13. ABSTRACT *(Maximum 200 words)*

The purpose of the Remedial Investigation/Feasibility Study Report is to provide a comprehensive description of Kotzebue LRRS, including the installation's operational history and environmental setting; a summary of past IRP investigations at the site; a detailed description of the 1994 remedial investigation; a site conceptual model integrating available site information; and site-specific summaries and recommendations. This document also incorporates a feasibility study which identifies cleanup objectives, evaluates various remedial action alternatives, and recommends appropriate actions to meet cleanup objectives.

APPENDICES

APPENDIX A. SOIL BORING LOGS

APPENDIX B. WELL COMPLETION DIAGRAMS

APPENDIX C. WELL AND SAMPLE LOCATION SURVEY DATA

APPENDIX D. AQUIFER TEST DATA

APPENDIX E. GEOTECHNICAL DATA REPORT

APPENDIX F. GRADIOMETRIC SURVEY DESCRIPTION

APPENDIX G. FIELD QA/QC REPORT

APPENDIX H. ON-SITE LABORATORY AUDIT REPORT

APPENDIX I. 5% RAW LABORATORY DATA AUDIT REPORT

APPENDIX J. SAMPLE CHAIN-OF-CUSTODY

APPENDIX K. QUALITY ASSURANCE REPORT

APPENDIX L. ANALYTICAL DAT SUMMARY

APPENDIX A – SOIL BORING LOGS

TETRA TECH

GEOLOGIC LOG OF SOIL BORING
Background-SB1

PROJECT: Kotzebue LRRS Remedial Investigation
CLIENT/OWNER: AFCEE/USAF
TETRA TECH PROJECT NUMBER: 9676-13
EXPLORATION NUMBER: Background-SB1
START DATE: 27 June 1994 HOUR: 1200
GROUND SURFACE CONDITIONS: Beach Gravel
CORRESPONDING WELL DESIGNATION: Background-MW1

CONTRACTOR REPRESENTATIVE: David R. Hose
EXPLORATION CONTRACTOR: Ambler Exploration
OPERATOR: Steve Moore
DRILL TYPE/METHOD: Track-Mounted Hollow Stem Auger
HAMMER WEIGHT & STROKE: 140 lbs./30 inches
AUGER SIZE: 4.25" I.D., 7.0" O.D., 8.0" O.D. Bit

WATER LEVEL INFORMATION
DATE: 27 June 1994 TIME: 1330
DEPTH OF WATER: 7.3 feet below ground surface
(first encountered)

Sample Number/ Analysis/Depth	PID Response Over Background	Blow Count per 6-in Interval ___/___/___	Recovery (inches)	Depth (feet)	Lithology	Description/Comments
Background-SB1-0.5 (Pest./PCB)				0		
				1		
				2		
	NA	5/7/14	9/18	3	GW	Drive 2.5 - 4.0 ft. Top of core is sandy GRAVEL (GW), brown, sand medium to coarse grained, gravel pea sized to 3/4 inch diameter, well graded, medium dense, moist, angular to sub angular. Lower 6 inches of core is silty SAND (SW), brownish gray, sand fine to very coarse grained, well graded, medium dense, moist, subangular to subrounded. No odor or staining.
				4	SW	
	NA	8/14/12	0/18	5	GW	Drive 5.0 - 6.5 ft. Sandy GRAVEL (GW), no core recovery. No odor.
				6		
				7		
Background-SB1-7.5 (TPH)	NA	47/54//57	18/18	8		Drive 7.5 - 9.0 ft. Sandy GRAVEL (GW), brown, sand medium to coarse grained, gravel to 1-1/2 inch diameter, well graded, dense, wet and frozen, angular to subrounded. No odor or staining.
Background-SB1-9.0 (VOCS)				9		
	NA	29/39/41	12/18	10		Drive 10.0 - 11.5 ft. Sandy GRAVEL (GW), same as above. No odor or staining.
Background-SB1-11.0 (SVOCS)				11		TOTAL DEPTH OF BORING: 11.0 ft. below ground surface

NA = PID not available

FINISH DATE: 27 June 1994 HOUR: 1600

DEPTH OF WATER: 7.0 feet below ground surface
(first encountered)

Sample Number/ Analysis/Depth	PID Response Over Background	Blow Count per 6-in Interval ___/___/___	Recovery (inches)	Depth (feet)	Lithology	Description/Comments
	0	3/6/8	11/18	3	GW/ ML	Drive 2.5 - 4.0 ft. Sandy GRAVEL (GW) with silt, olive tan (2.5Y 4/3), with rust staining, bimodal, fine sand, gravel to 1 inch diameter, well graded, polymict, medium dense, dry, rounded. Contains interbedded sandy SILT (ML), gray (2.5Y 6/1), moist, and PEAT, dark reddish brown (5YR 2.5/2), moist. No odor or staining.
	0	3/9/14	8/18	4	GW	Drive 4.0 - 5.5 ft. Sandy, silty, GRAVEL (GW), black (2.5Y 2.5/1) to olive brown (2.5Y 3/2), predominantly pea gravel with fine to coarse sand, well graded, polymict, medium dense, dry, rounded, minor organics, some iron staining. No odor or staining.
	5.1	11/16/16	12/18	6	GP	Drive 5.5 - 7.0 ft. Silty sandy GRAVEL (GP), olive brown (2.5Y 4/3), coarse gravel to 1 inch diameter, poorly graded, indistinct bedding (sorting on ~ 3 inch intervals), polymict, dense, slightly moist to moist, rounded. Thin silt layers between sand and gravel lenses.
ST05-SB10-7.0 (VOCS)						
	12	15/64/90	15/18	7		Drive 7.0 - 8.5 ft. Sandy GRAVEL (GP), gray (2.5Y 5/1) to light gray (2.5Y 6/1), predominantly coarse sand and pea gravel, poorly graded, polymict, very dense, moist to frozen, rounded. Some intermittent silts as thin interrelations. Some sorting, bedding on ~2 - 3 inch thick layers. Some layers are well graded with 1 - 2 inches of washed gravels with fewer fines. Distinct petroleum odor.
ST05-SB10-8.5 (SVOCS + TPH)				8		TOTAL DEPTH OF BORING: 8.5 ft. below ground surface

	60	6/8/11	14/18	0–2	SW	Drive 1.0 - 2.5 ft. Gravelly SAND (SW), dark reddish gray (2.5YR 5/1), sand coarse, gravel pea sized, well graded, medium dense, moist, subangular to rounded, massive, minor silts and fines. Moist organic rich soil horizon with weed and grass roots developed on the top of core. Distinct petroleum odor. No staining.
	85	5/8/11	10/18	2–4	SW / GW	Drive 2.5 - 4.0 ft. Upper 4 inches is gravelly SAND (SW), gray (7.5YR 5/1), sand fine to medium, gravel 1/2 to 1 inch diameter, well graded, medium dense, dry, subangular to rounded. Below is sandy GRAVEL (GW), dark gray (7.5)YR 4/1), well graded, polymict, medium dense, dry, well rounded. Distinct petroleum odor. No staining.
	376	4/6/7	8/18	4–5	GW	Drive 4.0 - 5.5 ft. Sandy GRAVEL (GW), dark gray (7.5YR 4/1), moderately graded, polymict, medium dense, wet, rounded. Strong petroleum odor and black staining in lower 2.5 inches.
ST05-SB13-5.5 (SVOCS)						
	1,257	4/7/11	12/18	5–6	GW	Drive 5.5 - 7.0 ft. Sandy GRAVEL (GW), very dark gray (7.5YR 3/1), sand coarse, gravel to > 1 inch diameter, well graded, medium dense, wet, predominately rounded to subrounded, trace of fines. Top 12 inches is organic rich Obvious petroleum odor and staining.
ST05-SB13-6.0 (VOCS)						
ST05-SB13-7.0 (TPH)	376	5/40/60	14/18	7–8	SP	Drive 7.0 - 8.5 ft. Gravelly SAND (SP), gray (2.5Y 5/1), moderate to poorly graded, sand is fine to medium grained, gravel is predominately pea size with some to 1/2 inch diameter, polymict, very dense, wet, well rounded. Becomes more sandy at the base, with ~ 10% fines. Some minor shell fragments. Frozen ground at 7.5 ft based on blow counts, likely seasonal. Slight petroleum odor, no staining.
	148	26/21/13	10/18	8–10	GW	Drive 8.5 - 10.0 ft. Sandy GRAVEL (GW), upper 4 inches is very dark gray/black (N3) from petroleum staining, below is dark gray (2.5Y 4/1), sand coarse grained, gravel pea sized to coarse, well graded, dense, frozen, rounded to well rounded, minor silt (<10%). Slight petroleum odor.

DEPTH OF WATER: 5.0 feet below ground surface
(first encountered)

Sample Number/ Analysis/Depth	PID Response Over Background	Blow Count per 6-in Interval __/__/__	Recovery (inches)	Depth (feet)	Lithology	Description/Comments
	5.4	2/3/4	6/18	0–3	GW	Drive 2.5 - 4.0 ft. Sandy GRAVEL (GW), very dark gray (2.5Y 3/1), primarily coarse sand, gravel pea sized, well graded, loose, moist, well rounded. Some shell fragments and minor fines. Petroleum odor is evident, no staining.
ST05-SB17-5.0 (VOC + TPH)	256	4/9/20	2/18	4–5	SP	Drive 4.0 - 5.5 ft. Silty, gravelly SAND (SP), sand fine to coarse grained, gravel to pea size, poorly graded, bedding present (1 to 2 inch thick bedding layers), medium dense, moist to wet, coarsens downward. Frozen below 5.0 ft. Strong petroleum odor, and dark petroleum staining.
ST05-SB17-6.5 (SVOCS)	~57	4/11/60	11/18	5–7	GW / SP	Drive 5.5 - 7.0 ft. Sandy GRAVEL (GW), sand coarse grained, gravel pea sized, well graded, well rounded. Strong petroleum odor, but no staining. Below 6.0 ft grades into SAND (SP), gray (5Y 4.1/1), sand coarse grained, poorly graded, minor fine sand, silt, and shell fragments. Bottom 2 inches of core is sandy GRAVEL (GW), well graded, with minor silt.
ST05-SB17-10.0 (TPH)	~27	33/67/105	11/18	7–10	GW / SW	Drive 9.0 - 10.2 ft. Upper 2 inches is silty, sandy GRAVEL (GW), dark gray brown (2.5Y 3.5/2), sand fine to medium grained, gravel to 1 inch diameter, bimodal, moderately well graded, very dense, rounded. Entire core is frozen. Below 9.5 ft becomes a gravelly SAND (SW), sand very fine to medium grained, gravel pea sized, well graded. Very slight petroleum odor and some staining.

PROJECT: Kotzebue LRRS Remedial Investigation
CLIENT/OWNER: AFCEE/USAF
TETRA TECH PROJECT NUMBER: 9676-13
EXPLORATION NUMBER: AOC4-SB7
START DATE: 26 July 1994 HOUR: 1017
GROUND SURFACE CONDITIONS: Gravel Fill
CORRESPONDING WELL DESIGNATION: NA

CONTRACTOR REPRESENTATIVE: Rick Osgood PG / Kurt Schmierer PG
EXPLORATION CONTRACTOR: Ambler Exploration
OPERATOR: Steve Moore
DRILL TYPE/METHOD: Track-Mounted Hollow Stem Auger
HAMMER WEIGHT & STROKE: 140 lbs. / 30 inches
AUGER SIZE: 2.25" I.D., 5.0" O.D., 5.0" O.D. Bit

WATER LEVEL INFORMATION
DATE: 26 July 1994 TIME: 1145
DEPTH OF WATER: not encountered
(first encountered)

Sample Number/ Analysis/Depth	PID Response Over Background	Blow Count per 6-in Interval __/__/__	Recovery (inches)	Depth (feet)	Lithology	Description/Comments
				0		
				1		
				2	Fill	
	0	8/15/19	16/18	3		Drive 2.5 - 4.0 ft. Above 3.5 ft is silty GRAVEL (Fill), dark gray (N3.5), ~ 30% silt binding gravel (65%), well graded, medium dense, slightly moist, gravel angular (broken) to rounded. Below 3.5 ft is sandy GRAVEL (GW), very dark gray (2.5Y 3.5/1) predominately fine to medium sand, some coarse sand (sand ~ 35%), gravel 1/2 to 3/4 inch diameter, no granules or pea gravel, well graded, dense, slightly moist, rounded, bimodal. No odors or staining.
				4	GW	
	0	2/3/5	12/18		SW	Drive 4.0 - 5.5 ft. Well bedded. Upper 0.2 ft is SAND with gravel (SW), dark gray (2.5Y 4/1), sand fine to coarse grained, pea gravel to ~ 1/2 inch diameter, well graded, slightly moist, well rounded except fine to medium sand is subangular. Next 0.1 ft is Woody PEAT (OL/OH), 100% organic, no sediment, organic odor. No odors or staining. Next 0.3 ft is silty CLAY (CL) with very fine sand, dark olive gray (5Y 3/2), ~ 35% silt, medium stiff, moist, moderately plastic. Bottom 0.1 ft is sandy SILT (ML) with some clay, very dark brown (10YR 2/2), minor organics and fine root hairs. No odors or staining.
				5	CL	
					ML	
	0	11/14/21	18/18		OL/ OH	Drive 5.5 - 7.0 ft. Core is frozen below 6.3 feet. Upper 0.4 ft is TUNDRA MAT (OL/OH), reddish black (2.5YR 2.5/1), 100% organics, no sediment. Below 6.0 ft is gravely SILT (ML), mottled olive gray (5Y 3.5/1.5) with brown, tan, and reddish streaks along bedding planes, friable with abundant very find sand size particles that reflect light (mica). Gravel poorly graded, size to 1-1/4 inches diameter, rounded. Some streaky mottling looks like iron staining. No odors or staining..

					GW	
SS12-SB27-7.5 (VOC) SS12-SB27-7.8 (SVOCS + TPH)	288	4/15/20	18/18	7	OL/OH	Drive 7.0 - 8.5 ft. Top 1-1/2 inch of core is sandy GRAVEL fill (GW), grayish brown (10YR 4.5/2), ~10% sand and fines, gravel is coarse grained to 1-1/4 inch diameter, rounded, dense, wet. Visibly contaminated transition zone near top of sample. Next 2 inches of core is woody PEAT (OL/OH), very dusky red (2.5YR 2.5/2.5) and black (N2.5), obvious petroleum staining, wet, tundra mat. The remainder of the core is a Sandy, clayey SILT (ML), grades downward from black (N2.5) to dark olive gray (2.5Y 4/1), massive, wet, not plastic. Black color is staining from petroleum contamination. Bottom few inches appears uncontaminated. Sampler cold, so near frozen ground.

APPENDIX F – GRADIOMETRIC SURVEY DESCRIPTION

GRID DESCRIPTIONS FOR GRADIOMETER SURVEY
Kotzebue LRRS Site
SS-02 Waste Accumulation Landfill
Survey Date 6/21/94

GRID POINTS	NOTES
A1-A4	Surface is gravel pad, no visible waste or staining, no metallic waste detected
A5	Surface gravel and grass cover, stained soil, minor metallic surface debris
A6-A8	Grass cover, no staining, surface debris, no buried metallic waste
A9	Buried metallic waste
A10-A11	Excavated pit with small quantity of standing water, surface debris
A12	Grass cover, buried metallic waste
A14-A15	Excavated Pit, no water
A16	Grass cover, no staining, no surface debris or buried metallic waste
A17	Grass cover, buried metallic waste
A18-A20	Grass cover, some minor surface debris
A21-A23	Grass cover, minor surface debris
A24-A25	Edge of excavated pit, minor surface debris
A26	Grass cover, buried metallic material (one location)
A27	Grass cover and gravel, no staining, surface debris
A28	Grass cover and gravel, no staining, surface debris, buried metallic waste
A29-A31	Gravel and grass cover, no staining, no surface debris

GRID POINTS	NOTES
A32	Gravel and grass cover, no staining, no surface debris, buried metallic waste
A33-A36	Gravel and grass cover, no staining, no buried metallic waste
A37-38	Nothing found
A39	Buried metallic waste (one location)
A40-A43	Minor metallic debris both surface and buried
A44	Shrubs and grass cover, buried metallic material
A45-A48	Shrubs and grass cover, minor surface debris
B1-B4	Gravel surface, some surface staining, minor metallic debris both surface and buried
B5-B9	Grass cover, minor surface debris
B10-B11	Excavated pit with buried metallic material at eastern edge
B12	Large mass of buried metallic debris
B13	Nothing found
B14-B15	Excavated pit, no water, no metallic waste
B16	Grass cover, nothing found
B17	Grass cover, buried metallic waste (one location)
B18-B23	Grass cover, minor metallic surface debris
B24	Excavated pit, no water, nothing found
B25-B26	Grass cover, nothing found
B27-B28	Grass cover, large volume of buried metallic waste
B29-B32	Gravel surface, no metallic material
B33	Low area of stained soil
B34-B35	Mound of gravel, no staining, minor surface debris
B36-B39	Gravel surface, nothing found

GRID POINTS	NOTES
B40-B44	Shrub cover, minor surface debris, small scattered bodies of buried metallic waste
B45-B46	Tall shrub cover, drums, metallic surface debris and buried metallic waste in mound
B47-B48	Tall shrub cover, nothing found
C1	Gravel surface, minor surface debris, stained soil
C2-C4	Gravel surface, minor surface debris
C5-C6	Grass cover, nothing found
C7	Grass cover, buried metallic waste, one visible drum
C8-C10	Grass cover, visible drums, black tar present on surface, large volume of buried metallic objects
C11-C13	Grass cover, small mounds present, metallic surface debris, buried metallic waste
C14-C15	Excavated pit, buried metallic waste
C16-C17	Grass cover with some bare soil, buried metallic material
C18	Large buried metallic mass
C19-C21	Grass cover, buried metallic objects
C22-C23	Grass cover, nothing found
C24-C25	Excavated pit, standing water
C26-C28	Grass cover, buried metallic waste, dog team present
C29-C32	Gravel surface, nothing found, dog team present
C33	Low spot with rust-stained soil, buried metallic waste
C34	Gravel mound, minor metallic debris both surface and buried
C35-C38	Surface debris, buried metallic waste

GRID POINTS	NOTES
C39-C41	Grass and Shrub cover, small mounds present, buried metallic waste
C42-C45	Shrub and grass cover, metallic surface debris, small volumes of buried metallic waste
C46	Shrub cover, drums visible, large volume of metallic waste
C47-C48	Shrub cover, nothing found
D1	Gravel surface, stained soil, minor metallic surface debris
D2-D3	Gravel surface, minor metallic surface debris, buried metallic waste at eastern edge of cell
D4	Gravel surface, minor metallic surface debris
D5-D7	Grass cover, minor amounts of metallic surface and buried debris, drum visible
D8-D9	Grass cover, buried metallic waste
D10	Excavated pit, metallic surface debris in pit (drums, food cans, pipe, etc.), car batteries
D11-D12	Excavated pit, metallic surface debris in pit (drums, food cans, pipe, etc.)
D13-D14	Grass cover, nothing found
D15	Excavated pit, metallic waste buried in pit
D16-D19	Grass cover, metallic surface debris, scattered bodies of buried metallic waste
D20	Grass cover, Small mounds containing buried metallic waste, visible drum
D21-D22	Grass cover, Small mounds containing buried metallic waste
D23-D25	Excavated pit with standing water
D26	Gravel and Grass cover, buried metal waste, dog team present
D27-D32	Dog team present

GRID POINTS	NOTES
D33-D34	Grass covered mounds, metallic surface debris, buried metallic waste
D35	Grass covered mounds, metallic surface debris, buried metallic waste, visible drum
D36	Grass covered mounds, metallic surface debris, large body of buried metallic waste
D37-D40	Grass and shrub cover, metallic surface debris, buried metallic waste
D41-D42	Shrub cover, metallic surface debris, buried metallic waste
D43	Shrub cover, metallic surface debris, buried metallic waste, visible drum
D44	Shrub cover, metallic surface debris, buried metallic waste, paint cans
D45-D46	Shrub cover, metallic surface debris, buried metallic waste
E1-E2	Gravel surface, buried drums and asphalt waste
E3-E4	Gravel and grass cover, metallic surface debris, buried metallic waste
E5	Shrub cover, buried metallic waste
E6-E8	Grass and shrub cover, nothing found
E9-E11	Small grass covered mounds, buried metallic waste
E12-E13	Grass cover, nothing found
E14-E15	Excavated pit, buried metallic waste in pit
E16-E23	Small grass covered mounds, minor surface debris, buried metallic waste, mounds scattered
E24	Excavated pit, no water
E25-E32	Shrub cover, assorted surface debris
E33-E36	Grass covered mounds containing large buried metallic objects

GRID POINTS	NOTES
F1-F4	Buried drums with asphalt waste
F5-F16	Assorted surface debris, scattered buried metallic waste
F36	Grass covered mounds, visible drums, buried metallic waste
F37	Grass covered mounds, buried metallic waste
F38	Grass covered mounds, visible drums, buried metallic waste
G2	Grass covered mound, buried metallic waste
G10	Grass covered mound, buried metallic waste

