13. ABSTRACT (Maximum 200 words) This report continues the documentation of the operation of TMA/Eberline's Segmented Gate System technology for removing mixed plutonium and americium contamination at DNA's Johnston Atoll site. Contaminated feed is conveyed under arrays of radiation detectors coupled with sophisticated computer software developed by Eberline Instrument Corporation. Segmented gates (chutes) on pneumatically-driven pistons move forward when contamination is detected to remove only the contaminated portion from the main flow of feed material. Only about one pint of contaminant is removed during each diversion event. At the JA site, a 98% volume reduction has been achieved, with the remediated soil cleaned to DNA's criteria for release for unrestricted use of 500 Bq/kg total transuranic alpha contamination and no "hot" particles of greater than 5000 Becquerels. The low level waste concentrate is expected to be packaged for shipment to an approved defense waste disposal site.

SECTION 1
INTRODUCTION

1.1 GENERAL.

This summary report covers an extension of DNA Contract DNA001-90-C-0119 during the period from 1 June 1993 to 5 August 1993. This report presents the results of additional plant modifications and completion of construction of sorter conveyor systems 3 and 4, and the data pertaining to soil processing during the period.

1.2 TECHNICAL OBJECTIVE.

The primary objectives during the extension period were to complete construction of sorter conveyor systems 3 and 4 and to continue to process plutonium contaminated soil when modifications or construction was not being performed.

Prior to the start of the extension period, major construction of sorters 3 and 4 began in January 1993. Most of the conveyor systems had been fabricated and emplaced, and installation of the detector systems had been started, however, testing, calibration and electrical system check-outs had not been performed. Additionally, Version 1.11 of the JACC system software was to be installed and tested, remaining electronic components for detector systems were to be procured and installed, and belt weigh scales for both units 3 and 4 had to be installed and calibrated.

SECTION 2

EXTENSION PERIOD MAINTENANCE AND MODIFICATION OPERATIONS

2.1 PLANT MODIFICATIONS.

At the start of the extension period, soil production was halted as primary emphasis was devoted to completion of units 3 and 4 and plant maintenance.

The majority of the on-island TMA/E staff went on rotation during the period 24 May 1993 to 10 June 1993. During the period 7 to 10 June, TMA/E staff consisted of Mr. Bob Dakin, electrical engineer, Mr. Jim Woods and Mr. Ken Murphy, electronics technicians, and Mr. Dave Lawrence, health physics technician.

During the week of 20 June 1993, JACC version 1.11 software was installed on units 1, 2 and 4. Particle and distributed efficiencies were calculated and completed. Unit 3 was not on-line due to shortages of detector electronics boards and a master controller board.

Two belt weigh scales were installed on units 3 and 4 and the hardware and wiring for a third scale was installed should a convertor for diverted soil be installed. Replacement parts for the weigh scales' electronics had to be secured from the manufacturer, and the scales were calibrated, tested and placed in an operational status. Additionally, the mass flow meter was returned to the factory for repairs and subsequently installed and calibrated.

The segmented gates on units 3 and 4 operate exactly opposite than those on units 1 and 2, in that the gates on units 3 and 4 remain extended during operation and retract to trap the hot particle. This mode of operation caused excessive "splatter" of soil when hitting the gates and engineering changes were made to reduce excessive dust and soil bouncing off the gates. This consisted of installing belt wiper material behind the gates which reduced the dust and soil bounce off the gates.

During the week ending 1 August 1993, modifications and construction was completed on units 3 and 4. Minor modifications to dust misting systems and installation of grizzly conveyor covers remain to be accomplished pending receipt of on-order materials and parts.

2.2 PLANT MAINTENANCE.

In addition to modifications to units 3 and 4, corrosion control and scheduled maintenance were performed on units 1 and 2. Units 1 and 2 grizzly feed belt was damaged and had to be replaced and cracks in the frame were repaired and welded. Other maintenance and repairs were performed to units 1 and 2 as follows:

- a) Installed new grizzly belt skirting and performed adjustments.
- b) Adjusted the screen belt and screen belt skirting.
- c) Installed required weights on vibrating screen shaft.
- d) Adjusted tail pulley skirting on sorter feed.
- e) Cleaned and lubricated complete system.
- f) Adjusted skirting on sorter 1 and 2.
- g) Repaired abrasions and holes on unit 2 belt.
- h) Adjusted skirting and tail pulley on clean belt and day bin.
- i) Installed water misting system on clean stacker.

SECTION 3

SOIL PROCESSING OPERATIONS

3.1 GENERAL.

Soil production continued during the extension period when construction and modifications to units 3 and 4 were halted. Primary production continued with units 1 and 2 and limited production was conducted on unit 4 due to construction.

3.2 PLANT PRODUCTION.

Soil processing was accomplished on 30 days during the extension period. Units 1 and 2 processed soil on a total of 29 days, and unit 4 processed soil on 2 days. Unit 3 did not process soil during this period due to shortage of a master control board and detector boards in its detector box. Figure 3-1, JA SOIL CLEANUP PLANT LOG OVERALL SUMMARY REPORT-COMBINED SORTERS, depicts the daily processed mass in metric tons, cumulative production, weight reduction, and time utilization during the extension period.

Cumulative production during the extension period totaled 5,321 metric tons (Clean + Diverted). Clean soil produced totaled 5,291 metric tons and diverted soil total was 29.44 metric tons.

Weight reduction during the 30 days of processing was 99.5%. The range was from 97.1 to 99.1.

The primary objective during the extension period was to complete construction on units 3 and 4 and production was second. In view of the construction activities by TMA/E, time utilization as it pertains to soil production was an excellent average of 77.4% production rate. Non-availability time as it pertains to production was primarily due to required plant modifications.

Table 3-1. JA soil cleanup plant log overall summary report-combined sorters.
