thousands, of adjacent grid cells sharing the same identification code digit. To find the peripheral boundary of this example region one can eliminate, in a graphical sense, all of the false partitions that exist between cells containing the same identification code. What is left is the boundary separating grid cells meeting one criterion from grid cells meeting different criteria. Clearly, one could envision certain situations where this method of boundary analysis would yield rather chaotic results. However, thanks to the inherent continuity of persistence of sea ice features this method works quite well. The boundary criteria utilized in the various ice climatology classifications are as follows.

$V = \sum_{i=1} Z_i$ 1 = occurrence of ice

N is the number of charts used in the compositing period.

The three ice edges are defined as:

Maximum Ice Edge	-	$V \geq 1$
Mean Ice Edge	-	$V \geq .5N$
Minimum Ice Edge	-	$V = N$

PROBABILITY OF OCCURRENCE OF ANY ICE

$$V = \sum_{i=1}^{N} Z_i$$

Z is a binary value defined as:
0 - non-occurrence of ice
1 - occurrence of ice

N is the number of charts

The five isopleths are defined as:

Greater than 0% Probability	$V \geq 1$
20% Probability	$V \geq .2N$
40% Probability	$V \geq .4N$
60% Probability	$V \geq .6N$
80% Probability	$V \geq .8N$

MEAN ICE CONCENTRATION

$$V = \frac{\sum_{i=1}^{N} C_i}{N}$$

C is the ice concentration in percent

N is the number of charts

The four isopleths are defined as:

Greater than 0% Concentration	$V > 0$
20% Concentration	$V \geq 20$
50% Concentration	$V \geq 50$
80% Concentration	$V \geq 80$

MEAN ICE CONCENTRATION WHEN ICE IS PRESENT

The definition is identical to Mean Ice Concentration except that N represents the number of charts having an ice concentration greater than zero in the selected grid cell. This prevents the mean ice concentration from being diluted by periods of no ice.

MAXIMUM, MEAN AND MINIMUM EXTENT OF 5/10ths OR MORE OF ICE

The definition is the same as for Maximum, Mean and Minimum Ice Edge with the exception of the definition of Z which is now:

Z is a binary value defined as:
0 - non-occurrence of 5/10ths or more of ice
1 - occurrence of 5/10ths or more of ice.

cm - Centimeter
ESMR - Electrically Scanning Microwave Radiometer
GAC - Global Area Coverage
HRPT - High Resolution Picture Transmission
IR - Infrared
km - Kilometer
LAC - Local Area Coverage
NIR - Near Infrared
SMMR - Scanning Multichannel Microwave Radiometer
VHRR - Very High Resolution Radiometer
VIS - Visible
um - Micrometer

V. INTERPRETATION

Interpretation of the charts in this Atlas should be straightforward. A possible conflict may arise if one tries to reconcile the terminology "ice edge" with the depiction of the shaded area. The shaded presentation was chosen in lieu of simpler isopleth display to minimize the chance for false interpretation of the data. This is because a label on an isopleth does not explicitly define the conditions on either side of the line. The slope of the gradient is not so clearly obvious as it is on a topographic map of the Earth's surface. This is compounded by the fact that the presence of sea ice is discontinuous in nature and whereby regions of 80% mean ice concentrations may be bordering regions of 20% ice concentrations with no intermediate region of 50% ice concentration. Shading provides and unequivocal sense of direction to the slope of the gradient which is quite necessary for correct interpretation, especially during the spring and summer seasons.

An alternate way of thinking about the meaning of a particular shaded area is to refer directly to the definitions given above. Using these, one can interpret the shaded areas for Minimum Ice Edge as being an aggregation of grid cells which always contained ice over the composite period. The shaded area that falls between the Mean Ice Edge and the Minimum Ice Edge are all those cells that contained ice at least half of the composite period. Likewise, the shaded area between the Mean Ice Edge and the Maximum Ice Edge represents all those cells that contained ice at least once in the composite period but not more than half of the composite period. Interpretations of the other shading classifications can be made in a similar manner.

Experience has shown that when sea ice occurs in a particular area it almost always occurs in high concentrations. For this reason the Mean Ice Concentration When Ice is Present summary was developed. Because the Mean Ice Concentration summary treats instances of no ice occurrence as zero ice concentration the summary may present misleadingly low concentration values as compared with the ice concentrations actually encountered. Figures 2, 3 and 4 illustrate a case in point. A vessel planning on penetrating the ice pack to the Antarctic continent along the route indicated would expect to encounter ice of 0 tenths to 2 tenths concentration based on the Mean Ice Concentration, Figure 2. Examining the Probability of Occurrence of Any Ice, Figure 3, and the Mean Ice Concentration When Ice Is Present, Figure 4, it is apparent that there is a 0% to 20% probability of encountering ice but that if encountered, it will be 2 tenths to 6 tenths concentration. For ships that are not icebreakers but are merely ice reinforced or not reinforced at all the difference in expected ice concentration may make a significant difference in the planning and the eventual outcome of the voyage.