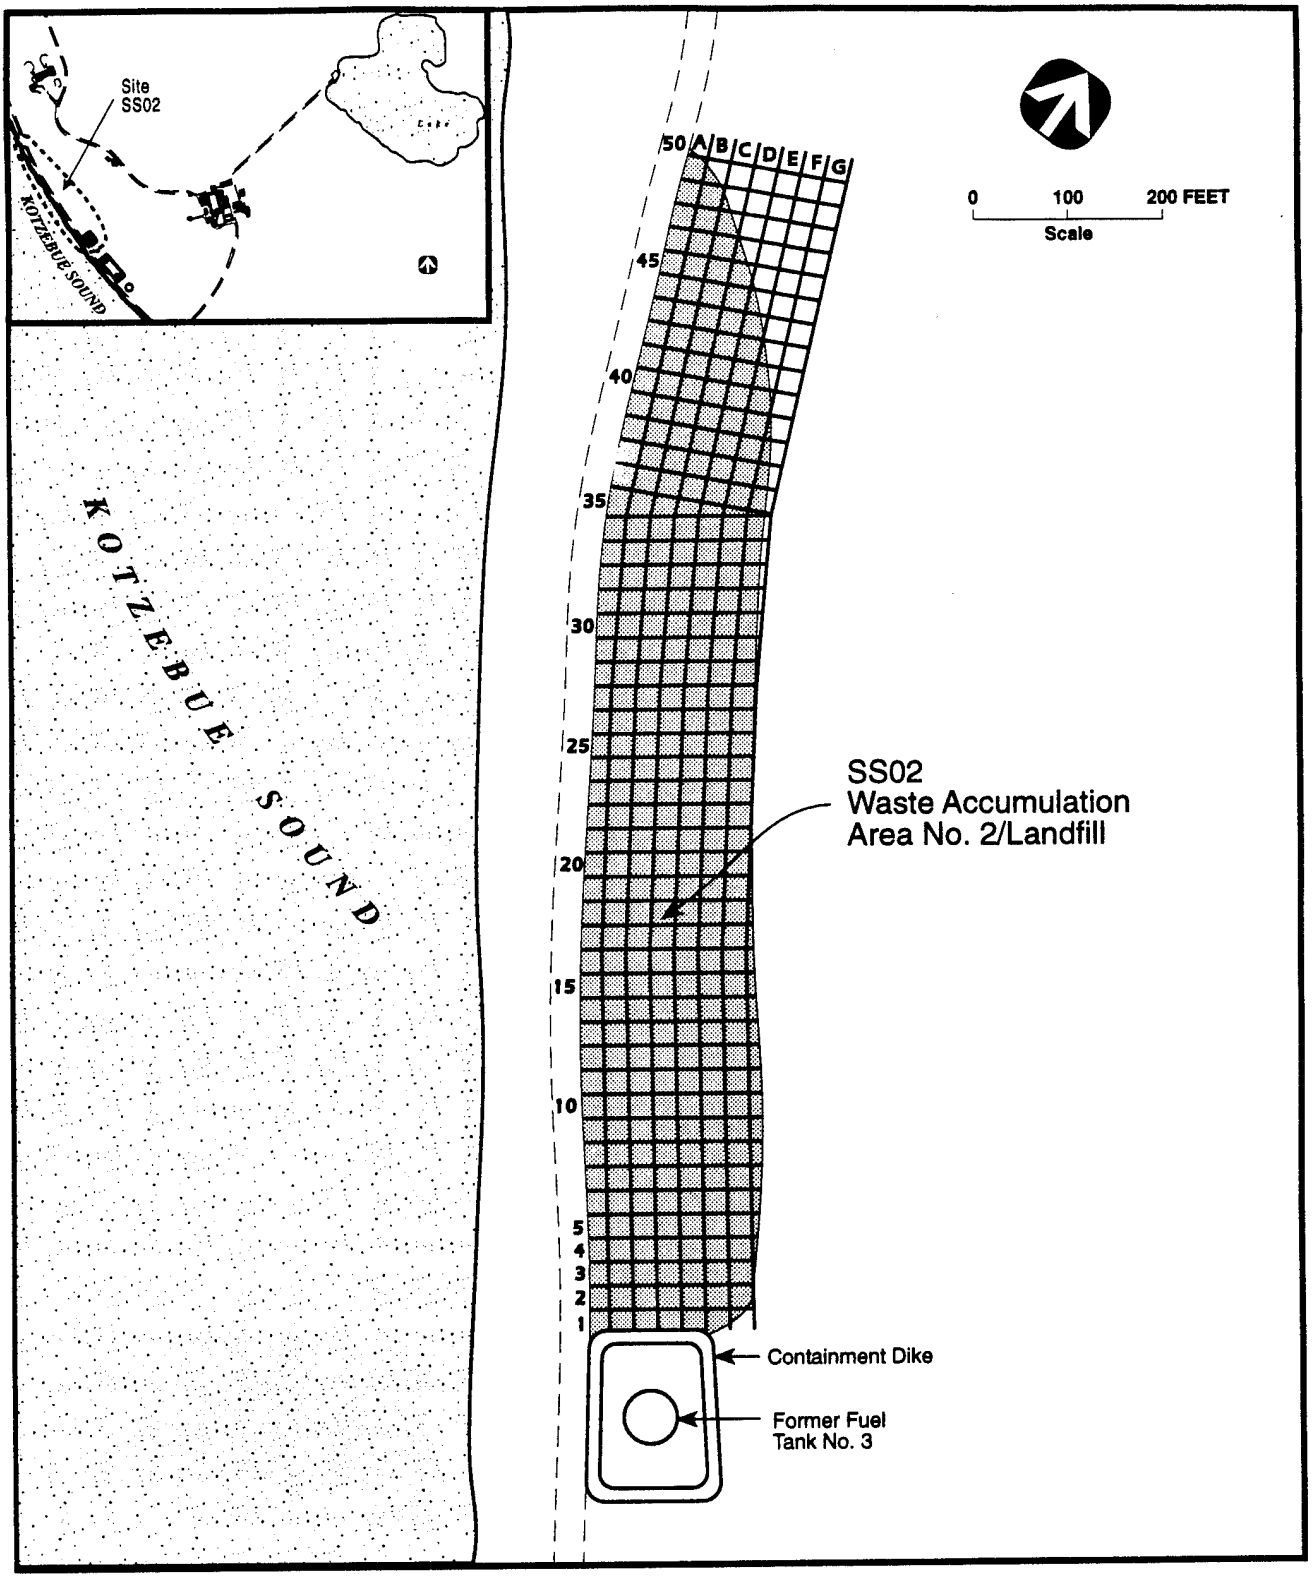

Figure 2-2. Survey Grid as Constructed for Gradiometric Survey at SS02 Waste Accumulation Area No. 2/Landfill, Kotzebue LRRS, Alaska.

APPENDIX G – FIELD QA/QC REPORT

TETRA TECH, INC.
348 West Hospitality Lane, Suite 300
San Bernardino, CA 92408-3216
Telephone (909) 381-1674
FAX (909) 889-1391

TO: Mr. Rick Osgood, Project Manager **DATE:** 09 August 1994

FROM: Arlen Saxton, Field Auditor, QA **APPROVAL**

SUBJECT: Various Field QA Audits of Kotzebue LRRS, Alaska and Field Audit of Hand-Auger Soil Sampling and Sediment Sampling at Site 2212, Spills 2 and 3.

DATE: 12 July 1994 **TIME:** 1045

CREW: Kurt Schmierer, Tetra Tech; Steve Moore, Ambler Exploration; Rob Helton, Ambler Exploration

OBSERVATIONS:

All soil sampling equipment was deconned at end of day prior to the sampling day, and wrapped in oil-free aluminum foil (split-spoon, brass sleeves, stainless steel bowls, and spoons and trays). All equipment was calibrated prior to mobilizing to drilling site. Worksite set up at an up-wind location from drillers. Mr. Kurt Schmierer is a registered geologist supervising the site. 2 1/2-inch ID hollow-stem auger was used. First sample at 2 1/2 feet to 4 feet. Split-spoon sampler prepared by Mr. Kurt Schmierer. No. SW8260 will be taken, so no brass sleeves were used. PID reading taken as sleeve was examined. Sample containers were prelabeled prior to filling. Blow counts were recorded by Mr. Kurt Schmierer. A 140-pound free-falling hammer was used to drive the split-spoon (fall of 30 inches). The split-spoon was delivered by Mr. Rob Hilton, of Ambler Exploration, to Mr. Schmierer. The sample was opened by Kurt Schmierer. The sampler was placed in an oil-free aluminum foil covered stainless-steel pan prior to opening. This sample was not selected for analysis.

Next spoon was driven 4.5 feet to 6 feet. Mr. Rob Hilton deconned his gloves between each split-spoon sampling event. This will be used to collect a TPH sample. No brass sleeves were used as no SW8260 samples were taken. The sample in the spoon was opened to take a PID reading. Sample recovery was recorded by Mr. Schmierer in the Log Book. TPH sample was placed into the cooler immediately after collection. No other analyses will be performed at this location. Lithologic characteristics were recorded in the log book by Mr. Schmierer. All sample information was recorded in the log book by Mr. Schmierer. Sample was taken directly above water table. No other sample will be collected at this location; however, this hole will be further drilled for lithographic purposes, then abandoned in accordance with the QAPP, and characterization/observation of a clay defining layer will be performed by Mr. Kurt Schmierer. Please see the attached Environmental Soil Sampling Systems Audit Checklist.

Additional comments:

Shelby tube samples taken for geophysical properties only.

SUBJECT: Field Audit of Hand-Auger Soil Sampling and Sediment Sampling at Site 2212, spills 2 and 3.

DATE: 5 July 1994 **TIME:** 0900

CREW: Dave Hose, Randy Dyer

OBSERVATIONS:

All equipment was calibrated by Mr. Randy Dyer prior to sampling at the garage (storage) area. All sampling equipment was deconned prior to use. Procedures used followed manufacturer's guidelines and requirements in the FSP and QAPP. Samples were taken at Site SS12, spills 2 and 3. All sample locations were properly flagged by Mr. Dave Hose prior to sampling event. All samples were stored in a cooler with ice during continuing sampling. FSP was on hand during sampling. All analytes were double checked prior to moving to next site.

Perma frost was at a shallow depth, less than 6 inches. Many samples required multiple boreholes. Samples were collected using a hand auger. A hand-operated core sampler with a 6-inch brass sleeve was attempted; however, it proved impractical, and an undisturbed sample was unobtainable. A hand auger was used instead. The samples were collected in the following order: SW8081, SW8270, SW6010, and SW7421. A new auger was filled to collect the SW8260 sample immediately above the water line.

CONCLUSIONS AND RECOMMENDATIONS:

The soil sample for SW8260 originally were to be collected in a 6-inch brass sleeve. However, this proved not possible. A 1 1/2-oz. glass VOA soil bottle was used. Care was taken to disturb the sample as little possible. However, some disturbance of the samples did occur; this was unavoidable. The soil sampling using a hand auger produced acceptable samples. The SW8260 soil sample from the hand auger has the possibility of reading low in any analytical results due to the limited disturbance of the samples.

ENVIRONMENTAL SOIL SAMPLING
SYSTEMS AUDIT CHECKLIST

Contract: 7000 Date: July 5, 1994

Site: Kotzebue LRRS Auditor: Arlen Saxton

Yes	No	Comments	Operation
			PRESAMPLING OPERATIONS
✓		Hand-Auger Soil Sample	1. Sample type? (specify)

✓			7. Sample containers properly labeled?
	✓	Sampling event takes approximately 20 minutes. PID measurements taken after and during hand augering and recorded on the FDS.	8. OVA measurements taken and recorded prior to sampling and every 30 minutes during sampling?
			POST-SAMPLING OPERATIONS
✓			1. Decontamination performed according to current procedure? (Soap, potable water, Type II, reagent grade water, methanol, hexane.)
✓		See Record Keeping Audit	2. Sampling date, time, and location properly recorded in logbook?
✓			3. Suitable sample shipping container label used?
✓			4. Chain-of-Custody form filled out?
✓			5. Chain-of-Custody seal affixed to sample container?
✓			6. Refrigerated sample storage?
✓			7. Overall recordkeeping procedure adequate?

Additional comments:

* SW8260 samples collected using a hand auger. Limited disturbance of the sample will have occurred. Refer to the Conclusions section of this audit.

SUBJECT: Audit of Well Installation Activities at SS02 - MW2 Waste Accumulation Area #2/Landfill Area

DATE: 8 July 1994 **TIME:** 1300

CREW: Kurt Schmierer, Tetra Tech; Steve Moore, Ambler Exploration; Rob Hilton, Ambler Exploration

OBSERVATIONS:

All well construction materials were stored in manufactured boxes and in plastic sleeves. 0.01-inch slot size was used for this beach well. 20-40 sand was used as an artificial filter rack. Kurt is a registered geologist supervising the site. 4.25-inch hollow-stem auger, using standard drill and drive techniques were used. Screen and casing sections used have flush threaded "O" ring sealed joints. Potable water was used to break any bridges in the same pack. A variance was obtained to allow a minimum of 6 inches filter sand above the well casing. Well was surged to settle the sand. Variance was obtained to not use a tremie pipe due to shallow well depth. Filter pack dropped 3 inches after surging was produced. Bentonite chips were added and hydrated to form a seal. After Bentonite seal was hydrated, well was opened and surged to remove well construction sediments, prior to well head completion. Well as bailed dry.

The well was hard to construct due to very fine sand layer at the bottom of the well. Well casing was pushed down 2 inches through the fines to set well. Sand and Bentonite were poured from the top, due to shallow depth. A variance was obtained.

SUBJECT: Audit of Well Development Activities at ST05 - MW2, Beach Tank Area

DATE: 8 July 1994 **TIME:** 1000

CREW: Rick Osgood, Curtis DeGasperi

OBSERVATIONS:

PID taken when well was opened. Water level was taken and the total depth taken prior to surging. After bailing and purging 20 gallons, the first set of readings were taken. Readings were taken after every 5 gallons purged. Temperature, pH, specific conductance within specified parameters after four readings were taken. Turbidity unable to achieve less than 5 ntu. Section 3.1.4 of the FSP, pg. 48, allows that after 25 volumes, development may end. Well volume = .6 gal. - 30 gal. purged; final readings = pH 6.89; conductivity = 413 u/mho; temp. = 30°C; turbidity = 90 ntu; water level = 7.13; well depth = 11.54; final well volume = .16 gal. per foot, 2-inch well ID. All readings were stabilized, except turbidity.

CONCLUSIONS AND RECOMMENDATIONS:

As per the QAPP, the well is considered developed. Mr. Rick Osgood will, however, perform adequate purging, wastewater container volume permitting, prior to sampling to achieve an acceptable turbidity reading. Due to the logistical problems, unlimited purging is not possible to achieve ideal well development readings.

APPENDIX H – ON-SITE LABORATORY AUDIT REPORT

ON-SITE EVALUATION REPORT

ANALYTICAL RESOURCES, INC.
SEATTLE, WASHINGTON

22-25 March 1994

Principal Evaluators:	Dr. Garabed H. Kassakhian
	Ms. Stephanie J. Pacheco
Tetra Tech Observer:	Mr. Roderick A. Carr

ON-SITE EVALUATION REPORT
ANALYTICAL RESOURCES, INC.
SEATTLE, WASHINGTON
22-25 March 1994

Principal Evaluators:	**Dr. Garabed H. Kassakhian**	**(909) 381-1674 x221**
	Ms. Stephanie J. Pacheco	**(909) 381-1674 x275**
Tetra Tech Observer:	**Mr. Roderick A. Carr**	**(202) 883-1912**

The evaluation of Analytical Resources, Inc. (ARI) consisted of the following:

- A preaudit visit to ARI by Mr. R. Carr and Dr. G. Kassakhian (11 January 1994).
- On-Site Evaluation of the laboratory (22-25 March 1994).
- Review of a preaudit package that ARI submitted to the Air Force Center for Environmental Excellence (AFCEE) and Tetra Tech, Inc.

The evaluation was primarily focused on the soil and water analytical methods that will be used in AFCEE's upcoming Kotzebue Long Range Radar Station (Kotzebue LRRS) project in Alaska. These methods are:

Parameters	Method (W = Water; S = Soil)
Total Petroleum Hydrocarbons	E418.1
Total Organic Carbon	SW9060 Modified
Total Petroleum Hydrocarbons	SW5030/AK101 Gasoline
	SW3550/AK102 Diesel
	SW5030/8015 LUFT Gasoline
	SW3550/8015 M LUFT Diesel
Lead	SW7421 Modified
Mercury	SW7470(W); SW7471(S)
Arsenic	SW7060 Modified
Selenium	SW7740 Modified
Metals	SW6010
Organochlorine Pesticides & PCBs	SW3510(W)/SW3550(S)/SW8081 (cap. column)
Volatile Organic Compounds	SW5030(S)/SW8260(S/W)
Semivolatile Organic Compounds	SW3550(S)/SW3520(W)/SW8270

PART II

PREAUDIT PACKAGE REVIEW FOR ANALYTICAL RESOURCES, INC.

Reviewer: **Michael Wilson, Chemist, Quality Assurance, Tetra Tech, Inc. (909) 381-1674**
Review Dates: 17-18 March 1994

The Preaudit Package provided by Analytical Resources, Inc. (Seattle, Washington) was reviewed for analytical compliance to good laboratory practice and SW-846 QA/QC criteria. The package for this review consisted of four sections as listed below.

- Section 1: Method Detection Limit Study Results
- Section 2: Surrogate Standard and Spike Acceptance Criteria
- Section 3: Instrument Calibration Curves
- Section 4: Performance Evaluation Results

SECTION 1

This section consisted of the raw data for the Method Detection Limit (MDL) Study and a summary of these results. The raw data for the MDL studies performed are in accordance with the 40 CFR, Part 136, Appendix B document in which the Environmental Protection Agency (EPA) has established the MDL study criteria. The MDL studies in this package consisted of the following list for both water and soil.

- Polynuclear Aromatics (PNA) by High Performance Liquid Chromatography Method 8310
- Semivolatile GC/MS Compounds which are not labeled as to the method associated with the study but assumed to be Method 8270
- Volatile GC/MS Compounds which are unlabeled but assume to be Method 8240.
- Volatile GC/MS Compounds by Method 524.2
- Pesticides by Method 8080
- Total Petroleum Hydrocarbons (TPH) by Method 418.1
- Gasoline by Method 8015M
- BTEX by Method 8020

<GHK:dmc HAZ\K67-2345, 18 May 1994>

The MDL studies were found to be acceptable except for the following deficiencies:

- MDL studies reported without the method designation information (Methods 8240 and 8270).
- Method 8240 MDL shows Bromoform to be quantitated under the wrong internal standard.
- Several instances where the units associated with results are not indicated.

The Method Detection Limit Study Results Summary contains a draft document of the laboratory's proposed definitions for Detection, Reporting, and Quantitation (Attachment A). There is much confusion resulting from the use of the "Reporting Detection Limit" and its relationship to the MDL as described in the draft document.

It appears that the "Reporting Detection Limit" is an artificial estimation of the MDL based on how the lab feels the true MDL should be and ***is not experimentally derived.*** **The rationale for the Reporting Detection Limit appears to be totally subjective and without any scientific evidence to support its existence and no justification for its use has been found in SW-846.** In light of these facts and in order to be consistent with good laboratory practice, the use of the method defined MDL and Practical Quantitation Limits (PQL) should be instituted.

SECTION 2

This section consisted of the control charts for Surrogates and Spike Compounds for the methods described. The data was generated from Laboratory Control Samples and Matrix Spike Samples. Both warning and control limits are displayed on the graph. The data appears to be in order.

SECTION 3

The Instrument Calibration Curves for the Inorganic Methods are the printouts from the indicated instruments computer software which has been developed for this purpose. The data appears to be in order.

SECTION 4

The Performance Evaluation Results for the last three years Performance Tests are listed. The results indicated the Laboratory had passed with 96% correct. The incorrect results are listed in Attachment B.

PART I

ON-SITE EVALUATION REPORT
22-25 March 1994

Principal Evaluators:	**Dr. Garabed H. Kassakhian**	**(909) 381-1674 x221**
	Ms. Stephanie J. Pacheco	**(909) 381-1674 x275**
Tetra Tech Observer:	**Mr. Roderick A. Carr**	**(202) 883-1912**

Orientation Meeting
Analytical Resources Inc.
333 Ninth Avenue North
Seattle, Washington 98109-5187
23 March 1994
3:30 p.m.

Analytical Resources, Inc.

Ms. Michelle Turner
Mr. John Hicks
Ms. M. Suzanne Kitch

Tetra Tech, Inc.

Mr. Roderick Carr (Redmond, Washington)
Ms. Stephanie J. Pacheco (San Bernardino, California)
Dr. Garabed H. Kassakhian (San Bernardino, California)

1. Sample Receiving and Management

Interviewed Analysts: Ms.Terrie Hedger (Supervisor), Mr. Chris Syberg

In general the sample receiving/management process is satisfactory and is documented in a Standard Operating Procedure (SOP).

- Upon receipt, coolers are verified to be clean, and are opened in the fume hood.
- All incoming samples are routinely monitored for radioactivity (if known mixed waste, then the monitoring is done before opening the cooler).
- The temperature of the available temperature blank or the cooler is measured using an NIST traceable mercury thermometer (0°-55°C $\pm$ 0.5°C). The SOP indicates that the acceptance temperature range is 4$\pm$2°C.

<GHK:dmc HAZ\K67-2345, 18 May 1994>

- A follow-up of a real-life anomaly report(action taken by the project manager upon consultation with the Client) and the report itself were not produced, but were mailed in later.

- Within 15 minutes after taking the samples out of the cooler, the sample receiver checks them against the information on the Chain-of-Custody (COC) and for anomalies.

- The pH of non-volatiles samples is checked and adjusted.

- The samples are logged into the Laboratory Information Management System (LIMS) and assigned individual identification numbers (ID). The printed labels indicate the matrix, whether to do MS/MSD, etc. ***The sample labels do not contain the actual storage location in the individual refrigerator.*** In each refrigerator the samples are stored in bins.

- The LIMS is backed up every evening.

- The sample storage refrigerators all have mercury thermometers immersed in glycerin. The temperatures are checked by laboratory's individual employees.

- Suspected highly contaminated samples are flagged with neon-orange stickers ***but are not segregated or stored separately.***

The following deficiencies were noted:

- ***Sample custody/transfer is inadequately documented.***

- ***Labels do not contain the (bin) location in the refrigerator.***

- ***The refrigerators are checked only on work-days. There is no remote alarm system to alert when the electricity has been turned off. Over a long weekend, up to 4 days may go by without anyone being aware of this.***

- ***On the task sheet the expiration of holding times are not clearly spelled out for different tests. Each manager tracks the sample holding times; there are no flags to alert sample tracking.***

2. *Inorganic Analyses*

2.1 Inorganic Sample Extraction Laboratory

Interviewed Analyst: Mr. J. Nelson

2.1.1. Standard Comparability and Storage

- The working standard was traceable to the logbook. The standard bottle label carried the expiration date, but not the logbook
- The neat standard had a valid expiration date on the label and was traceable to the neat standard login book.
- All standards observed were traceable to an NIST source.
- Second source standard was from the same vendor as the primary source (Inorganic Ventures). ARI also uses another second source standard (SPEX) to cross-check on a weekly basis.

2.1.2. Calibration and Quantification

- Automatic pipettes (Ranin) used for spiking are checked on a quarterly basis. Reagents are dispensed in graduated cylinders.
- Top loading scales used to weigh out dry reagents are calibrated on a daily basis. The calibration log book was reviewed.
- The refrigerator used to store soil samples is not monitored on Saturday or Sunday. Currently, the refrigerator is monitored every working day and the criteria for acceptance is $4° \pm 2°C$.

2.1.3. Standard Operating Procedures

- ARI has a very nice Standard Operating Procedure on how to calibrate pipettes. Pipettes are recalibrated on a monthly basis.

The following deficiencies were noted:

- ***No Standard Operating Procedure for how spikes will be performed or amounts to be added to what specific sample. All that exists is a loose leaf notebook paper with some notes and a strong reliance on that the label on the working spike solution bottle is correct.***
- ***Standard Operating Procedure for inorganic sample preparation was present but not finalized nor reviewed by Quality Assurance.***

2.2. Inductively Coupled Argon Plasma, Atomic Absorption Spectroscopy.

Interviewed Analysts: Ms. Christine Gebel (ICP) and Ms. Alice Abolins (AA-Se and As) plus Mr. Jim Fick (Supervisor).

2.2.1. Comparability of Data

- The primary and secondary standards used by ARI are from the same vendor (Inorganic Venture) but an additional standard is purchased from a different vendor (SPEX) to cross check the Inorganic Venture standards.

2.2.2. Calibration and Quantification

- Initial Calibration is performed at the correct frequency and concentration. A single calibration point is performed in five groups to prevent spectral interference.
- Calibrations are verified at the appropriate frequency using a second source standard. The SPEX standards to cross check the Inorganic Venture standards are used in the calibration or continuing calibration verifications (CCVs).
- Method specific calibration criteria is used for ICP and AA (Se/As) analytical runs.
- The analysts response to an out-of-control calibrations are consistent with the method requirements. If the acceptance criteria are not met, the single calibration is repeated. If this fails, the analyst performs a new initial calibration.
- Daily calibration curves are evaluated for linearity for both AA and ICP methods. The criteria for acceptance is based on a linear correlation coefficient, or r, of 0.995.

2.2.3. Standard Storage, Comparability and Records

- Working standards used for ICP and AA reviewed in the Inorganic Extraction Laboratory were labeled correctly and could be related to the Working Standards Logbook.
- Working standard bottles were labeled with the expiration date and concentration of the standard.
- No expired inorganic standards were observed.
- The working standard logbook clearly identified the steps used to prepare standard solutions.

The following deficiences were noted:

- ***Instrument calibration records observed indicated that standards observed in sample preparation as traceable were being used but the unique identifier for that standard that would relate it back to the working standard logbook was not present.***

- ***The working standard preparation and neat standard logbook did not have the expiration dates noted, although the neat and working standard bottles had labels with an expiration date clearly identified.***

2.2.4. Quality Control Execution

- ARI does use method blanks, laboratory control samples for ICP and AA runs to determine the accuracy and precision of analytical batches.

- ARI also uses matrix spikes and duplicate samples to monitor the effects of sample matrix on the analysis. ***The supervisor and analysts were made aware of US Air Force Center for Environmental Excellence (AFCEE) requirements for matrix spike/matrix spike duplicates.***

- All instrument detection limit values that exceed the Handbook MQLs have been noted in the Quality Assurance Project Plan.

- All instrument detection limits are updated on an annual basis.

- ARI will rely on SW-846 acceptance criteria for quality control samples to be used interim limits for analytical control until enough USAF environmental samples are analyzed. At that time, the control limits will be updated.

The following deficiency was noted:

- ***ARI has a very confusing definition of reporting limits, practical quantitation limit and method/instrument detection limit. As a result, it was unclear whether they had statistically derived in-house limits for ICP and AA analyses. This must be determined prior to the first environmental sample being sent to them.***

2.2.5. Out-of-Control Events

The following deficiency was noted:

- ***The analysts interviewed were very aware of what constitutes an out-of-control event but it was not clear that the laboratory has clear instructions for how the analysts should initiate a corrective action.***

2.2.6. Standard Operating Procedures

- SOPs were available for all methods but in draft form only.

- The SOPs for AA and ICP analyses did indicate the appropriate corrective action for common out of control situations.

- The SOPs for AA analyses are method specific and appeared to be compliant with method requirements. The SOPs are initially broken out by the specific equipment and then by method.

- The SOPs reviewed identified all relevant quality control acceptance criteria and listed the corrective actions for common out of control events.

- The SOPs reviewed did reflect the actual procedures used by the laboratory but were not cohesive and had not been finalized.

The following deficiency was noted:

- ***The SOPs reviewed did not have direction for spiking procedures. ARI relies on analyst knowledge for how spiking samples should occur at what concentration.***

2.2.7. Analytical Run Logbooks

- Calibration records are not regularly reviewed during the run but the results are reviewed by the section supervisor.

- Each instrument was uniquely identified in the related run log. Each piece of equipment had its own run log.

The following deficiency was noted:

- ***Each instrument run log contained terminated or invalidated runs; although the reasons why the runs were terminated are not clearly identified in the run log. Nor does it discuss how the system was brought back into compliance, when the run termination was the a result of a nonconformance.***

2.2.8. Corrective Action Reports

- The inorganic section routinely completes Corrective Action Reports. At the time of the audit, an ICP run with a failed LCS was reviewed and a Corrective Action Report was generated.

- The Corrective Action Report used by ARI provides a location to document how control was reestablished for the affected parameters.

2.2.9. Maintenance Logs

- All the major instruments associated with the Inorganic Section had a specific maintenance log book. Care must be taken that each log book has the specific identity of the machine noted.

- Entries in the maintenance logs included the date, signature and description of the problem encountered.

The following deficiency was noted:

- ***The maintenance logs do not detail the diagnosis of the problem nor the verification measures used to demonstrate a return to normal operations. The analysts rely on the Corrective Action Log to note corrective action and return to control due to instrumentation.***

2.3. Cold Vapor Atomic Absorption for Mercury

2.3.1. Comparability of Data

- The mercury standard was NIST traceable.

2.3.2. Calibration and Quantification

- The correct five point calibration for CVAA Hg analysis is performed by ARI.

2.3.3. Standard Storage, Comparability and Records

The following deficiency was noted:

- ***The working mercury standards used were expired. Intermediate standards are made on a daily basis in unlabeled volumetric flasks.***

2.3.4. Quality Control Execution

- ARI does use method blanks, laboratory control samples for CVAA Hg analysis to determine the accuracy and precision of analytical batches.

- ARI also uses matrix spikes and duplicate samples to monitor the effects of sample matrix on the analysis. The supervisor and Hg analyst were made aware of AFCEE requirements for matrix spike/matrix spike duplicates.

2.3.5. Out of Control Events

- The analyst was aware of what constituted an out of control event.

2.3.6. Standard Operating Procedures

The following deficiency was noted:

- ***The SOP had not been finalized.***

2.3.7. Analytical Run Logbooks

The following deficiency was noted:

- ***The analytical run log does not include details of the five point calibration curve that is performed on a daily basis. Only review of the raw data demonstrated the presence of five point calibration.***

2.3.8. Corrective Action Reports

- Corrective actions are detailed on Corrective Action Report forms for review by the supervisor.

2.3.9. Maintenance Logs

- Preventative maintenance log was present for Buck Mercury Analyzer detailing minor repairs to machine. Documentation for the return to control of this system was not present.

2.4. Total Organic Carbon, SW 9060 Modified

2.4.1. Comparability of Data

- Did not review whether the standards used were NIST or EPA traceable.

2.4.2. Calibration and Quantification

- Calibration is being performed at the correct frequency and concentrations.

2.4.3. Standard Storage, Comparability and Records

- The stock solution used for soil analysis and the diluted stock solution used for water analysis were all traceable to the working standard log book.

- Standard labels had concentrations and expiration dates noted.

2.4.4. Quality Control Execution

- A method blank, and laboratory control samples are incorporated in the analytical run for Total Organic Carbon determination.

- To monitor the effects of sample matrix on the analysis matrix spikes and matrix spike duplicate samples are used in the Total Organic Carbon analytical run at the proper frequency.

2.4.5. Out-of-Control Events

- Analysts rely on personal knowledge rather than on any written instructions to dictate further action.

2.4.6. Standard Operating Procedures

The following deficiency was noted:

- ***An SOP for Total Organic Carbon was present but not in a final form.***

2.4.7. Analytical Run Logbooks

The following deficiency was noted:

- ***A bound run log is not used for the determination of Total Organic Carbon. Instead, a loose bench sheet is used. The analyst should use a bound log book.***

2.4.8. Corrective Action Reports

- The analysts was aware of what constitutes an out-of-control event and that these events must be detailed on a Corrective Action Report.

2.4.9. Maintenance Logs

- Preventative maintenance documentation is very good. All instrument parameters and settings are present. The analyst has taken it upon herself to detail how the machine was brought back into control after maintenance is performed.

2.5. Fe^{+2}/Fe^{+3}

2.5.1. Calibration and Quantification

- Calibration includes a seven point curve.

2.5.2. Quality Control Execution

- A method blank, and laboratory control samples are incorporated in the analytical run for Ferrous and Ferric Iron determination

- To monitor the effects of sample matrix on the analysis matrix spikes and duplicate samples are used in the Ferrous and Ferric Iron analytical run at the proper frequency.

2.5.3. Standard Operating Procedures

- Acceptance criteria ($r^2=0.99$) for calibration were identified in the SOP.

- The SOP for Ferrous and Ferric Iron determination was in a finalized form.

3. Organic Analyses

3.1. Organic Extractions

Interviewed Analyst: Tarry Hawk-Thomas (Supervisor)

- The SOP is in revision, expected completion date is April 1994.
- Spike witnesses have been operative since August 1993; no double or triple spiking has been observed since.
- The priorities are set up by the Supervisor who also tracks the holding times.
- The GPC SOP is currently being revised. The EPA CLP Statement of Work (SOW) is the basis of the work.

The following deficiencies were noted:

- ***The current(old) SOP does not contain the surrogate and spiking techniques, instructions for taking samples out of and returning them to the walk-in refrigerator.***
- ***No expiration dates are posted on the spikes or surrogates.*** **It is assumed that they expire one year from the preparation date.**
- Separate syringes are used for spiking and surrogate delivery. ***They are not labelled as such, nor are the identical boxes into which they are stored/returned.***
- **The GPC is located in the same laboratory as the organic extractions operation, with no fume hood, or ventilation/exhaust system of its own. Although ARI seems not to have experienced methylene chloride contamination (usually in the range of less than 2 parts per billion)** ***the GPC must be removed from the organic extraction room. It requires a separate, dedicated hood and ventilation. It must have a separate room with negative pressure (air flow into the room) and an exhaust to the outside.***

3.2. Balances

- No inadequacies noted, except for the absence of corrective action documentation for out-of-control events.

3.3. Gas Chromatography (Methods SW 8020 and SW8015/Gasoline)

Interviewed Analysts: Mark Raffier, Peter Kepler (Supervisor)

3.3.1 Calibration and Quantitation

- Method-specified calibration criteria are used for each method.

- The methods have not been out of control for over a year.
- The daily calibration curves are evaluated for linearity following EPA Methods.
- The working standards, which are prepared daily at 25 ug/L, were labeled with the correct concentrations and agree with the information in the standards logbook.
- Expired standards are neither used nor revalidated.

The following deficiencies were noted:

- **For SW 8020 benzene, toluene, ethylbenzene, and xylenes (BTEX) the initial calibrations performed at the method-specified number of concentration levels are a *confusing hybrid of the old(5, 25, 50, 100, 125) and draft(1, 10,25, 50, 100) SOPs.***
- **For SW8015 Gasoline the calibrations are verified at the appropriate frequencies using second source standards from an independent supplier, i.e. Accustandard and Macroscientific. *No Accustandard certificates were available at the time of the audit. SW8020 uses a non-traceable Accustandard standard without a 2nd source standard for confirmation.***
- ***The 8015 gasoline and 8020 standards do not carry expiration dates or concentrations.***
- ***Inadequate sample control once the sample is extracted and put in the refrigerator. No one signs out the samples from the refrigerator, and the only way of tracking who worked with the sample is from the working log books.***
- ***The SW8020 Practical Quantitation Limits (PQLs) for soil are higher than the SW8260 limits, i.e. the Reporting Detection Limits (RDLs) excel the Installation Restoration Program (IRP) Handbook Maximum Quantitation Limits (MQLs). According to ARI this is caused by conducting methanol extraction rather than a direct sparge as required by SW846.***

  It is the recommendation of these auditors that ARI's Method SW8020 not be used for the Kotzebue LRRS project.

3.3.2. Quality Control Execution

- The laboratory uses method blanks, laboratory control samples (LCSs) to determine the accuracy and precision of the analytical batches at the rate of one per batch or for every 20 samples.
- The matrix spikes and the LCSs contain all the target analytes.
- Samples with outlying surrogate recoveries are reanalyzed.
- The Method Detection Limits (MDLs) are updated annually.

- The experimentally determined quantitation limits are reported in the data packages.

- Quality Control (QC) acceptance limits are available for method SW8020.

The following deficiencies were noted:

- ***Control limits for 8015 gasoline were not available at the time of the audit.***

3.3.3. Out-of-Control Events

- The analyst initiates corrective action by informing the supervisor and after its completion by recording the corrective action in the run log book.

The following deficiencies were noted:

- ***Return to control after routine or non-routine maintenance is not documented.***

3.3.4 Standard Operating Procedure

The following deficiencies were noted:

- ***The laboratory is using outdated SOPs which contain crossed out sections, with no authorized change date or initials of the ARI staff member making or authorizing these changes. These SOPs do not discuss appropriate corrective action for common out-of-control situations.***

- ***The surrogate acceptance limits are NOT included in the old nor in the draft SOPs.***

3.3.5. Quality Assurance

The following deficiencies were noted:

- ***The Quality Assurance Officer does not conduct audits of the organic Gas Chromatography (GC) section. An audit report should include the average workload of the GC section, the number of analytical violations and a summary of corrective action requests issued.***

3.4 Gas Chromatography (Methods SW8081/Organochlorine Pesticides and Polychlorinated Biphenyls and SW8015 Modified (LUFT)/Diesel)

Intserviewed Analyst: Mr. Mark Wolfe

3.4.1 Calibration and Quantification

- Initial calibrations are performed at the method-specified number of concentrations.

- Daily calibration curves are evaluated for linearity for EPA Method 8081 and 8015 Modified, Diesel

- GC calibration records provide evidence of the proper frequency of calibration, the use of traceable standard, calibration checks, and appropriate response to out of control calibrations.

The following deficilencies were noted:

- ***Calibrations are not verified at the appropriate frequencies using second source standards. The standards are verified at the time they are made rather than during the analytical run. The second source material is from the same vendor as the primary source.***

- ***Method specific criteria are not being used for EPA Method 8081. ARI uses modifications to the calibration requirements that have been approved by the State of Washington. Currently, the analyst quantitates against the continuing calibration point rather than the initial calibration curve.***

- ***GC calibration records are not being reviewed by either the supervisor of the section nor by Quality Assurance.***

3.4.2 Standard Storage, Comparability and Records

- Working standards are labeled with the concentration but it is unknown whether this information is related to the working standards log book.

- Standard labels have expiration dates for the standard.

- Expired standards are not revalidated by ARI.

- The neat standard log book detailed all the steps used to prepare the working standards.

The following deficiencies were noted:

- ***Current standards are stored in the same location as expired standards. A recommendation was made at the time of the audit that expired standards be placed in a separate location.***

- Purchased standard solutions are uniquely identified in the preparation logbook ***but expiration dates of standards are not located in the logbook; only on the label of the standard.***

- ***Working standards located in Refrigerator #17 were inconsistently labeled with respect to the preparation log book.***

3.4.3 Quality Control Execution

- ARI does use method blanks, laboratory control samples for EPA Method 8081 and 8015 Modified runs to determine the accuracy and precision of analytical batches.
- ARI also uses matrix spikes and matrix spike duplicate samples to monitor the effects of sample matrix on the analysis.
- All instrument detection limit values that exceed the Handbook MQLs have been noted in the draft Quality Assurance Project Plan.
- All instrument detection limits are updated on an annual basis.
- ARI will rely on SW-846 acceptance criteria for quality control samples to be used interim limits for analytical control until enough USAF environmental samples are analyzed. At that time, the control limits will be updated.
- No control charts were reviewed for EPA Method 8081 or 8015 Modified analytes.
- The laboratory will use method specific default limits until enough data is generated to provide in-house limits.

The following deficiencies were noted:

- ***ARI has a very confusing definition of reporting limits, practical quantitation limit and method/instrument detection limit. This discrepancy must be alleviated prior to the first environmental sample being sent to them.***
- ***Currently, for EPA Method 8081, the analyst quantitates any positive value against the continuing calibration point rather than the initial calibration curve. We would like to insist that all samples sent to ARI for analysis collected during the RI/FS work effort at Kotzebue LRRS be quantitated against the initial calibration as per SW-846.***
- ***At the time of our audit, ARI did not have an MDL study for soil and water for EPA Method 8081. This information must be acquired by the laboratory for all associated pesticides, all PCB isomers and Toxaphene prior to receipt of any US Air Force samples requesting this analysis.***
- ***Samples with outlying surrogates are not being reanalyzed. At the time of the audit, we requested that the samples with failed surrogate recovery be reanalyzed to confirm matrix interference.***

3.4.4 Out-of-Control Events

- The analysts interviewed were very aware of what constitutes an out-of-control event.
- To initiate a corrective action, the GC analyst will 1) discuss with the ARI project manager, and, 2) Fill out a Corrective Action Report as necessary.

3.4.5 Standard Operating Procedures

- The Standard Operating Procedure for EPA Method 8081 does provide necessary information about second column confirmations.

The following deficiencies were noted:

- ***Standard Operating Procedures were method-specific and were available at the bench for EPA Method 8081 and 8015 Modified but were not in a final form.***

- ***Standard Operating Procedure indicate in some locations the appropriate corrective action for out-of-control situations. This was not consistently present throughout the Standard Operating Procedure.***

- ***The Standard Operating Procedures do not provide sufficient guidance for corrective action for outlying surrogate recoveries. The analyst relies on the direction provided by the ARI Project Manager.***

- ***The Standard Operating Procedure do not identify the concentrations of the calibration verification standards. ARI relies on SW-846 Method 8000 for direction.***

- ***The Standard Operating Procedure does not provide instructions for how to spike samples with appropriate analytes and surrogates. ARI relies on SW-846 Method 8000 for direction.***

- ***The Standard Operating Procedures do list acceptance criteria but not corrective actions for common out-of-control events.***

- ***The Standard Operating Procedures do not reflect that the laboratory is currently analyzing EPA Method 8081 by the Contract Laboratory Program Statement of Work. No samples are being analyzed for EPA Method 8081 analytes by SW-846 protocol. This transition from CLP to SW-846 may be difficult for ARI to accomplish.***

3.4.6 Corrective Action Reports

- The inorganic section routinely completes Corrective Action Report.

- The Corrective Action Report used by ARI provides a location to document how control was reestablished for the impacted parameters.

3.4.7 Maintenance Logs

- All instruments associated with the GC section have their own maintenance logs but do not contain a maintenance schedule.

- Entries in the maintenance logs included the date, signature and description of the problem encountered.

The following deficiency was noted:

- ***The maintenance logs do not detail the diagnosis of the problem nor the verification measures used to demonstrate a return to normal operations. The analysts rely on the Corrective Action Log to note corrective action and return to control due to instrumentation.***

3.5 Gas Chromatography/Mass Spectroscopy (SW 8260 Volatile Organics)

Interviewed Analysts: Jean Alexander, Loren Cruse, John Anderson, Mark Raffier(trainee), Brian Bebee (Supervisor)

3.5.1 Calibration and Quantitation

- A2LA certified traceable internal standards are used (Ultrascientific).
- All internal standards and surrogates carry expiration dates.
- The laboratory control sample (LCS) uses a non-traceable EM Science source.
- The Ultra-Science calibration compounds are non-traceable. The expiration dates are on the vials, not the certificates.
- The daily calibration standard contain all the SW8260 analytes and naphthalene.

The following deficiencies were noted:

- ***All standards and check compounds must be traceable.***
- ***The response factor for method calibration compounds(SPCC/CCV) must be 20% as in SW846, not 25% as in CLP.***

3.5.2 Calibration and Standards Records

- The SW8260 GC/MS calibration records provide evidence of the proper frequency of calibration, the use of traceable standards, calibration checks and appropriate response to out-of-control calibrations.
- The calibration records are regularly reviewed and signed by the section supervisor.
- The calibration standards that are recorded in the logs are uniquely identified, and are traceable to the working standards logbook.
- The standard preparation logbook lists the expiration dates for the working and stock standard solutions, and the standards listed within them have been given unique identifiers.

- The preparation logbooks detail the steps used to prepare standard solutions from source materials.

- The bromoform response is good, the associated internal standard is chlorobenzene-d_5.

3.5.3 Out-of-Control Events

The following deficiency was noted:

- ***Return to control is not documented .***

3.5.4 Standard Operating Procedure

- The SOP describes all the analytical steps completely.

- The new SOP reflect the actual procedures used by the laboratory.