TABLE AND FIGURES OF ICE

Two ice-coverage statistics are presente
ice coverage is the summation of areas of all
ice. The total ice coverage category is the
multiplied by the concentration in that cell.
an equivalent area of 100% concentration of i

Total extent and coverage statistics are
(90°E - 90°W) as well as for twelve sub areas
tables contain data for each weekly chart tha
thirteen tables is semi-monthly composite data
each month.

Following the tables there are thirteen
ice coverage and extent for the entire Arctic
for the years 1972-1982.

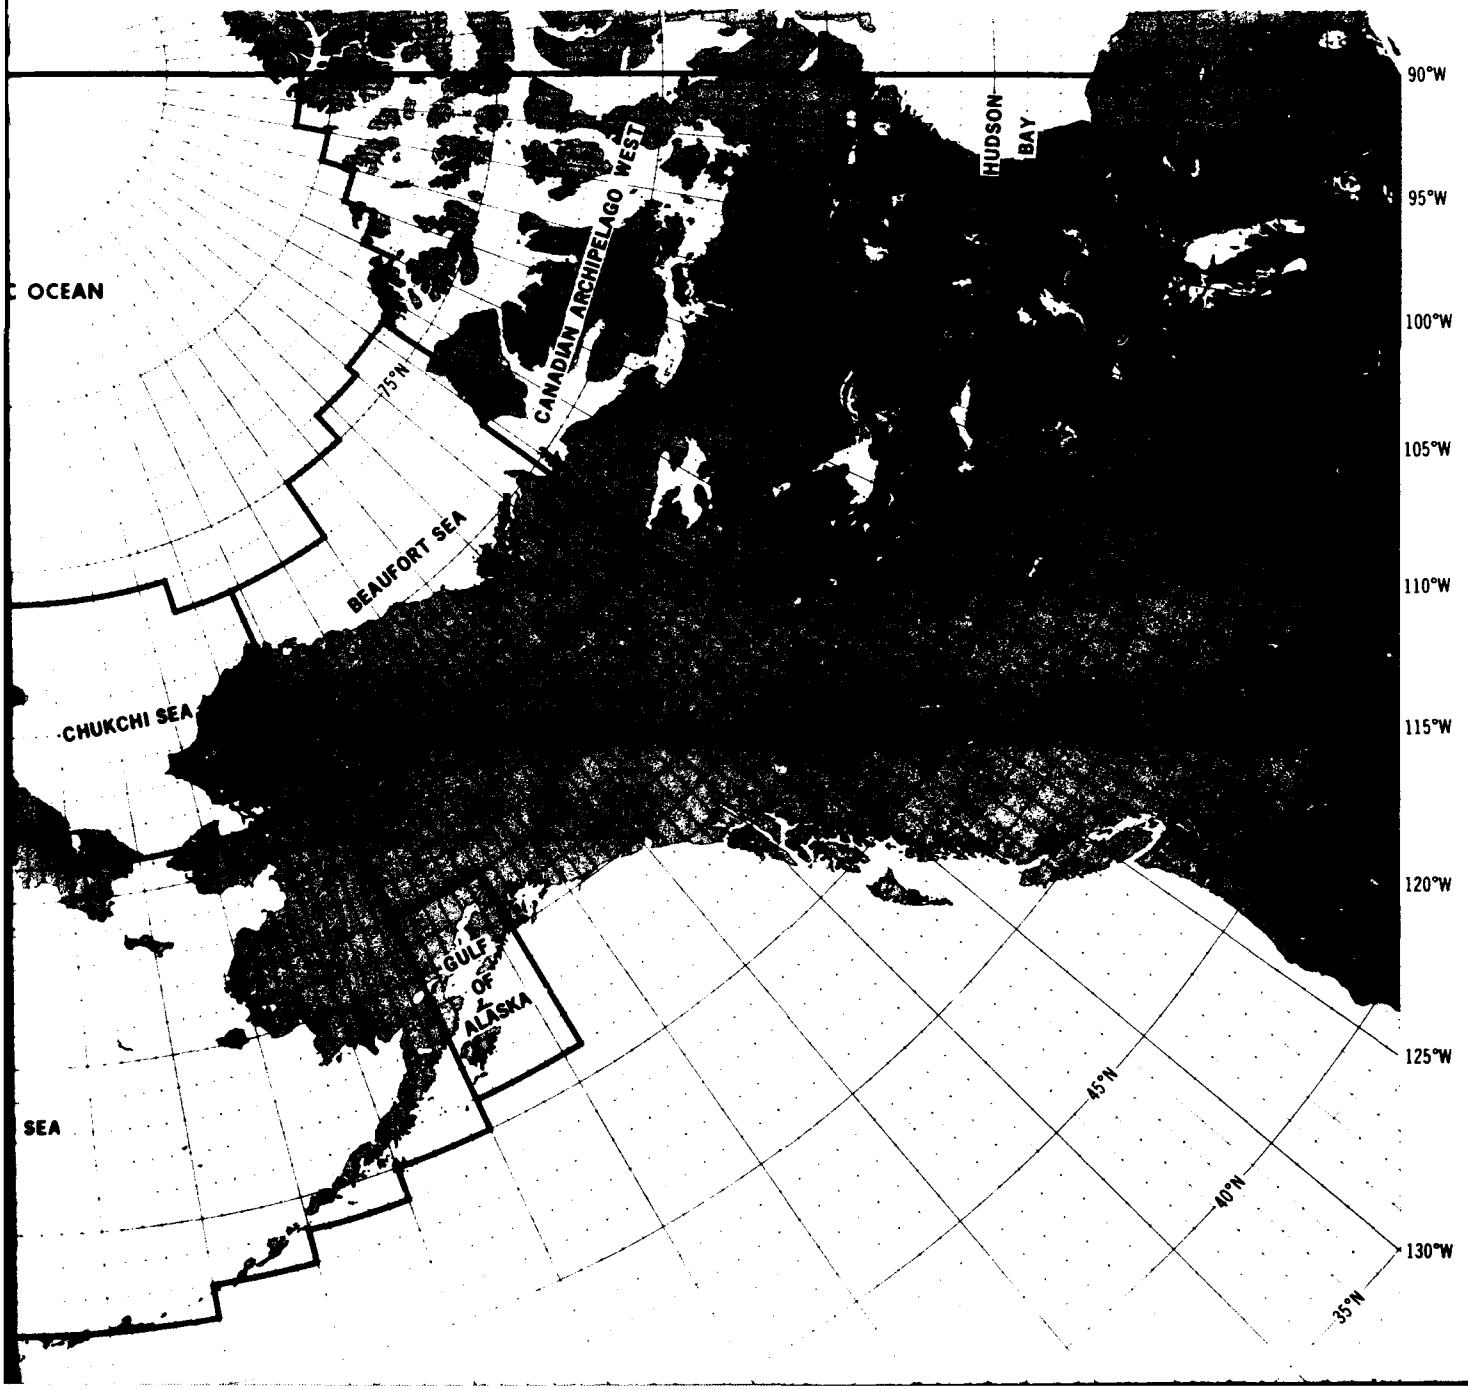

F ICE COVERAGE AND EXTENT

e presented in tabular form. The total extent of
as of all grid cells having any concentration of
y is the summation of the area in each grid cell
hat cell. Thus, total coverage is a measure of
tion of ice.