The following deficiencies were noted:

- ***The SOP does not conform to SW846. There are significant modifications that will trigger variance requests.***

- ***The laboratory does not have a mechanism to revise outdated SOPs. It is left to the discretion of the analyst. SOPs should be revised even when one procedural item is changed.***

3.5.5 Quality Control Execution

The following deviations and/or deficiencies were noted:

- ***Surrogates have been moved to different internal standards with no study to back-up claims, whether the changes are scientifically justified, e.g. a new surrogate, 1,2-dichlorobenzene-d4, has been added under 1,4-dichlorobenzene-d_4. 1,2-dichloroethane-d_4 is quantitated under pentafluorobenzene, rather than the 1,4-difluorobenzene specified by the method.***

- ***The initial calibration has a very wide range,i.e. from 1 to 200 parts per billion (ppb), versus the usual 10 to 200 ppb.***

- ***Uses a larger spiking list than required by the method.***

- ***Control limits are not available, and control charting has not been done. The control limits are based on historical data from non-8260 methods.The Kotzebue LRRS Quality Assurance Project Plan matrix spike/matrix spike duplicate (MS/MSD) limits are not valid.***

- ***The response factors must be thoroughly reviewed.***

3.5.6 Quality Assurance

The following deficiencies were noted:

- ***ARI's is not involved in the internal auditing of SW8260 operations.***
- ***Manual integrations are not documented adequately.***

3.6 Gas Chromatography/Mass Spectrometry (SW 8270 - Organic Semi-volatiles)

Interviewed Analysts: Elizabeth(Liz) Anderson (Supervisor); Charles McDonald, Van Spohn, Matthew Bates.

- **The analysts and their supervisor were unaware of the IRP Handbook, the Kotzebue project-specific Quality Assurance Project Plan, and the control limits for Laboratory Control Samples (LCS).**

3.6.1 Calibration and Quantitation

- The calibrations for all instruments are verified at the appropriate frequency with independent standards from a second supplier. Uses A2LA traceable UltraScientific as primary standard, while the 2nd source is a non-traceable Supelco standard.
- Daily calibration curves are evaluated for linearity.
- The working standards are labeled with the correct concentrations and they agree with the information in the standards logbook.
- The current standards are stored separately from the expired standards.
- The expired standards are revalidated periodically.

The following deviations from the method and/or deficiencies were noted:

- ***Initial calibration concentrations are different for different instruments,e.g.***

INCOS:	***5,10,25,50,80 ng/uL***
Finnigan 4500:	***5,10,25,40,60 ng/uL***
CLP requires	***10,25,40,60,80 ng/uL***

- ***CLP specified calibration criteria are used currently.***
- ***The Method Detection Limit (MDL) studies seem to be out of control on the high side.***
- ***The standards do not have expiration dates, only preparation dates.***

- ***Internal standards do not have their concentrations marked on their containers.***

- ***The neat standards, reportedly purchased years ago, do not have expiration dates.***

3.6.2 Quality Control Execution

- To determine the accuracy and precision of analytical batches ARI uses method blanks and LCSs at the frequency of one per extraction batch.

- The effect of sample matrix on the analysis is monitored through the use of matrix spikes and matrix spike duplicates.

- The MS and the LCS contain all the target analytes.

- Samples with outlying surrogates recoveries are reanalyzed, but these instructions were not part of the SOP in use at the time of this audit.

- The MDL studies are updated quarterly for the main analyses.

- Experimentally determined quantitation limits are reported in the data packages only upon the request of the Client.

- Acceptance limits for all QC parameters are available throughout the laboratory and are used to control the analytical batches.

- Every third batch of CLP magnetic tapes is sent to U.S. EPA's Mr. Larry Butler, EMSL, Las Vegas, Nevada.

The following deviations from the method and/or deficiencies were noted:

- ***There was no comparison available to indicate whether the laboratory determined control limits exceeded the method control limits.***

- ***The control limits are CLP method specified, not laboratory generated.***

3.6.3 Out-of-Control Events

- The analysts are aware of control limits. When one of each kind of surrogate fails or any single recovery is less than 10%, then these constitute out-of-control events, which are not discussed in the SOP in use at the time of the audit.

- The corrective action is initiated at the bench, and proceeds all the way to reextraction and reanalysis.

3.6.4 Standard Operating Procedure

- The SOP indicates that when one internal standard is not within limits, the sample must be reanalyzed.

- A "manual integration directive" was written by Liz Anderson, and is currently in draft. It deals with saturation issues, and permitted manual integrations.

The following deviations from the method and/or deficiencies were noted:

- ***The SOP does not correspond to actual practices, and contains handwritten notes all over the page, e.g. sample with outlying surrogate recoveries <u>are</u> reanalyzed.***

- ***The SOP is not clearly written.***

- ***The SOP should address the preparation of the standards, or a separate short SOP commissioned for this purpose.***

3.6.5 Analytical Records

- The instrument run logbooks, containing terminated and invalidated runs, and interrupted sequences do have entries explaining the reasons of such events, and the corrective actions taken.

- Each specific GC/MS instrument is identified in the run logbooks. Each instrument has its individual run logbook.

3.6.6 Quality Control Records

The following deficiencies were noted:

- ***Quality Assurance does not conduct audits of the semi-volatiles GC/MS.***

- ***Mr. Don Patton, Final Data Reviewer (FDR), reviews all manual data integrations. Quality Assurance is not included in this loop.***

3.6.7 Maintenance Logs

The following deficiencies were noted:

- ***Although all major instrument of the GC/MS section have maintenance logs, the pages are not numbered, and the logbooks are not attached to each instrument.***

- ***The maintenance logs do not describe the verification measures to demonstrate a return to normal operation following major service.***

- ***The log entries contain the date and description of the problem, but no signature of the analyst or the operator.***

3.7 Total Petroleum Hydrocarbons EPA Method 418.1

Interviewed Analyst: Mr. Matt Bates

3.7.1 Calibration and Quantification

- Calibration appears to be as specified by the method.

3.7.2 Standard Storage, Comparability and Records

The following deficiencies were noted:

- ***The surrogate used for EPA Method 418.1 did not have an expiration date on it. All standards must have a date of preparation and expiration on the label.***

- ***The standard #S0321945 could not be traced from the run log book to the working standard log book***

- ***There was no way to trace another standard (#254-38) to the working log book as the standard appeared to be mislabeled.***

All standards used in U.S. Air Force samples analyzed by this method must be related to the working standard log book, the neat preparation log book and, finally, the certificate of traceability.

3.7.3. Quality Control Execution

- Control charts for LCS, soil and water, were located near the FTIR instrument and were being actively used.

The following deficiency was noted:

- ***No corrective action was present for the value below the warning level nor for those values indicating a possible trend or bias. Control charts for this method must be reviewed by Quality Assurance for the detection of trends or bias.***

3.7.4 Out-of-Control Events

- The analyst interviewed was aware of what constitutes an out-of-control event and what steps should be taken to correct the problem.

The following deficiency was noted:

- ***Documentation of the out of control event was not clearly elucidated.***

3.7.5 Standard Operating Procedures

The following deficiency was noted:

- ***The Standard Operating Procedure for EPA Method 418.1 could not be located. As a result, no Standard Operating Procedure for this method was reviewed. A standard Operating Procedure for this method must be established by ARI prior to receipt of environmental samples from the RI/FS work effort at Kotzebue LRRS.***

3.7.6 Analytical Run Logbooks

- Run log indicated the proper frequency of quality control samples but the identity of the standard used was not detailed.

3.7.7 Maintenance Logs

The following deficiencies were noted;

- ***The preventative maintenance log book was not located with the FTIR instrument and could not be reviewed. This log book must be either located or a new one established.***

EPA Method 418.1 requires some attention to bring it to the level that other methods reviewed are at. As a result, it is Tetra Tech's opinion that ARI cannot currently analyze U.S. Air Force samples by this method. Tetra Tech recommends that no samples be sent to ARI for analysis by EPA Method 418.1 until the deficiencies identified during this audit have been corrected.

4. Data Packages

- One U.S. Corps of Engineers project package was reviewed, and found to be of acceptable quality.

The following recommendations were made:

- ***PACE type narrative required to cover section D & E of the CLP equivalent list (Table 9-1 of the QAPP.***
- ***The SW8270 surrogates were outside the control limits, but were not flagged in the reviewed U.S. Army Corps of Engineers package.***
- ***All the pages of an SDG should be consecutively numbered. The pages of the reviewed package were not numbered.***

<GHK:dmc HAZ\K67-2345. 18 May 1994>

5. Quality Assurance Project Plan for Kotzebue LRRS

The following recommendations were made:

- ***Use the SW method designations.***
- ***Try to get the preliminary data out.***
- ***Change the Reporting Limit and the Quantitation Limit to conform to the understanding of PQL and MDL.***
- ***Do not use low, high or other CLP terms.***
- ***Be consistent in the use of significant figures.***

6. Analyst Training

- Training files are being kept to document analyst performance on PE samples (as of 2/94).
- Training occurs as on-the-job training. No formal training using PE samples.
- A draft Standard Operating Procedure is in existence for how training occurs. A lead person/trainer instructs new staff members. The trainee would evaluate an LCS/method blank. The results would be filled. The trainee must be rated as "proficient" for 6 months prior to being elevated to trainer level.
- Performance Evaluation samples will be sent to a different analytical group every 6 months.

The following deficiency was noted:

- ***Documentation at this time is incomplete.***

7. Verification of Certification

- State Certification: Washington #C038
  Alaska Acceptance (via facsimile)
  California #1493
- Federal Certifications: Department of the Army, Environmental Hazardous Toxic and Radioactive Waste Division (USACE)

- Performance Evaluation Studies:
  - EPA Water Pollution WP.
  - EPA Water Supply WS.
  - EPA Region 10 TCL and Non-TCL for volatile organics, semivolatile organics, and organopesticides and PCBs.
  - Radiochemistry for DOE/EPA performed on a quarterly basis.
  - APG PE for fuels, gasoline, diesel, BTEX

ATTACHMENT A

DRAFT DRAFT

Detection, Reporting and Quantitation

"Detection" defines whether an analyte is present or absent in a measured sample. "Quantitation" defines whether the determined value for the analyte present is a reliable number. Any value obtained for a sample must be evaluated against established criteria to determine its reliability. To ensure consistency throughout the laboratory, Analytical Resources, Inc. utilizes the following approaches for limit determination and reporting of final results.

DRAFT

Statistical Method Detection Limit

The Statistical Method Detection Limit (MDL) is a statistically derived value indicating the minimum analyte concentration in which there is a 99% confidence that the concentration is greater than zero. Method Detection Limit (MDL) studies are conducted for all parameters using water and sediment matrices. MDL studies are performed in accordance with 40 CFR, Part 136, Appendix B.

MDLs are determined by analyzing seven replicate samples spiked with analytes of interest at levels that are one to five times the estimated detection limit. It is essential that all processing steps for the method are included in the MDL determination. The MDL is calculated as the standard deviation of the replicates multiplied by the Student's t-test value for six (n-1) degrees of freedom.

For methods known to exhibit a greater degree of variability, eight or more replicate samples are processed with t-test multipliers adjusted accordingly.

Reporting Detection Limit

The Reporting Detection Limit (RL) is the lowest value at which qualititative identification of a given analyte is considered by the laboratory to be reliable. The RL is based on the MDL, method efficiency and analyte response. The RL will, at minimum, meet the MDL study result. RLs for analytes or methods known to have a greater degree of variability may exceed the statistical MDL.

DRAFT

Quantitation Limit

The Quantitation Limit (QL) is the level at which an analyte can be reliably quantified as well as detected. The QL defines the lower limit of the useful range of measurements. The QL is determined to be at least 3 times the statistical MDL (10X SD of MDL replicates) , depending upon the analyte and method. The QL will meet or exceed the RL. For analytes considered to be reliably quantifiable at the reporting level, RL and QL values will be the same.

Reporting Procedures

Analytes which may be identifiable at levels below the RL are considered to be unreliable and are not reported. Analytes present at levels above the RL but below the QL are reported and qualified as "estimated" due to the unreliability of quantitation at this level. Analytes present at levels above the QL are considered to be reliable values; these values are reported without qualification.

DRAFT DRAFT DRAFT

ATTACHMENT B

The results for WS032, WS031, WP030 and WP029 which were outside acceptance limits, are listed below. Limits in parentheses.

- WS032: Copper at 82.4 ug/L (738-902 ug/L)
- WS031: Boron at 823 ug/L (652-814 ug/L)
  Calcium at 254 ug/L (214-244 ug/L)
  Zinc at 197 ug/L (161-190 ug/L)
  Cyanide at 0.177 ug/L (0.202-0.337 ug/L)
  Vinyl Cl at 17.7 ug/L (7.14-16.7 ug/L)
  Anthracene at 0.043 ug/L (DL-DL)
- WP030 All within limits
- WP029 Calcium and Potassium failed high by 5%
  Both levels

Re: On-Site Laboratory Evaluation Report - 19 May 1994

Dear Mr. Carr:

The On-Site Laboratory Evaluation Report detailing findings noted during the 22-25 March 1994 audit has been reviewed. The following details the actions taken by ARI to address the deficiencies noted in the report. All Standard Operating Procedures (SOPs) referenced in Volume II of the Kotzebue LRRS QAPP were submitted to AFCEE. Per Michael F. McGhee's letter of 10 May 1994, all SOPs were accepted by the Air Force.

1. Sample Receiving and Management

a. Sample custody/transfer is now documented through the use of custody transfer logbooks. Each sample transfer activity has been addressed. Logbook examples are provided.

b. Sample labels do not contain the storage bin location as this information is not known at the time of sample log-in. The storage bin used is dependent upon space availability at the time samples are placed in storage. The log-in staff do, however, indicate the storage bin location on the Inside Walk-In Log. This alerts the analysts and technicians to the sample locations within the refrigerator.

c. Main sample storage coolers are linked to the building security/alarm system. Should there be a malfunction, an alarm signal would be received by the security company. A key staff member would then be notified by the security company of the situation; corrective action would be taken at that time.

d. Currently, holding times are monitored very efficiently by log-in staff , analytical/prep. section supervisors and analysts. Upon sample receipt, chain of custody forms are reviewed by log-in staff. Samples with short holding times would be immediately brought to the attention of the section supervisor or pertinent analyst. Samples with longer holding times are processed normally. Each day, section supervisors and analysts review sample holding times. Sample processing is scheduled to ensure holding times are met.

2. Inorganic Analyses

2.1 Inorganic Sample Extraction Laboratory

a. The Standard Operating Procedure for sample spiking was completed. A copy of the completed SOP was forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

b. Standard Operating Procedures for inorganic sample preparation have been completed. Copies were forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

2.2 Inductively Coupled Argon Plasma, Atomic Absorption Spectroscopy

a. The standard number assigned during working standard preparation will be noted in the instrument calibration record to ensure unique identification of the standard.

b. Expiration dates have been added to the standard preparation logbook. Logbook examples are enclosed.

2.2.4 Quality Control Execution

a. Statistically derived MDLs and PQLs are being used for this project. Copies of MDL/PQL values for project parameters were previously provided to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

2.2.5 Out of Control Events

a. Instructions for initiating corrective action are detailed in the instrument operation SOPs.

2.2.6 Standard Operating Procedures

a. The Standard Operating Procedure for sample spiking was completed. A copy of the completed SOP was forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

2.2.7 Analytical Run Logbooks

a. Reasons for run termination will be noted on the run log. Actions taken will be noted on the run log. Major maintenance will be documented in the maintenance log. The analytical run verifying return to compliance (standard, blank, etc.) will be noted as such.

(206) 621-6490
(206) 621-7523 (FAX)

2.2.9 Maintenance Logs

a. Maintenance performed and the reason for the maintenance will be documented in the maintenance logs. Verification that control was regained will be noted in the run log (see 2.2.7.a). It is laboratory procedure to also address non-conformances on Corrective Action logs. These logs remain with the sample data and inform the data reviewers and project managers of problems encountered during the analytical run.

2.3 Cold Vapor Atomic Absorption for Mercury

2.3.3 Standard Storage, Comparability and Records

a. Working and intermediate standards are always made daily, just prior to beginning the analytical run. Volumetric flasks used for standard preparation are now labeled.

2.3.6 Standard Operating Procedures

a. The SOP for mercury analysis is complete. A copy of the completed SOP was forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

2.3.7 Analytical Run Logbooks

a. The mercury run log has been revised to include details of the calibration curve. An example is enclosed.

2.4 Total Organic Carbon, SW 9060 Modified

2.4.6 Standard Operating Procedures

a. The SOP for total organic carbon analysis is complete. A copy of the completed SOP was forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

2.4.7 Analytical Run Logbooks

a. A bound logbook for Total Organic Carbon analysis is now in use.

3. Organic Analyses

3.1 Organic Extractions

a. Spiking techniques are addressed in the latest version of the extraction SOPs (in final review). Sample removal and return to storage are detailed in the Internal Chain of Custody SOP.

(206) 621-7523 (FAX)

b. Expiration dates are now written on spikes or surrogates.

c. Syringes and storage boxes are now labeled as to their use.

d. A separate ventilation system for the GPC is on order. Details of this ventilation system were provided to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

3.3 Gas Chromatography (Methods SW 8020 and SW 8015/Gasoline)

a. SW 8020 will not be used for this project. Issues pertaining to SW 8020 are not addressed.

b. Certificates for Accustandard and Macroscientific gasoline standards are enclosed. Per the manufacturers, these certificates provide the maximum level of traceability for gasoline standards.

c. Sample control is maintained through the use of custody tracking logbooks. Instructions for custody maintenance are addressed in the Internal Chain of Custody SOP.

3.3.2 Quality Control Execution

a. Control limits for gasoline are available to the analyst. Limits were generated from Washington TPH-Gasoline method, which, according to the GC Supervisor, are applicable. Gasoline control limits are attached.

3.3.3 Out of Control Events

a. Return to control will be documented. The analytical run verifying return to compliance (standard, blank, etc.) will be noted as such.

3.3.4 Standard Operating Procedures

a. SOPs for the GC section have been revised and completed. Corrective action for out-of-control events have been addressed in the SOPs.

b. Surrogate acceptance limits are summarized in a table and available to all analysts. In the next SOP revisions, the table of acceptance limits will be included in each SOP as an appendix.

3.3.5 Quality Assurance

a. A Laboratory Auditing SOP which details the areas to be audited by the QA section, has been completed. A copy is enclosed. The QA section, which includes the Final QA Data Reviewers, will perform semiannual audits all laboratory sections for general and technical compliance to established procedures. Audit findings and results will be forwarded to the Lab Manager and Board of Directors. Deficiencies will be addressed as detailed in the Laboratory Auditing SOP.

3.4 Gas Chromatography (Methods SW8081/Organochlorine Pesticides and Polychlorinated Biphenyls and SW8015 Modified (LUFT)/ Diesel)

a. Calibration standards will be analyzed after every 10 samples. Calibration standards will be verified against a second source material from a different source than the primary source. Protocol is the primary standard source; NSI Environmental Solutions is the secondary standard source. Certificates for both sources are enclosed. For this project, second source continuing calibration analysis will be performed.

b. For this project, Method 8081 will be followed as written. Quantitation will be against the initial calibration curve.

c. GC calibration records are reviewed by the Final Data Reviewer, who is part of the QA section, during the data review process. As all laboratory data are reviewed prior to final approval and release, any calibration errors or discrepancies are detected at that time. Any problems or issues noted by the Final Data Reviewer will be discussed with the GC Supervisor.

3.4.2 Standard Storage, Comparability and Records

a. Expired standards will be removed from the current standards refrigerator.

b. Expiration dates of standards are now recorded in the preparation logbook. A logbook example is enclosed.

c. Standards in Refrigerator #17 have been reviewed. It appears that the inconsistent labeling noted during the audit was an isolated incident and does not routinely occur.

3.4.3 Quality Control Execution

a. Statistically derived MDLs and PQLs are being used for this project. Copies of MDL/PQL values for project parameters were previously provided to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

(206) 621-6490
(206) 621-7523 (FAX)

b. For this project, Method 8081 will be followed as written. Quantitation will be against the initial calibration curve.

c. MDL studies for method 8081, including PCBs and Toxaphene, were completed. Copies of the MDL/PQL tables were forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

d. Samples with outlying surrogate recoveries will be reanalyzed to confirm matrix interference.

3.4.5 Standard Operating Procedures

a. Standard Operating Procedures (SOPs) for method 8081 and 8015 modified are completed. Copies were forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

b. Corrective actions are addressed in all SOPs in section 9.0, Corrective Actions. This format is consistent for all SOPs throughout the laboratory. All finalized, approved SOPs will have corrective actions detailed in this section.

c. The analysts are aware of appropriate corrective actions for outlying surrogate recoveries. The ARI Project Manager is often consulted to determine if a reanalysis is needed by the client, especially when insufficient sample volume remains for reextraction or due dates are imminent. The client may be contacted to determine the intended use of the data; the existing data may be usable by the client. If time and sample volume permits, reextractions and reanalyses are routinely performed when surrogate QC criteria are not met.

d. Calibration verification standard concentrations are detailed in the SOPs.

e. Spiking procedures are detailed in the Extractions SOPs (in final review).

f. Corrective actions for out-of-control events are detailed in the SOPs under section 9.0, Corrective Actions.

g. At the present time, ARI is equipped to analyze samples for pesticides by both CLP and method 8081.

3.4.7 Maintenance Logs

a. Maintenance performed and the reason for the maintenance will be documented in the maintenance logs. Verification that control was regained will be noted in the run log. It is laboratory procedure to also address non-conformances on Corrective Action logs. These logs remain with the sample data and inform the data reviewers and project managers of problems encountered during the analytical run.

3.5 Gas Chromatography/Mass Spectroscopy (SW 8260 Volatile Organics)

a. Certified, traceable standards are purchased for SW8260 analysis. It was brought to the analysts' attention that, although a standard mix is labeled "certified", this certification may not apply to all compounds in the mix. We are presently looking into alternate standard sources so that all compounds are traceable.

b. The SW 8260 SOP was developed from method 8260, revision 0. This revision states that, for continuing calibrations, 20% is the warning limit and 25% is the action limit. The analysts try to adhere to the 20% criteria.

3.5.3 Out of Control Events

a. The analytical run verifying return to compliance (standard, blank, etc.) will be noted as such.

3.5.4 Standard Operating Procedures

a. The SW 8260 SOP has been modified to conform as much as possible to SW-846. A copy of the SOP was forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

b. A document control SOP has been developed and details how outdated SOPs and SOP revisions are handled. A copy is enclosed.

3.5.5 Quality Control Execution

a. Additional surrogates have been added to provide more quality control. However, for this project, surrogates will be quantitated as specified in method 8260.

b. The initial calibration does indeed cover a wider range than normally seen. This is to meet the requirement of some clients that the instrument be curved down to the level of quantitation.

ANALYTICAL RESOURCES INCORPORATED

Analytical Chemists & Consultants

Seattle, WA 98109-5187
(206) 621-6490
(206) 621-7523 (FAX)

c. The larger spiking list for 8260 contains all method compounds plus additional compounds. The additional compounds were added in response to the needs of clients other than the Air Force.

d. Sufficient data has been acquired for generation of 8260 control limits. This task will be completed by the QA group by June 15th. A copy of the control limits will be forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

e. Response factors are reviewed by the analyst and Final Data Reviewer. Discrepancies or errors not detected by the analyst are found by the Final Data Reviewer. All data undergo such a review prior to final approval and release.

3.5.6 Quality Assurance

a. A Laboratory Auditing SOP which details the areas to be audited by the QA section, has been completed. A copy is enclosed The QA section, which includes the Final QA Data Reviewers, will perform semiannual audits all laboratory sections for general and technical compliance to established procedures. Audit findings and results will be forwarded to the Lab Manager and Board of Directors. Deficiencies will addressed as detailed in the Laboratory Auditing SOP.

b. Manual integrations are documented on the run log and identified on the quantitation report with a unique notation. The analyst generates ion windows for each manually integrated compound. Manual integrations are then checked by the Final Data Reviewer during the data review and approval process. The Final Data Reviewer also initials the quantitation report to indicate manual integrations have been checked.

3.6 Gas Chromatography/Mass Spectrometry (SW 8270 - Organic Semivolatiles)

3.6.1 Calibration and Quantitation

a. Calibration concentrations for each instrument are dependent upon the instrument's linear range. Therefore, the concentrations may differ between instruments. It is standard policy, however, that if a sample concentration exceeds the instrument calibration range, the sample is reanalyzed at a dilution.

b. A SOP for method 8270 has been finalized and approved. The SOP conforms to method 8270. Copies of the SOP were forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

c. MDL study results are based on actual laboratory data. Additional MDL studies will be performed periodically to develop MDLs which reflect laboratory capability.

(206) 621-7523 (FAX)

d. Analysts have been instructed to indicate extraction dates for standards.

e. Analysts have been instructed to indicate internal standard concentrations on the containers.

f. Neat standards without expiration dates are kept by the section for internal checks. Any standards for which the quality appeared questionable were disposed.

3.6.2 Quality Control Execution

a. When applicable, laboratory control limits will be compared to method control limits. If laboratory control limits are wider than method control limits, the limits will be evaluated frequently to determine if it is possible to achieve those limits specified in the method.

b. Laboratory control limits have been generated for SW 8270, but not finalized. The QA section will finalize these limits by June 15th. A copy of the control limits will be forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

3.6.4 Standard Operating Procedures

a. The SW 8270 SOP has been finalized and approved. A copy of the SOP was forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

b. A SOP for Organic Standards Preparation is in final review. It should be finalized and approved within the next two weeks.

3.6.6 Quality Control Records

a. A Laboratory Auditing SOP which details the areas to be audited by the QA section, has been completed. A laboratory-wide audit will be conducted by the QA section.

b. Donn Patton's role as Final Data Reviewer is a quality assurance function. As the Final Data Reviewers' role is primarily QA, ARI management is considering a minor restructuring that would have all Final Data Reviewers as part of the QA section. Any anomalies or issues noted during data review (which covers all results and laboratory data) would be addressed through the QA manager. To date, this restructuring has not been finalized.

(206) 621-7523 (FAX)

3.6.7 Maintenance Logs

a. Logbooks for each instrument are now in place. Pages in each logbook are consecutively numbered.

b. Major maintenance will be documented in the maintenance log. In the run log, the analytical run verifying return to compliance (standard, blank, etc.) will be noted as such.

c. The analysts have been instructed that all log entries must be signed or initialed. The QA section will confirm this is occurring.

3.7 Total Petroleum Hydrocarbons EPA Method 418.1

3.7.2 Standard Storage, Comparability and Records

a. Analysts have been informed that all standards must be labeled with preparation and expiration dates. As the instrument is shared by two sections, the guidelines for standard labeling/logbook completion were understood by one section, but not the other. Both sections are now aware of standard labeling requirements. The QA section will confirm this is occurring.

b. The standard traceability issue has been reviewed. It appears that the standard number was incorrectly written in the log. As part of routine QA section audits, standard traceability will be checked in all lab sections.

3.7.3 Quality Control Execution

a. The section supervisor has been instructed on how to evaluate control charts for out of control situations. At the time of the audit, control charts were being completed, but not reviewed for trends. A copy of the control chart in use at the time of the audit is enclosed.

3.7.4 Out-of-Control Events

a. A maintenance log is now in use. Out of control situations will be noted on the run logs and the Corrective Action form. Analytical runs that verify control was regained (standards, blanks, etc.) will be noted as such in the run log.

3.7.5 Standard Operating Procedures

a. SOPs for method 418.1 soil and water have been finalized and approved. A copy was forwarded to Tetra Tech, Redmond and Tetra Tech, San Bernardino.

(206) 621-7523 (FAX)

3.7.7 Maintenance Logs

a. A maintenance log is now in place for method 418.1.

The QA section has been working with the section supervisor to ensure that 418.1 analysis is adequately documented and properly performed. Logs and SOPS have been implemented.

4. Data Packages

The Project Manager is aware of the recommendations and will incorporate these recommendations into the project scope.

5. Quality Assurance Project Plan for Kotzebue LRRS

The Project Manager is aware of the recommendations and will incorporate these recommendations into the project scope.

6. Analyst Training

a. Training documentation is not yet complete. Training records are in the laboratories; the Training SOP is being completed. The SOP will be completed within the next 30 days.

I will be sending a follow-up letter to confirm that outstanding items have been completed. If you have any questions or additional information, please feel free to call me at (206) 621-6490.

Sincerely,

Magnetic Tape and 5% Raw Data Audit
of
Analytical Results

The Magnetic Tape and 5% Raw Data Audit of Analytical Resources, Incorporated (ARI), Seattle, Washington was conducted on 27-30 September 1994. At the time of the audit, ARI had already produced a total of 7 sample delivery groups (SDGs) for the Remedial Investigation/Feasibility Study (RI/FS) at Kotzebue Long Range Radar Station (LRRS), Project.

The purpose of this audit was to determine the degree in which the raw data matched the reported results sent to Tetra Tech, Inc. in the SDG H686 (Inorganics and AK 102 Methods only)and the Performance Evaluation (PE) Sample in SDG H753 (All Organic and Inorganic Methods).

This report consists of four parts, as listed below:

1. List of Tetra Tech, Inc. auditors, ARI personnel, and the Orientation Meeting summary.

2. Audit Findings. Section 2.1 contains the Organics and Section 2.2 contains the Inorganics and Diesel Range Hydrocarbons audit findings. Each Section lists the Methods and Samples examined, the criteria for the raw data audit, pertinent equations for calculating audit results, and the audit results.

3. Magnetic Tape Audit Method description (Section 3.0), Results from the Tape Audit for the PE Sample (Section 3.1) and Memorandum of Understanding Documents (Section 3.2).

4. The Debriefing Meeting summary with Findings and Conclusions (Section 4.0), Recommendations (Section 4.1).

1. List of Auditors, ARI Personnel and Summary of the Orientation Meeting (27 September 1994)

Tetra Tech, Inc. Auditors: Ms. Lisa L. Arrasmith
Mr. Michael Wilson

ARI Personnel: Mr. John Hicks, Project Manager
Ms. Michelle Turner, Manager, Quality Assurance
Ms. Suzanne Kitwin, Quality Assurance Coordinator

Orientation Meeting: 10:30 am, Tuesday, 27 September 1994.

Tetra Tech stated that the SDGs H686 and H753 would be the subject of the Raw Data Audit. The Magnetic Tape Audit Would be conducted on the PE sample H753 located in SDG H753. The

primary focus of the tape audit would be Method 8260 due to a missed Carbon Tetrachloride result. The PE Certified Results were made known at this time, as authorized by the project manager Mr. Rod Carr (Tetra Tech, Inc., Redmond, WA). It was also stated that some resolution to the use of ambiguous qualifiers would be needed to prevent possible data quality errors or misunderstandings.

2.0.0 Audit Findings

2.1.0 Organics

2.1.1 Organics Audit Methodology

The following is an outline of the procedure followed to audit the organics raw data. All calculations are based on the values from the computer output of the analytical instrument used to generate the raw data. The original raw data sheets must be used and not photocopies of the raw data.

- The tuning standards for Gas Chromatograph/Mass Spectrometry (GC/MS) Methods are checked for ion intensity criteria as listed in each method.
- The initial and/or continuing calibrations are checked by calculating the Calibration Check Compounds (CCC) and the System Performance Check Compounds (SPCC) for each calibration, and comparing these values to the SDG reported values. They should agree within 1%.
- The Laboratory Control Sample (LCS) recoveries are calculated for 10% of the compounds and then compared to SDG percent recoveries.
- The Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries were calculated by using values from 10% of the spiked compounds. Calculate the % RSD for the same 10% and compare to the SDG data.
- Calculate the surrogate recovery for the blank, LCS, MS/MSD and the sample the MS/MSD was derived from. Ten percent of the environmental samples should also be calculated. Compare with SDG results.
- Visually inspect the chromatograms for the blank, the low level standard, and 10% of all other runs. Look for peaks unlabeled or crossed out, get an explanation for these peaks. Check that the elution order is correct.
- Check that the 12 hour time clock for GC/MS methods was observed for all samples, standards, spikes and blanks.
- When the raw data matches the SDG data there is no discrepancy to be reported, the statement "All values checked were found to correlate" will be used.

2.1.2 Calculation Formulas

- Response Factor = $\frac{\text{(Response of Analyte)(Conc. of Internal Standard)}}{\text{(Response of Internal Standard)(Conc. of Analyte)}}$

- % Difference = $\frac{\text{(Response Factor I - Response Factor from Daily Cal.)(100)}}{\text{Response Factor from Initial Cal.}}$

- % Relative Standard Deviation = $\frac{\text{(Std. Deviation of Response Factors)(100)}}{\text{Mean of Response Factors}}$

- % Recovery = $\frac{\text{(Measured Value for Reference Compound)(100)}}{\text{True Value for Reference Compound}}$

2.1.3 Organics Audit Results

Organochlorine Pesticides and Polychlorinated Biphenyls

Method: SW8081

Analyst Interviewed: Peter Kepler

After reviewing several SDGs, six data quality issues were identified which required resolution. These issues and their explanations were as follows:

- Use of the "Y" qualifier which increased PQLs

  Due to large concentrations of hydrocarbon contamination which eluted across retention time windows for several pesticides, the laboratory compensated for this background interference by increasing the Practical Quantitation Limit (PQL) and flagging the PQL with the "Y" qualifier. However, this practice is difficult to defend analytically since it is subjective in nature, and not addressed by USEPA Method 8081.
  The usual protocol for dealing with contaminated extracts suggests the use of absorptive chromatography to selectively trap the contaminants. However, when contamination levels require several absorptive chromatography runs, the resulting loss of target analytes, as measured by surrogate recovery, usually fail quality control criteria. Qualifying the PQL, may give the appearance that the lab is relinquishing its responsibility to determine low level concentrations of Pesticides and Polychlornated Biphenyl (PCB) analytes. In addition, the Air Force's database format is incompatible with increased PQLs for individual analytes.

After talking to the laboratory, it was agreed that the "Y" qualifier would be replaced with a "Z" qualifier. The "Z" qualifier impacts the result only and does not raise the PQL. In a Memorandum of Understanding (MOU) document which was authorized and signed by Mr. Roderick Carr (Project Manager, Tetra Tech, Inc.), Mr. Michael Wilson (Auditor, Tetra Tech, Inc.), and Mr. John Hicks (Project Manager, Analytical Resources, Inc.), the "Z" qualifier was defined and an agreement was stated. This Memorandum of Understanding is presented in Section 3.2 of this report.

- Use of the "X" qualifier which had two contradicting definitions

In a similar situation as with the "Z" qualifier, the "X" qualifier is used to denote results which, in the opinion of the analyst, are not true hits for target analytes, and are artifacts due to hydrocarbon contamination. However, the "X" qualifier is used when definite peaks in the correct retention time window, on both columns, are observed but peak areas and/or peak shapes between each column are not consistent with standard values. The use of the "X" qualifier seems appropriate in these situations where heavy contamination exists. However, the case narrative gives one definition and the report forms give another definition. The case narrative definition is the correct definition. A Memorandum of Understanding was generated to address this problem, and is presented in Section 3.2 of this report.

- Large variations in analyte concentrations between dilutions

When target analytes are detected at concentrations above the calibration range, a dilution is needed to bring the concentration back into the calibration range. Other target analytes detected which were not overrange are again detected in the dilution analysis, however the concentration calculated from the dilution shows a large increase. This increase is due to quantitation inaccuracy at the bottom of the calibration range. This relatively small quantitation error is then multiplied by the dilution factor which produces the large error reported on the data sheets. However, this issue should not be a problem since those analytes that caused a sample to be run at dilution due to their overrange concentration results, should be the only valid values taken from a diluted run.

- Lack of Gel Permeation Chromatography clean-up for contaminated samples

Gel Permeation Chromatography (GPC) is used to reduce the amount of high molecular weight compounds, such as resins or polymers, that may interfere in an analysis. This type of clean-up is usually associated with soil extracts. The soil samples for this project were contaminated with low molecular weight compounds such that GPC has little effect on reducing interfering contamination. Since several samples were subjected to GPC and showed no effect in reducing contamination, this clean-up method was halted. The normal Florisil clean-up was used on contaminated samples as per the method.

- Apparent blank contamination requiring qualifiers

  On occasion, the blank showed some contaminations which were qualified with the "X" qualifier, which indicates the interferences are not target analytes. The method does not require a flat baseline for the blank, but does require the absence of target analytes. Therefore, the lab is compliant with method blank requirements.

- Surrogate control limits differ between QC and environmental samples

  For this method the surrogate control limits for the blank and laboratory control samples (LCS) are different than the surrogate control limits for the environmental samples. It would normally be expected that the blank and LCS surrogate control limits would show tighter values given the reagent water matrix. However, the opposite is true and the apparent reason being the smaller population of QC data points relative to the much larger population of environmental data points, has an inherently lower confidence level which translates to wider limits.

Conculsions

Concerning the 5% raw data audit of 8081, the raw data matched the reported results for the SDG H753 P.E. sample. No certified analytes were missed, and after inspection of the raw data, all calculations and use of the "X" qualifier were correct and justified.

Volatile Organic Compounds

Method: SW8260

Analyst Interviewd: Jane Alexander

During audit preparation several issues came to light which needed resolution. These issues are as follows:

- Use of the "Y" qualifier which increased PQLs

  Due to large concentrations of hydrocarbon contamination which eluted across retention time windows for several volatile compounds, the laboratory compensated for this background interference by increasing the Practical Quantitation Limit (PQL) and flagging the PQL with the "Y" qualifier. However, this practice is difficult to defend analytically since it is subjective in nature, and not addressed by USEPA Method 8260. The usual protocol for dealing with contaminated samples or extracts suggests the sample should be diluted since no column clean-up is used for this method. Qualifying the PQL, may give the appearance that the lab is relinquishing its responsibility to determine low

level concentrations of volatile analytes. In addition, the Air Force's database format is incompatible with increased PQLs for individual analytes.

After talking to the laboratory, it was agreed that the "Y" qualifier would be replaced with a "Z" qualifier. The "Z" qualifier impacts the result only and does not raise the PQL. In a Memorandum of Understanding document which was authorized and signed by Mr. Roderick Carr (Project Manager, Tetra Tech, Inc.), Mr. Michael Wilson (Auditor, Tetra Tech, Inc.), and Mr. John Hicks (Project Manager, Analytical Resources, Inc.), the "Z" qualifier was defined and an agreement was stated. This Memorandum of Understanding is located in Section 3.2 of this report.

- Use of the "X" qualifier which had two contradicting definitions

  In a similar situation as with the "Z" qualifier, the "X" qualifier is used to denote results which, in the opinion of the analyst, are not true hits for target analytes, and are artifacts due to hydrocarbon contamination. However, the "X" qualifier is used when definite peaks in the correct retention time window, are observed but the mass spectral information are not consistent with standard values. The use of the "X" qualifier seems appropriate in these situations where heavy contamination exists and no tentative identification requirement is in effect. However, the case narrative gives one definition and the report forms give another definition. The case narrative definition is the correct definition. The Memorandum of Understanding addressing this issue is presented in section 3.2 of this report.

- Surrogate control limits differ between QC and environmental samples

  For this method the surrogate control limits for the blank and laboratory control samples (LCS) are different than the surrogate control limits for the environmental samples. It would normally be expected that the blank and LCS surrogate control limits would show tighter values given the reagent water matrix. However, the opposite is true and the apparent reason being the smaller population of QC data points relative to the much larger population of environmental data points, has an inherent lower confidence level which translates to wider limits.

Conclusion

Concerning the 5% raw data audit of 8260, the raw data matched the reported results for the SDG H753. One certified analytes was missed and during the magnetic tape audit the reason was clearly determined to be analyst oversight. A discussion of this error is contained in the Magnetic Tape Audit Findings section 3.1 of this report.

5% Raw Data Audit
ARI, Seattle, WA
27-30 September 1994

Semi-Volatile Organic Compounds

Method: SW8270

Analyst Interviewed: Liz Anderson

During audit preparation several issues came to light which needed resolution. These issues are as follows:

- Absence of GPC clean-up for highly contaminated samples

  Gel Permeation Chromatography (GPC) is used to reduce the amount of high molecular weight compounds, such as resins or polymers, that may interfere in an analysis. This type of clean-up is usually associated with soil extracts. The soil samples for this project were contaminated with low molecular weight compounds such that GPC has little effect on reducing interfering contamination. Since several samples were subjected to GPC and showed no effect in reducing contamination, this clean-up method was halted. Failing GPC clean-up, contaminated extracts for Method 8270 are usually diluted.

- Use of the "Y" qualifier which increased PQLs

  Due to large concentrations of hydrocarbon contamination which eluted across retention time windows for several volatile compounds, the laboratory compensated for this background interference by increasing the Practical Quantitation Limit (PQL) and flagging the PQL with the "Y" qualifier. However, this practice is difficult to defend analytically since it is subjective in nature, and not addressed by USEPA Method 8270. The usual protocol for dealing with contaminated extracts suggests the sample should be diluted if GPC clean-up is not useful. Qualifying the PQL, may give the appearance that the lab is relinquishing its responsibility to determine low level concentrations of semivolatile analytes. In addition, the clients database format is incompatible with increased PQLs for individual analytes.

  After talking to the laboratory, it was agreed that the "Y" qualifier would be replaced with a "Z" qualifier. The "Z" qualifier impacts the result only and does not raise the PQL. In a Memorandum of Understanding document which was authorized and signed by Mr. Roderick Carr (Project Manager, Tetra Tech, Inc.), Mr. Michael Wilson (Auditor, Tetra Tech, Inc.), and Mr. John Hicks (Project Manager, Analytical Resources, Inc.), the "Z" qualifier was defined and an agreement was stated. This Memorandum of Understanding is presented in Section 3.2 of this report.

- Use of the "X" qualifier which had two contradicting definitions

  In a similar situation as with the "Z" qualifier, the "X" qualifier is used to denote results which, in the opinion of the analyst, are not true hits for target analytes, and are artifacts due to hydrocarbon contamination. However, the "X" qualifier is used when definite peaks in the correct retention time window, are observed but the mass spectral information are not consistent with standard values. The use of the "X" qualifier seems appropriate in these situations where heavy contamination exists and no tentative identification requirement is in effect. However, the case narrative gives one definition and the report forms give another definition. The case narrative definition is the correct definition. This Memorandum of Understanding is located in section 3.2 of this report.

Conclusion

Concerning the 5% raw data audit of 8270, the raw data matched the reported results in SDG H753. No certified analytes were missed.

2.2.0 Inorganics

2.2.1 Inorganics Audit Methodology

The following is an outline of the procedure followed to audit the inorganics raw data. All calculations are based on the values from the computer output of the analytical instrument used to generate the raw data. The original raw data sheets must be used and not photocopies of the raw data.

- Choose a Sample Delivery Group (SDG) to review. If a performance evaluation (PE) sample was submitted to the lab, include its SDG.
- Obtain the raw data for the SDG of interest, including instrument print outs, strip charts and copies of analysts notes.
- Review the SDG's case narrative. Any discrepancies or out of control instrumentation should be verified in the SDG and the raw data.
- Find the USEPA Method SW6010 results in the SDG and the raw data.
- Choose a sample from the SDG to review. Find the corresponding sample results in the raw data package.
- Compare the analytical results and analysis date in the SDG to the results and date from the raw data package.

- For soil samples, confirm calculations accounting for percent solids content. Confirm Matrix Spike percent recoveries and relative percent difference between MS/MSD and duplicate samples.

- Compare and confirm QC results reported in the SDG, the raw data package and the laboratory's QAPP for:

  Initial and Continuing Calibrations Verifications;
  Initial and Continuing Calibration Blanks;
  Matrix Spikes, Matrix Duplicates and/or Matrix Spike Duplicates;
  Method Blanks and Laboratory Control Samples.

- Document any and all discrepancies found. Immediately contact the department manager, section manager or analyst to discuss and resolve any discrepancies found between the SDG, the raw data package and the QAPP. Completely document the resolution and/or explanation of any discrepancies.

- When all discrepancies are resolved (or none are found), repeat the review procedure for other samples and methods in the SDG.

2.2.2 Calculations

Calculations for soil samples were confirmed from the raw data and the preparation log to the results reported in the SDG. The calculation is as follows:

SDG result (mg/Kg) = instrument result (mg/L) * prep. log conversion (L/g) * (1000 g/Kg)

2.2.3 Inorganics Audit Results

Metals

METHOD SW6010 (ICP)

SDGs Reviewed: H686

Samples reviewed: H686L = SS07-SD1-01 (soil)
H686N = SS07-SD3-01 (soil)
H686E = SS07-SW3-01 (total)
H686F = SS07-SW3-01 (dissolved)

All values checked were found to correspond.