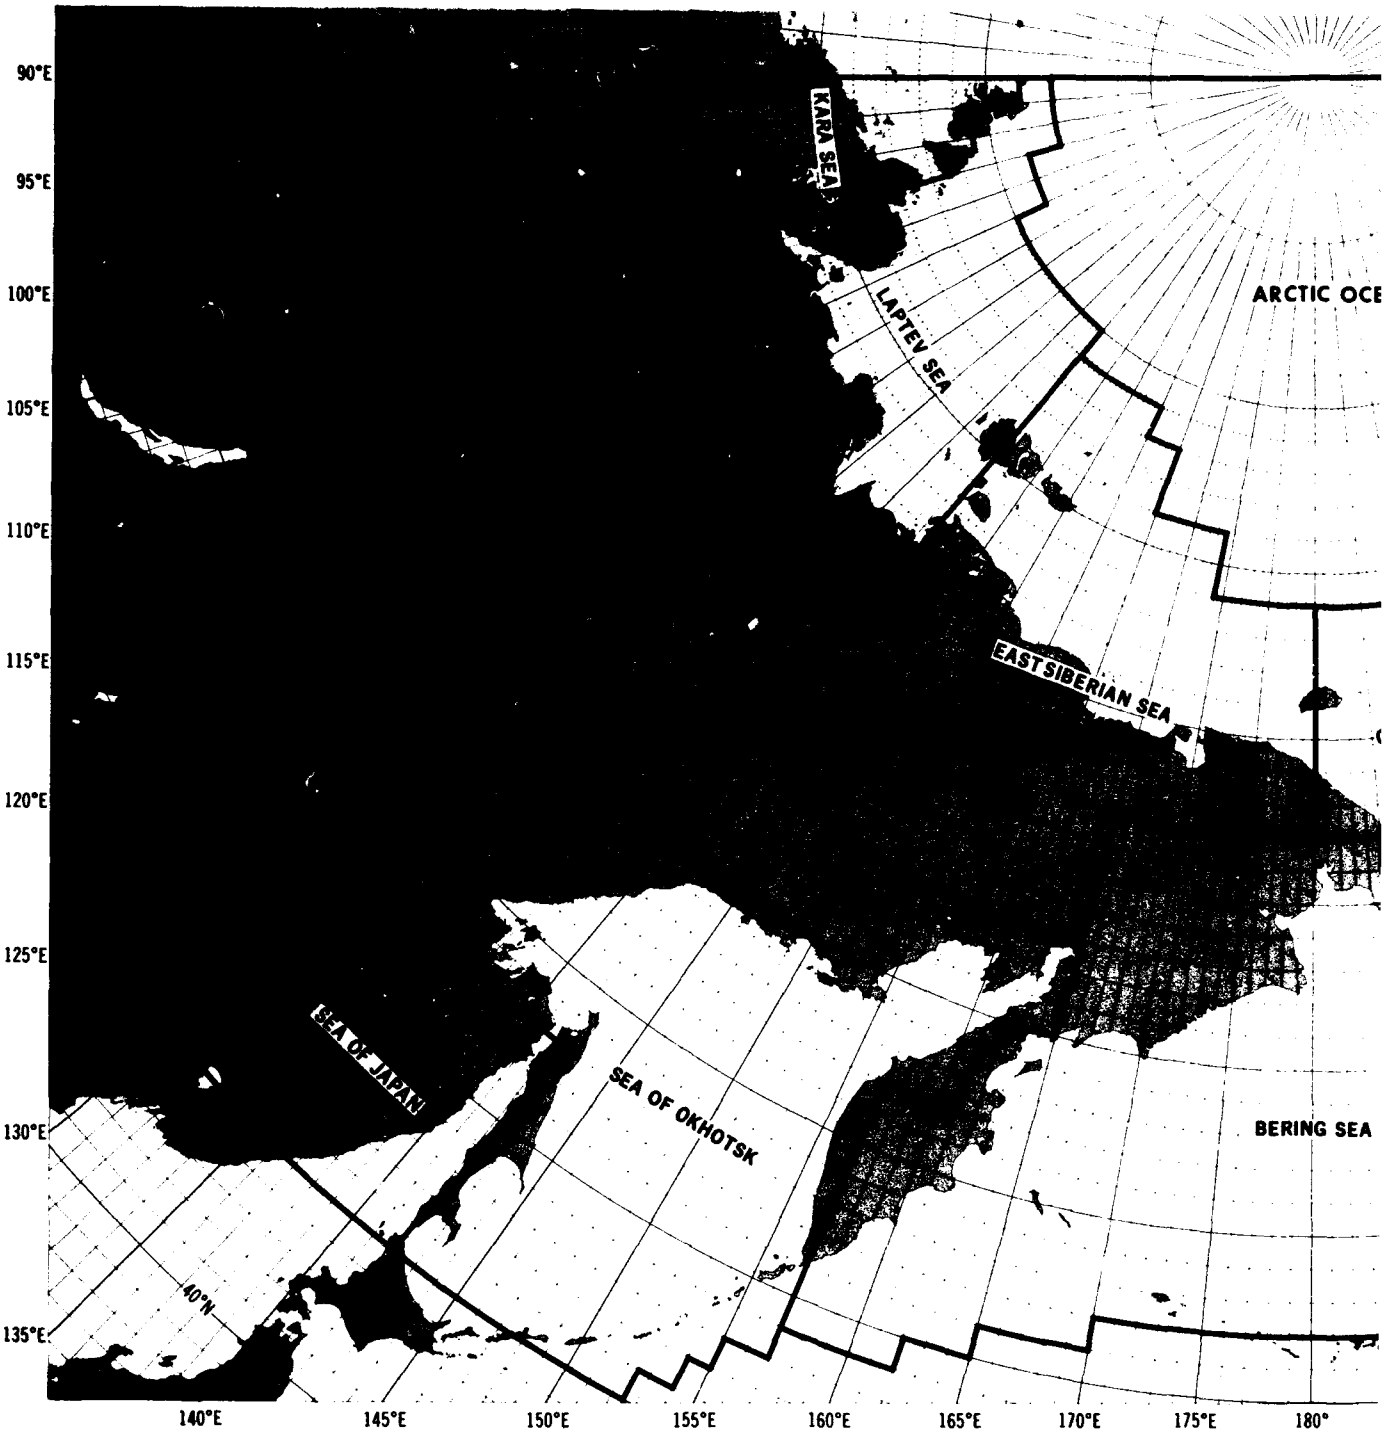

istics are presented for the entire Arctic West
sub areas (see Figure below). The first thirteen
chart that was digitized. The second set of
posite data centered on the first and fifteenth of

thirteen figures showing the time-series of total
re Arctic West and each of the twelve sub areas