Calibration Verifications (ICVs & CCVs) and Calibration Blanks (ICBs & CCBs):

Calibration results are not included in level I data packages, however, the calibrations were in the raw data at the correct frequency. Any out of control calibrations and their associated samples were rerun as noted in the SDG case narratives.

Method Blanks (PBW, PBS): All values checked were found to correspond.

Matrix Spike/Matrix Spike Duplicates/Matrix Duplicates (MS/MSD/MD) :
All values checked were found to correspond.

Laboratory Control Sample (LCS): All values checked were found to correspond.

Although all the raw data values checked were found to correspond to the values in the SDG, there were several discrepancies within the SDG and the QAPP.

1. The manganese PQL was reported on page 167 as 0.00 mg/L. The MDL study included in the SDG for ICP metals in water dated 5/94 indicates a manganese PQL of 0.01 mg/L. This discrepancy appears to be a typographical error. Replacement pages from ARI would be sufficient to correct the problem with no impact to data quality.

2. Thirteen dissolved metal PQLs are not consistent with the total metals, the QAPP or MDL study included in the SDG for ICP metals in water dated 5/94. This discrepancy could result in inconsistent "J" flagging of the data in Tetra Tech's Level I review. ARI should review their data packages and submit replacement pages for all of the affected data.

METHOD SW7000s

SDGs Reviewed: H686

Samples reviewed: H686L = SS07-SD1-01 (soil)
H686N = SS07-SD3-01 (soil)
H686E = SS07-SW3-01 (total)
H686F = SS07-SW3-01 (dissolved)

All values checked were found to correspond.

Calibration Verifications (ICVs & CCVs) and Calibration Blanks (ICBs & CCBs):

Calibration results are not included in level I data packages, however, the calibrations were in the raw

data at the correct frequency. Any out of control calibrations and their associated samples were rerun as noted in the SDG case narratives.

Method Blanks (PBW, PBS): All values checked were found to correspond.

Matrix Spike/Matrix Spike Duplicates/Matrix Duplicates (MS/MSD/MD) : All values checked were found to correspond.

Laboratory Control Sample (LCS): All values checked were found to correspond.

Although all the raw data values checked were found to correspond to the values in the SDG, there were discrepancies within the SDG and the QAPP. The lead PQL in the SDG is 0.006 mg/L, however, the lead PQL in the QAPP and the MDL study included in the SDG is 0.004 mg/L. This discrepancy could result in inconsistent "J" flagging of the data in Tetra Tech's Level I review. ARI should review their data packages and submit replacement pages for all of the affected data.

DIESEL RANGE HYDROCARBONS
METHOD AK 102

SDGs Reviewed: H686

Samples reviewed:	H686E	SS07-SW3-01
	H686D	SS07-SW2-01
	H686C	SS07-SW1-01
	H686J	SS12-SW3-01
	H686H	SS12-SW1-01 (and dilution)
	H686I	SS12-SW2-01 (and dilution)
	H686A	SS12-SW4-01

Calibration Verifications (ICVs & CCVs) and Calibration Blanks (ICBs & CCBs):

Calibration results are not included in Level I data packages, however, the calibrations were in the raw data at the correct frequency. Any out of control calibrations and their associated samples were rerun as noted in the SDG case narratives.

Method Blanks (PBW, PBS): All values checked were found to correspond.

Matrix Spike/Matrix Spike Duplicates/Matrix Duplicates (MS/MSD/MD) : All values checked were found to correspond.

Laboratory Control Sample (LCS): All values checked were found to correspond.

Surrogate Recoveries: The percent recoveries found in the SDG were calculated correctly.

The aqueous surrogate spike concentration in the raw data is 0.045 mg/L, however the spiking concentration listed in the QAPP or the 7 July 1994 SOP is 0.075 mg/L. The analyst indicated that the QAPP and the SOP both need to be revised and that the 0.045 mg/L spiking concentration listed in the raw data is correct.

Although the raw data values checked were found to correspond to the values in the SDG, there were discrepancies within the SDG and the QAPP. The diesel PQL in the SDG was 0.11 mg/L for water and 7.1 mg/Kg for soil, however, the QAPP and the MDL study included in the SDG list a diesel PQL of 0.2 mg/L for water and 3 mg/Kg for soil. This discrepancy could result in inconsistent "J" flagging of the data in Tetra Tech's Level I review. ARI should review their data packages and submit replacement pages for all of the affected data.

3.0 Magnetic Tape Audit Methodology

The mechanism by which magnetic tape and the time continuum auditing is conducted is complex and detailed by virtue of the three dimensional nature of GC/MS data. However, for the purposes of this report, the following description of the Magnetic Tape Audit Methodology indicates the extent of data needed to fully use this QA/QC tool for Performance Evaluation (PE) Sample elucidation.

After reviewing all pertinent SDG data concerning the PE sample, the data files, directory files and data output files names must be determined for the following:

- Initial Calibration with associated BFB Tune;
- Continuing Calibration(s) with associated BFB Tune(s);
- Method Blank(s);
- MS/MSD Samples;
- LCS Sample(s);
- PE Sample and any dilution(s).

For one PE Sample the minimum files needed are twenty-three. After verifying that the correct files were downloaded without corruption, the files are then renamed in order that, during manipulations for audit purposes, no original files are overwritten. Overwritten files may cause re-downloading of the magnetic tape.

At this point the data from the hard copy SDG and the results from the analyst's raw data and the downloaded computer data output files are compared to each other. Any discrepancies are noted. Assuming the Quant ID File has not changed global method parameters significantly, and the distinct and

separate Calibration File Program has likewise not changed, the initial calibration data files are reprocessed and the Calibration File Program then operates on the initial calibration reprocessed data output files. Again, assuming these data output files were correctly integrated by the computer and no significant manual integration was needed, the average response factors generated by the Calibration Program are imported into the Quant ID File. For SW-846 Method 8260, these are the response factors for all applicable quantification, however, this is true only if the continuing calibration that is reprocessed, meets CCC and SPCC criteria. If the CCC or SPCC fail criteria, either the Initial Calibration data files or Continuing Calibration data file are wrong, or a computer/operator integration has occurred incorrectly.

If all criteria are correct, then the remaining data files are reprocessed and the resulting data output files are compared to the reported SDG results. These are the critical values that the tape audit verifies. Any discrepancies are noted and are issues that need to be resolved. Experience of the auditor is critical when these issues are being resolved.

3.1 Magnetic Tape Audit of Performance Evaluation Sample H753

A Magnetic Tape Audit for the Performance Evaluation (PE) sample (H753) was conducted on-site for EPA Methods 8260 and 8270. By previous arrangement, it was agreed the audit would be conducted in such a manner as to present minimum adverse impact on the laboratory's day-to-day operations. The Magnetic Tape Audit was initiated by downloading the data from the magnetic tape to the hard drive of the Finnigan Incos 50 MS Data System Computer. The tape audit was focused on EPA Method 8260 results, since an error had been detected only in this method and not in EPA Method 8270 results.

Carbon Tetrachloride (CCL_4) was the analyte missed in the PE sample, H753 for Method 8260. After reloading the tape, a peak with a mass spectra consistent with and at the correct retention time for, CCL_4, was observed. At this time, the peak was manually integrated and gave a value of 17.0 ng/ml, which was exactly the certified value. A diagnostic report was generated for this run when the sample was originally analyzed, and was again generated during this audit. The diagnostic report functions in such a way as to show all ion specific area responses, within the compounds retention time window, other QC parameters not withstanding. From the diagnostic report it was verified that the CCL_4 was indeed there, however, the top of the ion peak was missed, which caused this hit to be rejected. After examining the initial diagnostic report, the same information was observed, and at this point the Analyst admitted this information had been overlooked, and took responsibility for missing this analyte.

MEMORANDUM OF UNDERSTANDING

SUBJECT: "X" qualifier definition for Method 8081.

ISSUE: Two definitions of the "X" qualifier are concurrently in use.

RESOLUTION: The first definition of the "X" qualifier exists in the case narrative. The second definition exists on the Method 8081 Form I reports. The first definition, as specified in the case narrative, is correct.

AGREEMENT: The "X" qualifier definition specified in the case narrative replaces the definition on the Method 8081 Form 1 reports.

ANALYTICAL RESOURCES, INC. Project Manager John Riley

DATE: 9/30/94

MEMORANDUM OF UNDERSTANDING

SUBJECT: The use of the "Y" organic qualifier to acknowledge background interference which results in an increased Practical Quantitation Limit (PQL).

ISSUE: The increased PQLs are incompatable with the Client's database format.

RESOLUTION: Instead of qualifying the PQL value for background interference, the result value will be qualified so that the PQL will not increase. This result value qualifier will be indicated by the letter "Z." The "Z" qualifier is defined as follows:

> This flag denotes that, in the opinion of the analyst, the relevant compound may not be present at or below the indicated concentration due to interfering background contamination that prevents a positive or negative spectral confirmation.

AGREEMENT: For those sample delivery groups (SDG) which contain analytes flagged with the "Y" qualifier, an errata sheet will be provided by ARI. This errata sheet will explain that the "Y" qualifier, with the corresponding raised PQL, has been replaced in the sample results with the "Z" qualifier. The previously raised PQLs will default to the normal PQL level. The errata sheet will be an attachment to the case narrative and will be clearly marked as such.

4.0 Debriefing Meeting

10:30 am, Friday, 30 September 1994

Tetra Tech, Inc. Personnel: Mr. Rodrick Carr, Project Manager (Tetra Tech, Inc. Redmond, Washington)
Ms. Lisa Arrasmith, Associate Scientist, Quality Assurance (Tetra Tech, Inc., San Bernardino Office)
Mr. Michael Wilson, Staff Chemist, Quality Assurance (Tetra Tech, Inc., San Bernardino Office)

ARI Personnel: Mr. John Hicks, Project Manager
Mr. Brian Beebe, Organics Supervisor
Mr. Peter Kepler, GC Supervisor
Ms. Suzanne Kitwin, Quality Assurance Coordinator

Findings:

- **Organic PE Sample-** For the organic section of PE sample H753, the laboratory missed only Carbon Tetrachloride in Method 8260, with the reason being an analyst oversight on the diagnostic report. There was one false positive hit detected which was acetone for Method 8260 at 16 ug/ml. However, our experience with this analyte in PE samples indicates, although claimed not to be a certified analyte, is indeed present in the PE sample as a contaminant.

- **Inorganic PE Sample-** For the inorganic section of PE sample H753, no analytes were missed, although there were three false positive detections. The three false positives were Calcium at 0.06 mg/L, Potassium at 0.7 mg/L, and Sodium at 0.2 mg/L with Calcium and Sodium also detected in the blank. Calcium was detected below the Practical Quantitation Limit (PQL) and Sodium was detected at the PQL. The evidence indicates these are lab contaminants and not from the PE sample. Potassium was detected above the PQL but not in the blank, however Potassium is a ubiquitous compound and with the data available, no determination of the source can be elucidated.

- **Qualifier Agreements-** The qualifiers "Y" and "X" have been addressed and agreements were made to smooth out any data quality misunderstandings that may have developed due to their use.

- **Method 6010 -** All raw data values checked were found to correspond to the values reported in the SDG. However, there were several discrepancies within the SDG and the QAPP. For example, the manganese PQL was reported on page 167 as 0.00 mg/L. The MDL study included in the SDG for ICP metals in water dated 5/94 indicates a manganese PQL of 0.01 mg/L. Thirteen dissolved metal PQLs are not consistent with the total metals, the QAPP or MDL study included in the SDG for ICP metals in water dated 5/94.

- **Method 7000s** - All raw data values checked were found to correspond to the values reported in the SDG. The discrepancies within the SDG and the QAPP are the lead PQL in the SDG is 0.006 mg/L, however, the lead PQL in the QAPP and the MDL study included in the SDG is 0.004 mg/L.

- **Method AK 102 Diesel Range Hydrocarbons** - The aqueous surrogate spike concentration in the raw data is 0.045 mg/L, however the spiking concentration listed in the QAPP or the 7 July 1994 SOP is 0.075 mg/L. The analyst indicated that the QAPP and the SOP both need to be revised and that the 0.045 mg/L spiking concentration listed in the raw data is correct.

Conclusions and Recommendation

- Overall, ARI produces high quality chemical analysis. The data ARI generates are indicative of the high standards of integrity the analysts demonstrated during the audit.

- Although highly contaminated samples were sent for analysis to ARI, the laboratory has consistently given results that show good laboratory practices were being followed.

- When the analysts make procedural changes to maintain the highest level of data integrity, SOPs need to be updated immediately and submitted to Tetra Tech so that the QAPP too can be updated immediately.

- ARI should submit replacement pages for the detection limit discrepancies noted in order to prevent erroneous "J" flagging in the Tetra Tech data review process and eliminate future confusion, while preserving data quality.

Recommendation

- Overall Analytical Resources Inc. has performed within the scope of work prescribed for this work effort. At this time all data quality objectives indicated for the analytical results will be met with ARI's deliverables.

1.1 Soil Sampling Audits

1.1.1 Introduction

Drilling and soil sampling activities were performed to document hydrological conditions and to provide a lithologic log of the underlying stratigraphy. Soil samples were collected at approximately 5-foot intervals from each soil and monitoring well borings All soil samples exhibiting abnormal discoloration, or organic vapor concentrations greater than 10 parts per million (ppm) above background, as determined by the appropriate screening technique, were sent to the analytical laboratory to be analyzed for analytes of interest. In the absence of any indications of contamination, samples collected during drilling activities that were associated with sites with surface contaminants, landfill sites, or locations where contaminants may have migrated to, were selected for analysis.

The establishment of boreholes also allowed the collection of subsurface samples for chemical and physical analysis. Tetra Tech's Quality Assurance (QA)1 provided oversight to drilling activities using various regulatory approved documents as well as its own Standard Operating Procedures (SOP) for Field Operations.

1.1.2 Controlling Documents

The following documents were used to provide criteria to evaluate Tetra Tech's staff members performing drilling and soil sampling activities during the work effort at Kotzebue LRRS:

- **Tetra Tech, Inc.**, "*Quality Assurance Project Plan, Installation Restoration Program (IRP) Remedial Investigation/Feasibility Study, Kotzebue Long Range Radar Station, Alaska*", Prepared for United States Air Force, 611th Air Support Group, 611th Civil Engineer Squadron, Elmendorf AFB, Alaska. Volume I (QAPP & Appendix A), October, 1994 (herein refereed to as *QAPP*).

- **Tetra Tech, Inc.**, "*Field Sampling Plan, Installation Restoration Program (IRP) Remedial Investigation/Feasibility Study, Kotzebue Long Range Radar Station, Alaska*", Prepared for United States Air Force, 611th Air Support Group, 611th Civil Engineer Squadron, Elmendorf AFB, Alaska. October, 1994 (herein refereed to as *FSP*).

- **Tetra Tech, Inc.**, "*Standard Operating Procedure, Trip Blanks*". Effective Date: 15 November 1993;

- **Tetra Tech, Inc.**, "*Standard Operating Procedures for Quality Assurance Field Audits for the Air Force Center for Environmental Excellence Installation Restoration Program, Brooks Air Force Base Projects: QA Record Keeping Audit, QA Environmental Soil Sampling Audit, QA Environmental Water Sampling Audit*". Standard Operating Procedure No. 003, Effective Date: 21 April 1994;

- **Tetra Tech, Inc.**, "*Draft Standard Operating Procedures for Field Operations, Chapter II, Borehole Drilling and Sampling*", August, 1994; and

- **United States Air Force (USAF)**, Installation Restoration Program Division (YAQ),

Human Systems Program Office, Human Systems Division (AFSC), *"Handbook to Support the Installation Restoration Program (IRP) Statement of Work - Volume I - Remedial Investigations/Feasibility Studies (RI/FS),"*, pages 2-1 through 2-32; Updated May 1992 (herein referred to as *IRP Handbook*).

1.1.3 Field Activity Reviewed

To acquire environmental soil samples or to install groundwater monitoring wells at Kotzebue LRRS, boreholes were drilled using hollow stem augers. Soil samples were collected using a modified California split-spoon sampler lined with stainless steel sleeves. Sleeves containing sufficient sample were capped with Teflon ™ paper and caps and labeled with the appropriate information to indicate to the laboratory the required analysis. Soil from remaining sleeves were used for headspace analysis for the presence of volatile organic analytes of interest. Soil samples collected from below the water table (where applicable) were retained for the analysis of physical properties for well design and potential use in fate and transport modeling. Decontamination procedures were reviewed by Tetra Tech's QA to ensure compliance with the above approved guidance documents. Tetra Tech's QA used a checklist entitled "*Environmental Soil Sampling Systems Audit Checklist*" (Appendix A).

1.1.4 Summary of Soil Sampling Audits

1.1.4.1

Type:	Soil Shelby Tubes Sampling Audit
Date:	5 July, 1994
Location:	Site 2212, Spills 2 and 3, Kotzebue LRRS, Alaska
Company Audited:	Tetra Tech, Inc.
Field Auditor:	Mr. A. Saxton
Performance:	*All work was performed according to Tetra Tech's Standard Operating Procedures for Field Work and conformed to the Field Sampling Plan; except for deficiencies as noted below:*
Deficiencies Reported:	No deficiencies reported.
Corrective Action:	Not required.

1.1.4.2

Type:	Soil Sampling (Split-spoon) Audit
Date:	12 July, 1994
Location:	Site 2212, Spills 2 and 3, Kotzebue Long Range Radar Station (LRRS), Alaska
Company Audited:	Tetra Tech, Inc.
Field Auditor:	Mr. A. Saxton
Performance:	*All work was performed according to Tetra Tech's Standard Operating Procedures for Field Work and conformed to the Field Sampling Plan; except for*

deficiencies as noted below:

Deficiencies Reported: No deficiencies reported.

Corrective Action: Not required.

1.2 Surface Soil Sampling Audit

1.2.1 Introduction

Surface soil and sediment samples were collected by driving a core sampler lined with stainless steel or brass sleeves to about 6 inches below the surface or as necessary for sufficient sample volume. The hand auger was used to establish a hole at a specified depth of up to 5 feet below the surface at which the soil samples were obtained using the driven core sampler. In the absence of any indications of contamination, surface samples collected during drilling activities that were associated with sites with surface contaminants, landfill sites, or locations where contaminants may have migrated to, were selected for analysis.

1.2.2 Controlling Documents

The following documents were used to provide criteria to evaluate Tetra Tech staff members performing surface soil sampling activities during the work effort at Kotzebue LRRS:

- *IRP Handbook*, pages 2-1 through 2-32;
- **Tetra Tech, Inc.**, "*QAPP*" and "*FSP*";
- **Tetra Tech, Inc.**, "*Standard Operating Procedure, Trip Blanks*". Effective Date: 15 November 1993;
- **Tetra Tech, Inc.**, "*Standard Operating Procedures for Quality Assurance Field Audits for the Air Force Center for Environmental Excellence Installation Restoration Program, Brooks Air Force Base Projects: QA Record Keeping Audit, QA Environmental Soil Sampling Audit, QA Environmental Water Sampling Audit*". Standard Operating Procedure No. 003, Effective Date: 21 April 1994; and
- **Tetra Tech, Inc.**, "*Draft Standard Operating Procedures for Field Operations, Chapter IX, Surface, Sediment, and Hand Auger Sampling*", August, 1994.

1.2.3 Field Activity Reviewed

Tetra Tech's QA used a checklist entitled "*Environmental Soil Sampling Systems Audit Checklist*" (Appendix A).

Pertinent information associated with these soil samples such as discoloration, and organic vapor

measurements were recorded in the sampler's logbook. Samples selected for chemical and/or physical analysis were collected in a steel or brass sleeve. After sampling, the sleeves were removed from the sampling barrel. Each end of the sleeve was sealed with Teflon ™ lined plastic end caps and the caps secured with tamper proof inert Teflon™ tape. The sleeves were then stored in ice chests with enough Blue Ice™ to ensure that the samples will remain at the prescribed temperature. The required analysis were recorded on the appropriate COC and the samples were transported to the laboratory for analysis.

1.2.4 Summary of Surface Soil Sampling Audits

Type: Hand-Auger Soil Sampling Audit
Date: 5 July, 1994
Location: Site 2212, Spills 2 and 3, Kotzebue LRRS, Alaska
Company Audited: Tetra Tech, Inc.
Field Auditor: Mr. A. Saxton

Performance: *All work was performed according to Tetra Tech's Standard Operating Procedures for Field Work and conformed to the Field Sampling Plan; except for deficiencies as noted below:*

Deficiencies Reported:

- A 1 1/2 oz. glass Volatile Organics (VOA) soil bottle was used instead of a 6-inch brass sleeve. Some disturbance of the sample did occur.

Corrective Action: No corrective action was suggested; the disturbance was unavoidable.

Resolutions: *The EPA Method 8260 soil sample from the hand auger has the possibility of yielding low analytical results due to the limited disturbance of the samples. The Project and Operations Managers were informed of the audit results.*

1.3 Groundwater Well Installation/Development Audits

1.3.1 Introduction

Groundwater samples were obtained from wells that were installed as part of the Kotzebue LRRS work effort. Initial groundwater sampling followed a series of procedures for proper well preparation and sample collection that included well development, well purging and sampling. The well development preceded well purging and sampling by a minimum of 5 days to allow the well to stabilize. During any field day, groundwater samples were collected in order from the least likely to the most likely contaminated wells to minimize the possibility of cross-contamination by sampling activities.

1.3.2 Controlling Documents

The following documents were used to provide criteria to evaluate Tetra Tech staff members performing groundwater well installation/development and sampling activities during the work effort at Kotzebue LRRS:

- *IRP Handbook*, pages 2-1 through 2-32;

- **Tetra Tech, Inc.**, "*QAPP*" and "*FSP*";

- **Tetra Tech, Inc.**, "*Standard Operating Procedure, Trip Blanks*". Effective Date: 15 November 1993;

- **Tetra Tech, Inc.**, "*Standard Operating Procedures for Quality Assurance Field Audits for the Air Force Center for Environmental Excellence Installation Restoration Program, Brooks Air Force Base Projects: QA Record Keeping Audit, QA Environmental Soil Sampling Audit, QA Environmental Water Sampling Audit*". Standard Operating Procedure No. 003, Effective Date: 21 April 1994; and

- **Tetra Tech, Inc.**, "*Draft Standard Operating Procedures for Field Operations, Chapter III, Well Installation, Chapter IV, Well Development, Chapter V, Groundwater Sampling, Chapter VI, Static Water Level Measurements, Chapter VII, Aquifer Testing*", August, 1994.

1.3.3 Field Activity Reviewed

Tetra Tech QA Field Auditor used the "*Environmental Water Sampling Systems Audit Checklist*".

Groundwater samples were collected using Teflon ™ or stainless steel collection vessels such as bailers equipped with bottom-emptying devices. Sample bottles described in the "*Field Sampling Plan*" (herein referred to as *FSP*), appropriate for the required test were used to collect the environmental sample. After filling to the top but not allowing overflow, the containers were tightly capped with the provided lids and secured with tamper proof, inert (e.g., Teflon™) tape. Zero headspace was required for all water samples for volatile analysis. Samples taken for dissolved metal analysis were filtered through a 0.45 μm membrane filter within 15 minutes of sampling. The samples were labeled, wrapped in bubble wrap and stored in ice chests containing sufficient Blue Ice™ to ensure that the samples arrived at the laboratory within the temperature criteria.

Where applicable the sample containers were filled in the order of decreasing volatilization as follows:

- Volatile organics;
- Volatile total petroleum hydrocarbons (gasoline);
- Semivolatile organics;
- Semivolatile total petroleum hydrocarbons (diesel and jet fuel); and
- Metals and general anions and cations.

1.3.4 Summary of Groundwater Well Installation/Development Audits

1.3.4.1

Type: Well Installation Activities Audit
Date: 8 July, 1994
Location: Site SSO2 - MW2 Waste Accumulation Area #2/Landfill Area, Kotzebue LRRS, Alaska
Company Audited: Tetra Tech, Inc.

Field Auditor: Mr. A. Saxton

Performance: *All work was performed according to Tetra Tech's Standard Operating Procedures for Field Work and conformed to the Field Sampling Plan; except for deficiencies as noted below:*

Deficiencies Reported: A minimum of 6 inches of filter sand was used above the well casing. Well was surged to settle the sand. Due to the shallow well depth no tremie pipe was used. Sand and bentonite were poured from the top.

Corrective Action: Not required (please see Resolutions below).

Resolutions: *Variances were obtained from the AFCEE to accommodate the above described deficiencies (Letter dated 3 May, 1994, from the AFCEE's PACAF Team Chief Samer N. Karmi to Tetra Tech's Mr. Rick Osgood).*

1.3.4.2

Type: Well Development Activities Audit
Date: 8 July, 1994
Location: Site STO5-MW2, Beach Tank Area, Kotzebue LRRS, Alaska
Company Audited: Tetra Tech, Inc.
Field Auditor: Mr. A. Saxton

Performance: *All work was performed according to Tetra Tech's Standard Operating Procedures for Field Work and conformed to the Field and Sampling Plan; except for deficiencies as noted below:*

Deficiencies Reported: Unable to achieve turbidity of less than 5 NTU.

Corrective Action: Prior to sampling perform adequate purging, wastewater container volume permitting, to achieve an acceptable turbidity readings.

Resolutions: *Logistical problems do not allow unlimited purging to achieve ideal well development readings.*

1.4 Surface Water Sampling Audits

1.4.1 Introduction

Surface water samples were generally taken from the same location as a sediment samples. The locations for collection of surface water samples that were associated with sites with surface contaminants, landfill sites, or locations where contaminants may have migrated into that water body.

1.4.2 Controlling Documents

The following documents were used to provide criteria to evaluate Tetra Tech, Inc. staff members performing surface water sampling activities during the work effort at Kotzebue LRRS:

- *IRP Handbook*, pages 2-1 through 2-32;
- **Tetra Tech, Inc.**, "*QAPP*", and "*FSP*";
- **Tetra Tech, Inc.**, "*Standard Operating Procedure, Trip Blanks*". Effective Date: 15 November 1993;
- **Tetra Tech, Inc.**, "*Standard Operating Procedures for Quality Assurance Field Audits for the Air Force Center for Environmental Excellence Installation Restoration Program, Brooks Air Force Base Projects: QA Record Keeping Audit, QA Environmental Soil Sampling Audit, QA Environmental Water Sampling Audit*". Standard Operating Procedure No. 003, Effective Date: 21 April 1994; and
- **Tetra Tech, Inc.**, "*Draft Standard Operating Procedures for Field Operations, Chapter VIII, Surface Water Sampling*", August, 1994.

1.4.3 Field Activity Reviewed

Tetra Tech's QA Field Auditor used a checklist entitled "*Environmental Water Sampling Systems Audit Checklist*" (Appendix A).

Water samples taken from a surface water source were collected using Teflon™ or stainless steel collection vessels such as bailers equipped with bottom-emptying devices. Sample bottles, described in the "*Field Sampling Plan*", appropriate for the required test were used to collect the environmental sample. After filling to the top but not allowing overflow, the containers were tightly capped with the provided lids and secured with tamper proof, inert (e.g., Teflon™) tape. Zero headspace was required for all water samples for volatile analysis. Samples taken for dissolved metal analysis were filtered through a 0.45 μm membrane filter within 15 minutes of sampling. The samples were labeled, wrapped in bubble wrap and stored in ice chests containing sufficient Blue Ice™ to ensure that the sample arrived at the laboratory within the temperature criteria.

Wherever required, sample containers were filled in the order of decreasing volatilization as follows:

- Volatile organics;
- Volatile total petroleum hydrocarbons (gasoline);
- Semivolatile organics;
- Semivolatile total petroleum hydrocarbons (diesel and jet fuel); and
- Metals and general anions and cations.

1.2.4 Summary of Surface Water Sampling Audits

1.2.4.1

Type: Surface Water Sampling Audit

Date: 10 July, 1994
Location: Kotzebue LRRS, Alaska
Company Audited: Tetra Tech, Inc.
Field Auditor: Mr. A. Saxton

Performance: *All work was performed according to Tetra Tech's Standard Operating Procedures for Field Work and conformed to the Field Sampling Plan; except for deficiencies as noted below:*

Deficiencies Reported: No deficiencies reported.

Corrective Action: Not required.

1.5 Log Book Audit

1.5.1 Introduction

All information pertinent to a field survey and/or sampling effort related to the work effort at Kotzebue LRRS was recorded in a permanently bound field log book. The field log books were waterproof and the pages were consecutively numbered. Entries were made with indelible ink and were detailed at a level so as to enable reconstruction of the events without relying on memory.

1.10.2 Controlling Documents

The following documents were used to provide criteria to evaluate Tetra Tech, Inc. staff log book entries that were connected to the work effort at Kotzebue LRRS:

- *IRP Handbook*, pages 2-1 through 2-32;
- **Tetra Tech, Inc.**, "*QAPP*";
- **Tetra Tech, Inc.**, "*Standard Operating Procedures for Quality Assurance Field Audit for the Air Force Center for Environmental Excellence Installation Restoration Program, Brooks Air Force Base Projects. QA Record Keeping Audits, QA Environmental Soil Sampling Audit, QA Environmental Water Sampling Audit*". Standard Operating Procedure No. 003, Effective Date: 21 April 1994; and
- **Tetra Tech, Inc.**, "*Draft Standard Operating Procedures for Field Operations, Chapter II, Borehole Drilling and Sampling; Chapter IV, Well Development; Chapter V, Groundwater Sampling, Chapter IX, Surface, Sediment, and Hand Auger Sampling; and Chapter XI, Landfill Trenching and Sampling*", August, 1994.

1.5.3 Field Activity Audited

Tetra Tech's QA Field Auditor used a checklist entitled "*Field Activities Record Keeping Audit Checklist*" (Appendix A).

The Tetra Tech, Inc. auditor reviewed logbooks for the following entries:

- Name and address of field contact located on the log book cover;
- The date of the entry;
- Names and affiliations of personnel on the site;
- General description of each day's field activities;
- Documentation of weather conditions during sampling;
- Location of sampling (e.g., borehole number and proximity to nearest cross street or topographic point of reference);
- Data points for field equipment derived during calibration procedures;
- Observations of sample or collection environment;
- Identification of sampling device;
- Any field measurements made, such as ambient air monitoring or headspace analysis of soil;
- Sequence of collection of environmental samples;
- Type of sample matrix (e.g., soil, groundwater, etc.);
- Date and time of environmental sample collection;
- Field sample identification number;
- Sample distribution (e.g., laboratory, courier, etc.);
- Sampler's name;
- Sample type (e.g., composite, normal, duplicate, etc.);
- For groundwater samples, which sample was filtered plus filter screen size and type; and
- Preservative use, if applicable, for the environmental sample.

The bottom of each page in the logbook was signed or initialed by the individual making the entry. If an error was made, corrections were made by simply crossing a line through the error is such a manner that the original entry can still be read, and the correct information was added as the change. All corrections were initialed and dated by the author.

1.5.4 Summary of the Log Book Audit

Type:	Field Activities Record Keeping Audit
Date:	5 July, 1994
Location:	Kotzebue LRRS, Alaska
Company Audited:	Tetra Tech, Inc.
Field Auditor:	Mr. A. Saxton
Performance:	*All work was performed according to Tetra Tech's Standard Operating Procedures for Field Work and conformed to the Field Sampling Plan; except for deficiencies as noted below:*

Deficiencies Reported: No deficiencies reported.

Corrective Action: Not required.

1.6 Standard Operating Procedures

The following Standard Operating Procedures (Appendix A) were used to provide criteria and corrective action guidance for the various field efforts for the Kotzebue LRRS project:

- **Tetra Tech, Inc.**, " *Draft Standard Operating Procedures for Field Operations*", August, 1994.
    - Chapter II, " Borehole Drilling and Sampling";
    - Chapter III, " Well Installation";
    - Chapter IV, " Well Development";
    - Chapter V, " Groundwater Sampling";
    - Chapter VI, " Static Water Level Measurement ;
    - Chapter VII, " Aquifer Testing";
    - Chapter VIII," Surface Water Sampling";
    - Chapter IX, " Surface, Sediment, and Hand Auger Sampling";
    - Chapter XI, " Landfill Trenching and Sampling"; and
    - Chapter XV, " Sample Storage, Packaging and Shipping".
- **Tetra Tech, Inc.**, "*Standard Operating Procedures for Quality Assurance Field Audits for the Air Force Center for Environmental Excellence Installation Restoration Program, Brooks Air Force Base Projects: QA Record Keeping Audit, QA Environmental Soil Sampling Audit, QA Environmental Water Sampling Audit*". Standard Operating Procedure No. 003, Effective Date: 21 April 1994.
- **Tetra Tech, Inc.**, "*Standard Operating Procedure for Packaging and Shipping of Groundwater and Soil Samples*". Effective date: 13 November, 1992; and
- **Tetra Tech, Inc.**, " *Standard Operating Procedure: Trip Blanks*". Effective date: 15 November, 1993.

2.1 Tetra Tech, Inc. Audit of Analytical Resources, Inc.(ARI), Seattle, Washington, 22-25 January, 1994

2.1.1 Introduction

Analytical Technologies, Inc. (ARI), Seattle, Washington (henceforth called ARI), was chosen by Tetra Tech in January 1994 to analyze environmental samples of both soil and water matrices collected at Kotzebue Long Range Radar Station (LRRS), Alaska, for solid waste analytes of interest.

2.1.1.1 Past Audits

Tetra Tech's Dr. Garabed H. Kassakhian, Project QA/QC Manager (San Bernardino, California) and Mr. Roderick Carr, Project Manager (Redmond, Washington) made a preaudit visit to ARI on 11-12 January, 1994 to assess the laboratory's suitability and preparedness for USAF quality work.

On 8 February, 1994, ARI submitted a Preliminary Review Package to the Air Force Center for Environmental Excellence (AFCEE) for their review. On 17-18 March, 1994, this package was also reviewed by Tetra Tech's Auditing Chemist, Mr. Michael Wilson (San Bernardino, California). In a letter, dated 17 June, 1994, the AFCEE's Chief of the Consultant Operations Division, Lt.-Col. Dr. Darrel R. Cornell informed Tetra Tech's Dr. Garabed H. Kassakhian that Tetra Tech could submit U.S. Air Force (USAF) environmental samples to ARI.

2.1.1.2 Project Specific Quality Assurance Project Plan

A draft project specific Quality Assurance Project Plan (QAPP) was written by Tetra Tech, entitled *"Quality Assurance Project Plan, Installation Restoration Program (IRP) Remedial Investigation/Feasibility Study, Kotzebue Long Range Radar Station, Alaska"*; this draft QAPP was submitted to the AFCEE and state and Federal regulators for their review and comments. The QAPP was finalized in October 1994.

2.1.1.3 On-Site Audit of ARI, Seattle, Washington

Based on the AFCEE's recommendation, on 22-25 March, 1994, Tetra Tech conducted an on-site audit of the laboratory to determine whether the laboratory could analyze environmental samples using USAF specifications.

Key ARI and Tetra Tech staff members that participated in the audit were as follows:

Analytical Resources, Inc. (ARI):

Ms. Liz Anderson, Supervisor, Semivolatile GC/MS
Mr. Brian N. Bebee, Supervisor, Volatile Organics GC/MS
Ms. Susan Dunnihoo, Supervisor, Data Management
Mr. Jim Fick, Supervisor, Inorganics Spectroscopy
Ms. Terri Hedger, Supervisor, Sample Receiving and Management
Mr. John Hicks, Project Manager
Mr. Peter Kepler, Supervisor, Volatile Organics by GC
Ms. M. Suzanne Kitch, Quality Assurance Officer
Mr. Jay Kuhn, Section Supervisor
Mr. J. Nelson, Analyst, Inorganic Extraction Laboratory
Ms. Tarry Hawk-Thomas, Supervisor, Organic Extractions
Ms. Michelle Turner, Manager, Quality Assurance

Tetra Tech, Inc. Evaluators:

Dr. Garabed H. Kassakhian, Project QA/QC Manager (San Bernardino, California)
Ms. Stephanie Pacheco, Auditor, Quality Assurance (San Bernardino, California)

Tetra Tech Observer:

Mr. Roderick A. Carr, Project Manager (Redmond, Washington)

On 22 March, 1995 an orientation meeting was held between the Tetra Tech evaluators and ARI's Ms. Michelle Turner, Mr. John Hicks, and Ms. M. Suzanne Kitch.

2.1.2 Evaluated Methods and Processes

The following methods and processes were reviewed during the on-site evaluation/audit of PACE-Minnesota:

- Volatile Organics by EPA Methods 8020, 8240 and 8260.
- Semivolatile Organics by EPA Method 8270;
- Pesticides and PCBs by EPA Method 8080;
- Total Petroleum Hydrocarbons by EPA Method 8015 Modified;
- Toxicity Characteristic Leachate Procedure by EPA Method 1311;
- Cyanide by EPA Method 9010;
- Polycyclic Aromatic Hydrocarbons by EPA Method 8310
- Total Metals by EPA Method 6010;
- Metals and Metalloids by EPA Methods 7000;
- Sample Management;
- Deliverables and Data Packages;
- Performance Evaluation Results; and
- Analyst Training.

2.1.3 Findings, Deficiencies, Discrepancies, Nonconformances

2.1.3.1 Sample Management

The following deficiencies, discrepancies, and/or nonconformances were noted during the audit:

- Sample custody/transfer was inadequately documented.

- Labels did not contain the (bin) location in the refrigerator.

- The refrigerators were checked only on work-days. There was no remote alarm system to alert when the electricity had been turned off. Over a long weekend, up to 4 days may go by without anyone being aware of this.

- On the task sheet the expiration of holding times were not clearly spelled out for different tests. Each manager tracked the sample holding times; there were no flags to alert sample tracking.

2.1.3.2 Inorganic Analyses

The following deficiencies, discrepancies, and/or nonconformances were noted during the audit:

2.1.3.2.1 Inorganic Sample Extraction Laboratory

- There was no SOP or instruction on how to perform spiking, i.e. specific spike amounts to be added to specific samples. All that existed was a loose leaf notebook paper with some notes and a strong reliance on the belief that the label on the working spike solution bottle was correct.

- The SOP for inorganic sample preparation was present but not finalized nor reviewed by ARI's Quality Assurance.

2.1.3.2.2 Inductively Coupled Argon Plasma, Atomic Absorption Spectroscopy.

- Instrument calibration records indicated that traceable standards were being used in sample preparation, but the unique identifier for that standard which should relate it back to the working standards logbook was not present.

- The working standard preparation and neat standard logbook did not note the expiration dates of the standards, although the neat and working standard bottles had labels with the expiration date clearly identified.

- ARI had a very confusing definition of reporting limits, practical quantitation limits (PQL) and method/instrument detection limits. As a result, it was unclear whether they had statistically derived in-house limits for Inductively Coupled Argon Plasma, (ICP) and Atomic Absorption (AA) analyses. Tetra Tech strongly recommended that this be clarified prior to the analysis of the first USAF environmental sample.

- The analysts interviewed were very much aware of what constitutes an out-of-control event, but there were no clear instructions from the laboratory on how and what corrective action the analysts should take.

- The SOPs reviewed did not have instructions for spiking procedures. ARI relied on analyst knowledge for how and at what concentration the samples should be spiked.

- Each instrument run-log contained terminated or invalidated runs; the reasons why the runs were terminated were not clearly identified in the run log. Nor did it discuss how the system was brought back into compliance, when the run termination was a result of a nonconformance.

- The maintenance logs did not detail the diagnosis of the problem nor the verification measures used to demonstrate a return to normal operations. The analysts relied on the Corrective Action Log to record corrective action and return to control.

2.1.3.2.3 Cold Vapor Atomic Absorption for Mercury

- The working mercury standards used were expired. Intermediate standards were prepared on a daily basis in unlabeled volumetric flasks.
- The SOP had not been finalized.
- The analytical run-log did not include details of the five point calibration curve that is performed on a daily basis. Only review of the raw data demonstrated the presence of a five point calibration.

2.1.3.2.4 Total Organic Carbon, EPA Method 9060 Modified

- An SOP for Total Organic Carbon was present but not in final format.
- A bound run-log was not used for the determination of Total Organic Carbon. Instead, a loose bench sheet was used.

2.1.3.3 Organic Analyses

The following deficiencies, discrepancies, and/or nonconformances were noted during the audit:

2.1.3.3.1 Organic Extractions

- The current (old) SOP did not contain the surrogate and spiking techniques, instructions for taking samples out of and returning them to the walk-in refrigerator.
- No expiration dates were posted on the spikes or surrogates. It is assumed that they expire one year from the preparation date.
- Separate syringes are used for spiking and surrogate delivery. They are not labelled as such, nor are the identical boxes into which they are stored/returned.
- The Gel Permeation Cleanup (GPC) was located in the same laboratory as the organic extractions operation, with no fume hood, or ventilation/exhaust system of its own. Although ARI seemed not to have experienced methylene chloride contamination (usually in the range of less than 2 parts per billion) Tetra Tech strongly recommended that the GPC be removed from the organic extraction room. It requires a separate, dedicated hood and ventilation system. It should have a separate room with negative pressure (air flow into the room) and an exhaust to the outside.

2.1.3.3.2 Gas Chromatography (EPA Methods 8020 and SW8015/Gasoline)

- *EPA Method 8020*: the initial benzene, toluene, ethylbenzene and xylenes (BTEX) calibrations performed at the method-specified number of concentration levels were a confusing hybrid of the old (5, 25, 50, 100, 125 μg/L) and draft (1, 10, 25, 50, 100 μg/L) SOPs. A non-traceable Accustandard standard without a 2nd source standard was used for confirmation.

- *EPA Method 8015 Modified Gasoline*: the calibrations were verified at the appropriate frequencies using second source standards from an independent supplier, i.e. Accustandard and Macroscientific. No Accustandard certificates were available at the time of the audit.

- The 8015 Modified Gasoline and 8020 standards did not carry expiration dates or concentrations.

- Inadequate samp.. control once the sample was extracted and put in the refrigerator. No one signed out the samples from the refrigerator, and the only way of tracking who worked with the sample was from the working log books.

- *EPA Method 8020*: Practical Quantitation Limits (PQLs) for soil were higher than the EPA Method 8260 limits, i.e. the Reporting Detection Limits (RDLs) exceed the IRP Handbook's Maximum Quantitation Limits (MQLs). According to ARI this was caused by methanol extraction rather than using a direct sparge as required by SW846.

- Tetra Tech recommended that ARI's EPA Method 8020 not be used for the Kotzebue LRRS project.

- Control limits for 8015 Modified Gasoline were not available at the time of the audit.

- Return to control after routine or non-routine maintenance was not documented.

- The laboratory was using outdated SOPs which contain crossed out sections, with no authorized change date or initials of the ARI staff member making or authorizing these changes. These SOPs did not discuss appropriate corrective action for common out-of-control situations.

- The surrogate acceptance limits were NOT included either in the old, or in the draft SOPs.

- ARI's Quality Assurance did not conduct audits of the organic Gas Chromatography (GC) section. An audit report should include the average workload of the GC section, the number of analytical violations and a summary of corrective action requests issued.

2.1.3.3.3 Gas Chromatography (EPA Methods 8081/Organochlorine Pesticides and Polychlorinated Biphenyls and EPA Method 8015 Modified (LUFT/Diesel))

- Calibrations were not verified at the appropriate frequencies using second source standards. The standards were verified at the time they were made rather than during the analytical run. The second source material was from the same vendor as the primary source.

- Method specific criteria were not being used for EPA Method 8081. ARI used modifications to the calibration requirements that had been approved by the State of Washington. The analyst quantitated against the continuing calibration point rather than the initial calibration curve.

- GC calibration records were not being reviewed by either the supervisor of the section or by ARI's Quality Assurance.

- Current standard were stored in the same location as expired standards. A recommendation was made at the time of the audit that expired standards be placed in a separate location.

- Purchased standard solutions were uniquely identified in the preparation logbook but expiration dates of standards were not located in the logbook; only on the label of the standard.

- Working standards located in Refrigerator #17 were inconsistently labeled with respect to the preparation log book.

- ARI had a very confusing definition of RDL, PQL and method/instrument detection limit. Tetra Tech strongly recommended that this discrepancy be alleviated prior to the first environmental sample being sent to them.

- *EPA Method 8081*: the analyst quantitates any positive value against the continuing calibration point rather than the initial calibration curve. Tetra Tech recommended that all Kotzebue LRRS samples sent to ARI for analysis be quantitated against the initial calibration per SW-846.

- At the time of the audit, ARI did not have an MDL study for soil and water for EPA Method 8081. Tetra Tech impressed on ARI that this information must be acquired by the laboratory for all associated pesticides, all PCB isomers and Toxaphene prior to the receipt of any USAF samples.

- Samples with outlying surrogates were not being reanalyzed. At the time of the audit, Tetra Tech requested that the samples with failed surrogate recovery be reanalyzed to confirm matrix interference.

- SOPs were method-specific and were available at the bench for EPA Method 8081 and 8015 Modified but were not in a final form.

- SOPs indicated in some locations the appropriate corrective action for out-of-control situations. This was not consistently present throughout the SOPs.

- The SOPs did not provide sufficient guidance for corrective action for outlying surrogate recoveries. The analyst relied on the direction provided by the ARI Project Manager.

- The SOPs did not identify the concentrations of the calibration verification standards. ARI relied on SW-846 Method 8000 for direction.

- The SOPs did not provide instructions on how to spike samples with appropriate analytes and surrogates. ARI relied on SW-846 Method 8000 for direction.

- The SOPs did list acceptance criteria but not corrective actions for common out-of-control events.

- The SOPs did not reflect that the laboratory was analyzing EPA Method 8081 by the Contract Laboratory Program Statement of Work. No samples were being analyzed for EPA Method 8081 analytes by SW-846 protocol. This transition from CLP to SW-846 may be difficult for ARI to accomplish.

- The maintenance logs did not detail the diagnosis of the problem nor the verification measures used to demonstrate a return to normal operations. The analysts relied on the Corrective Action Log to note corrective action and return to control.

2.1.3.3.4 Gas Chromatography/Mass Spectroscopy (EPA Method 8260-Volatile Organics)

- All standards and check compounds were not traceable.

- The response factor for method calibration compounds (SPCC/CCV) was not 20% as in Sw846, but 25% as in CLP.

- Return to control was not documented.

- The SOP did not conform to SW846. There were significant modifications that would certainly trigger variance requests.

- The laboratory did not have a mechanism to revise outdated SOPs. It was left to the discretion of the analyst. SOPs should be revised even when one procedural item is changed.

- Surrogates had been moved to different internal standards with no study to back-up claims, whether the changes were scientifically justified, e.g. a new surrogate, 1,2-Dichlorobenzene-d_4, has been added under 1,4-Dichlorobenzene-d_4. 1,2-Dichloroethane-d_4 was quantitated under pentafluorobenzene, rather than the 1,4-Difluorobenzene specified by the method.

- The initial calibration had a very wide range, i.e. from 1 to 200 parts per billion (ppb), versus the usual 10 to 200 ppb.

- Used a larger spiking list than required by the method.

- Control limits were not available, and control charting had not been done. The control limits were based on historical data from non-8260 methods. The Kotzebue LRRS QAPP matrix spike/matrix spike duplicate (MS/MSD) limits are not valid.

- Tetra Tech requested that all the response factors be thoroughly reviewed.

- ARI's QA is not involved in the internal auditing of EPA Method 8260 operations.

- Manual integrations were not documented adequately.

2.1.3.3.5 Gas Chromatography/Mass Spectrometry (SW 8270 - Organic Semi-Volatiles)

- Initial calibration concentrations are different for different instruments, e.g.

INCOS:	5,10,25,50,80 ng/uL
Finnigan 4500:	5,10,25,40,60 ng/uL
CLP requires	*10,25,40,60,80 ng/uL*

- CLP specified calibration criteria were used throughout.
- The MDL studies seemed to be trending out of control on the high side.
- The standards did not have expiration dates, only preparation dates.
- Internal standards did not have their concentrations marked on their containers.
- The neat standards, reportedly purchased years ago, did not have expiration dates.
- There was no comparison available to indicate whether the laboratory determined control limits exceeded the method control limits.
- The control limits were CLP method specified, not laboratory generated.
- The SOP did not correspond to actual practices, and contained handwritten notes all over the pages, e.g. sample with outlying surrogate recoveries are reanalyzed.
- The SOP was not clearly written.
- The SOP did not address the preparation of the standards.
- ARI's Quality Assurance did not conduct audits of the semi-volatiles GC/MS.
- Mr. Don Patton, Final Data Reviewer (FDR), reviewed all manual data integrations. Quality Assurance was not included in this loop.
- Although all major instruments of the GC/MS section had maintenance logs, the pages were not numbered, and the logbooks were not attached to each instrument.
- The maintenance logs did not describe the verification measures to demonstrate a return to normal operation following major service.
- The log entries contained the date and description of the problem, but no signature of the analyst or the operator.

2.1.3.3.6 Total Petroleum Hydrocarbons (EPA Method 418.1)

- The surrogate used for EPA Method 418.1 did not have an expiration date on it. All

standards must have a date of preparation and expiration on the label.

- The standard #S0321945 could not be traced from the run log book to the working standard log book.

- There was no way to trace another standard (#254-38) to the working log book as the standard appeared to have been mislabeled.

- No corrective action was present for the value below the warning level nor for those values indicating a possible trend or bias. Tetra Tech recommended that control charts for this method must be reviewed by ARI's Quality Assurance for the detection of trends or bias.

- Documentation of the out-of-control event was not clearly elucidated.

- The SOP for EPA Method 418.1 could not be located. As a result, no SOP for this method was reviewed. An SOP for this method must be established by ARI prior to the receipt of environmental samples from the RI/FS work effort at Kotzebue LRRS.

- The preventative maintenance log book was not located with the FTIR instrument and could not be reviewed.

- *Tetra Tech's auditors recommended that no USAF samples be sent to ARI for analysis by EPA Method 418.1 until the deficiencies identified during this audit had been corrected.*

2.1.3.4 Data Packages

Tetra Tech reviewed a U.S. Army Corps of Engineers data package, as a typical Sample Delivery Group (SDG).

- The EPA Method 8270 surrogates were outside control limits, but had not been flagged in the package.

- The pages were not numbered. Tetra Tech requested that all USAF data package pages be consecutively numbered.

2.1.3.5 Analyst Training

- Analyst training documentation was not complete.

2.1.4 Resolution of Audit Findings and Deficiencies

During a debriefing meeting on 25 March, 1994, all the issues raised above were discussed in detail with ARI's laboratory management and the section supervisors; deadlines were agreed upon for the delivery of finalized SOPs, etc. prior to the receipt of any USAF samples.

ARI's corrective actions in response to the audit findings were documented and submitted to Tetra Tech

in three communications, namely, 25 April, 28 May and 3 June, 1994. A follow-up one date verification visit by Tetra Tech's Project Manager Mr. R. Carr found ARI's responses satisfactory and operational.

Tetra Tech conducted the AFCEE contract required audit of ARI, i.e. within 10 working days after receiving the first USAF samples, on 28 June-1 July, 1994. The audit essentially confirmed Mr. Carr's positive findings. Dr. G. Kassakhian, and Ms. S. Pacheco were the Tetra Tech auditors.

The laboratory SOPs, including the ones prepared or modified as a response to Tetra Tech's audit, were all submitted to the AFCEE's review as an Appendix to the QAPP. The AFCEE's Consulting Chemist Mr. Burt Harrison commented positively on the quality of the QAPP and the SOPs, and suggested only minimal edits.

Tetra Tech recommended that ARI be selected as an approved laboratory to receive environmental samples collected at the Kotzebue LRRS.

3.0 RAW DATA AND MAGNETIC TAPE AUDITS

3.1 Introduction

The purpose of raw data and magnetic tape audits is to determine the degree to which the raw data matched the reported results sent to Tetra Tech and whether the laboratory was using the Quality Control (QC) criteria stated in the QAPP Supplement during data reduction and reporting. The Magnetic Tape Audit consists of the examination of organic Performance Evaluation (PE) sample results.

3.2 Organics Raw Data Audit Methodology

The following is an outline of the procedure followed to audit the organics raw data. All calculations are based on the values from the computer output of the analytical instrument used to generate the raw data. The original raw data sheets must be used and not photocopies of the raw data.

- The tuning standards for GC/MS Methods are checked for ion intensity criteria as listed in each method.
- The initial and/or continuing calibrations are checked by calculating the Calibration Check Compounds (CCC) and the System Performance Check Compounds (SPCC) for each calibration, and comparing these values to the values reported in the SDGs. They should agree within 1%.
- The Laboratory Control Samples(LCS) recoveries are calculated for 10% of the compounds and then compared to SDG percent recoveries.
- The Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries were calculated by using values from 10% of the spiked compounds. Calculate the % RSD for the same 10% and compare to the SDG data.

- Calculate the surrogate recovery for the blank, LCS, MS/MSD and the sample the MS/MSD was derived from. Ten percent of the environmental samples should also be calculated. Compare with SDG results.

- Visually inspect the chromatograms for the blank, the low level standard, and 10% of all other runs. Look for peaks unlabeled or crossed out, get an explanation for these peaks. Check to see that the elution order is correct.

- Check that the 12 hour time clock for GC/MS methods was observed for all samples, standards, spikes and blanks.

- When the raw data match the SDG data there is no discrepancy to be reported, and the statement "The raw data support the reported results." will be used.

3.2.1 Calculation Formulas for Organic Raw Data Audit

- Response Factor = $\frac{\text{(Response of Analyte)(Conc. of Internal Standard)}}{\text{(Response of Internal Standard)(Conc. of Analyte)}}$

- % Difference = $\frac{\text{(Response Factor I - Response Factor from Daily Cal.)(100)}}{\text{Response Factor from Initial Cal.}}$

- % Relative Standard Deviation = $\frac{\text{(Std. Deviation of Response Factors)(100)}}{\text{Mean of Response Factors}}$

- % Recovery = $\frac{\text{(Measured Value for Reference Compound)(100)}}{\text{True Value for Reference Compound}}$

3.3 Inorganics Raw Data Audit Methodology

The following is an outline of the procedure followed to audit the inorganics raw data:

- Choose an SDG to review. If a PE sample was submitted to the laboratory, include its SDG in the audit.

- Obtain the raw data for the SDG of interest, including instrument printouts, strip charts and copies of analyst's notes.

- Review the SDG's laboratory case narrative. Verify any discrepancies or out of control instrumentation in the SDG and the raw data.

- Find the EPA Method SW6010 results in the SDG and the raw data package.

- Choose a sample from the SDG to review. Find the corresponding sample results in the raw data package.

- Compare the analytical results and analysis date in the SDG to the results and date from the raw data package.

- For soil samples, confirm calculations accounting for percent solids content. Confirm Matrix Spike percent recoveries and relative percent difference between MS/MSD and duplicate samples.

- Compare and confirm QC results reported in the SDG, the raw data package and the QAPP for:

    - Initial and Continuing Calibrations Verifications;
    - Initial and Continuing Calibration Blanks;
    - Matrix Spikes, Matrix Duplicates and/or Matrix Spike Duplicates;
    - Method Blanks and Laboratory Control Samples.

- Document any and all discrepancies found. Immediately contact the department manager, section manager or analyst to discuss and resolve any discrepancies found between the SDG, the raw data package and the QAPP. Completely document the resolution and/or explanation of any discrepancies.

- When all discrepancies are resolved (or none are found), repeat the review procedure for other samples in the SDG. Then repeat the review procedure for all other methods.

Acronyms used for inorganic review:

CCB: Continuing Calibration Blank
CCV: Continuing Calibration Verification
ICB: Initial Calibration Blank
ICV: Initial Calibration Verification
LCS: Laboratory Control Sample
MBAS: Methylene Blue Activated Substances
MS: Matrix Spike
MSD: Matrix Spike Duplicate
PBW: Preparation Blank, Water
TDS: Total Dissolved Solids

3.3.1 Calculations for Inorganics Raw Data Audit

Calculations for soil samples are confirmed from the raw data and the preparation log to the results reported in the SDG using the following calculation:

SDG result (mg/Kg) = instrument result (mg/L) * prep log conversion (L/g) * (1000 g/Kg)

3.4 Magnetic Tape Audit Methodology

Review all pertinent SDG data concerning the PE sample, the data files, directory files and data output files. Determine the names for the following:

- Initial Calibration with associated BFB Tune;
- Continuing Calibration(s) with associated BFB Tune(s);

- Method Blank(s);
- MS/MSD Samples;
- LCS Sample(s);
- PE Sample and any dilution(s).

For one PE Sample the minimum files needed are twenty-three. After verifying that the correct files were downloaded without corruption, the files are then renamed in order that, during manipulations for audit purposes, no original files are overwritten. Overwritten files may cause re-downloading of the magnetic tape.

At this point the data from the hard copy SDG and the results from the analyst's raw data and the downloaded computer data output files are compared to each other. Any discrepancies are noted. Assuming the Quant ID File has not changed global method parameters significantly, and the distinct and separate Calibration File Program has likewise not changed, the initial calibration data files are reprocessed and the Calibration File Program then operates on the initial calibration reprocessed data output files. Again, assuming these data output files were correctly integrated by the computer and no significant manual integration was needed, the average response factors generated by the Calibration Program are imported into the Quant ID File. For EPA Method 8260, these are the response factors for all applicable quantification, however, this is true only if the continuing calibration that is reprocessed, meets CCC and SPCC criteria. If the CCC or SPCC fail criteria, either the Initial Calibration data files or Continuing Calibration data file are wrong, or a computer/operator integration has occurred incorrectly.

If all criteria are correct, then the remaining data files are reprocessed and the resulting data output files are compared to the reported SDG results. *These are the critical values that the tape audit verifies. Any discrepancies are noted and are identified as issues that need to be resolved.*

3.5 Raw Data Audit Summary

The Magnetic Tape and 5% Raw Data Audit of ARI, Seattle, Washington, was conducted on 27-30 September, 1994. At the time of the audit, ARI had already produced a total of 7 SDGs for the RI/FS at the Kotzebue LRRS.

The purpose of this audit was to determine the degree in which the raw data matched the reported results sent to Tetra Tech in SDG H686 (Inorganics and AK 102 Methods only) and the Performance Evaluation (PE) Sample in SDG H753 (All Organic and Inorganic Methods).

3.5.1 List of Auditors and ARI Personnel at the Orientation Meeting (27 September 1994)

Tetra Tech, Inc. Auditors: Ms. Lisa L. Arrasmith, Data Auditor, (San Bernardino, California)
Mr. Michael Wilson, Auditing Chemist, (San Bernardino, Califorina)

ARI Personnel: Mr. John Hicks, Project Manager
Ms. Michelle Turner, Manager, Quality Assurance
Ms. Suzanne Kitwin, Quality Assurance Coordinator

Orientation Meeting: 10:30 am, Tuesday, 27 September 1994.

3.5.2 Organics Audit Results

3.5.2.1 Organochlorine Pesticides and Polychlorinated Biphenyls (EPA Method 8081)

Analyst Interviewed: Mr. Peter Kepler

After reviewing several SDGs, six data quality issues were identified which required resolution. These issues and their explanations were as follows:

- Use of the "Y" qualifier which increased PQLs

  Due to large concentrations of hydrocarbon contamination which eluted across retention time windows for several pesticides, the laboratory compensated for this background interference by increasing the PQL and flagging it with the "Y" qualifier. However, this practice is difficult to defend analytically since it is subjective in nature, and not addressed by EPA Method 8081.

  Qualifying the PQL, may give the appearance that the lab is relinquishing its responsibility to determine low level concentrations of Pesticides and Polychlornated Biphenyl (PCB) analytes. In addition, the Air Force's database format is incompatible with increased PQLs for individual analytes.

  After talking to the laboratory, it was agreed that the "Y" qualifier would be replaced with a "Z" qualifier. The "Z" qualifier impacts the result only and does not raise the PQL. In a Memorandum of Understanding (MOU) document which was authorized and signed by Mr. Roderick Carr (Project Manager, Tetra Tech, Inc.), Mr. Michael Wilson (Auditor, Tetra Tech, Inc.), and Mr. John Hicks (Project Manager, Analytical Resources, Inc.), the "Z" qualifier was defined and an agreement was reached.

- Use of the "X" qualifier which had two contradicting definitions

  In a similar situation as with the "Z" qualifier, the "X" qualifier is used to denote results which, in the opinion of the analyst, are not true hits for target analytes, and are artifacts due to hydrocarbon contamination. However, the "X" qualifier is used when definite peaks in the correct retention time window, on both columns, are observed but peak areas and/or peak shapes between each column are not consistent with standard values. The use of the "X" qualifier seems appropriate in these situations where heavy contamination exists. However, the case narrative gives one definition and the report forms give another definition. The case narrative definition is the correct definition.

- Large variations in analyte concentrations between dilutions

  When target analytes are detected at concentrations above the calibration range, a dilution is needed to bring the concentration back into the calibration range. Other target analytes detected which were not overrange are again detected in the dilution analysis, however the concentration calculated from the dilution shows a large increase. This increase is due to

quantitation inaccuracy at the bottom of the calibration range. This relatively small quantitation error is then multiplied by the dilution factor which produces the large error reported on the data sheets. However, this issue should not be a problem since those analytes that caused a sample to be run at dilution due to their overrange concentration results, should be the only valid values taken from a diluted run.

- Lack of Gel Permeation Clean-up for contaminated samples

  Gel Permeation Clean-up (GPC) is used to reduce the amount of high molecular weight compounds, such as resins or polymers, that may interfere in an analysis. This type of clean-up is usually associated with soil extracts. The soil samples for this project were contaminated with low molecular weight compounds such that GPC has little effect on reducing interfering contamination. Since several samples were subjected to GPC and showed no effect in reducing contamination, this clean-up method was halted. The normal Florisil clean-up was used on contaminated samples as per the method.

- Apparent blank contamination requiring qualifiers

  On occasion, the blank showed some contaminations which were qualified with the "X" qualifier, which indicates the interferences are not target analytes. The method does not require a flat baseline for the blank, but does require the absence of target analytes. Therefore, the lab is compliant with method blank requirements.

- Surrogate control limits differ between QC and environmental samples

  For this method the surrogate control limits for the blank and laboratory control samples (LCS) are different than the surrogate control limits for the environmental samples. It would normally be expected that the blank and LCS surrogate control limits would show tighter values given the reagent water matrix. However, the opposite is true and the apparent reason being the smaller population of QC data points relative to the much larger population of environmental data points, has an inherently lower confidence level which translates to wider limits.

Conculsions

The raw data for EPA Method 8081 matched the reported results for the SDG H753 P.E. sample. No certified analytes were missed, and after inspection of the raw data, all calculations and use of the "X" qualifier were correct and justified.

3.5.2.2 Volatile Organic Compounds (EPA Method 8260)

Analyst Interviewd: Ms. Jane Alexander

During audit preparation several issues came to light which needed resolution. These issues are as follows:

- Use of the "Y" qualifier which increased PQLs

Due to large concentrations of hydrocarbon contamination which eluted across retention time windows for several volatile compounds, the laboratory compensated for this background interference by increasing the PQL and flagging the PQL it with the "Y" qualifier. However, this practice is difficult to defend analytically since it is subjective in nature, and not addressed by EPA Method 8260. The usual protocol for dealing with contaminated samples or extracts suggests the sample should be diluted since no column clean-up is used for this method. Qualifying the PQL may give the appearance that the lab is relinquishing its responsibility to determine low level concentrations of volatile analytes. In addition, the USAF's database format is incompatible with increased PQLs for individual analytes.

After talking to the laboratory, it was agreed that the "Y" qualifier would be replaced with a "Z" qualifier. The "Z" qualifier impacts the result only and does not raise the PQL.

- Use of the "X" qualifier which had two contradicting definitions

  The resolution of this issue was similar to the one discussed above for EPA Method 8081.

- Surrogate control limits differ between QC and environmental samples

  For this method the surrogate control limits for the blank and laboratory control samples (LCS) are different than the surrogate control limits for the environmental samples. It would normally be expected that the blank and LCS surrogate control limits would show tighter values given the reagent water matrix. However, the opposite is true and the apparent reason being the smaller population of QC data points relative to the much larger population of environmental data points, has an inherent lower confidence level which translates to wider limits.

Conclusion

The raw data for EPA Method 8260 matched the reported results for the SDG H753. One certified analyte was missed and during the magnetic tape audit the reason was clearly determined to be analyst oversight. A discussion of this error is contained in the Magnetic Tape Audit Findings section 3.5.4 of this report.

3.5.2.3 Semi-Volatile Organic Compounds (EPA Method 8270)

Analyst Interviewed: Miss Liz Anderson

During audit preparation several issues came to light which needed resolution. These issues are as follows:

- Absence of GPC clean-up for highly contaminated samples

  Since several samples were subjected to GPC and showed no effect in reducing contamination, this clean-up method was halted. Failing GPC clean-up, contaminated extracts for EPA Method 8270 are usually diluted.

- Use of the "Y" qualifier which increased PQLs

This issue was resolved in a manner identical to those for th EPA Methods 8081 and 8260 above.

- Use of the "X" qualifier which had two contradicting definitions

  The resolution of this issue was similar to the one discussed above for EPA Method 8081.

Conclusion

The raw data matched the reported results in SDG H753. No certified analytes were missed.

3.5.3 Inorganics Audit Results

3.5.3.1 Metals (EPA Method 6010 ICP)

SDG Reviewed: H686

Samples reviewed:
H686L = SS07-SD1-01 (soil)
H686N = SS07-SD3-01 (soil)
H686E = SS07-SW3-01 (total)
H686F = SS07-SW3-01 (dissolved)

All values checked were found to correspond.

Calibration Verifications (ICVs & CCVs) and Calibration Blanks (ICBs & CCBs):

Calibration results are not included in level I data packages, however, the calibrations were in the raw data at the correct frequency. Any out of control calibrations and their associated samples were rerun as noted in the SDG case narratives.

Method Blanks (PBW, PBS): All values checked were found to correspond.

Matrix Spike/Matrix Spike Duplicates/Matrix Duplicates (MS/MSD/MD) :
All values checked were found to correspond.

Laboratory Control Sample (LCS): All values checked were found to correspond.

Although all the raw data values checked were found to correspond to the values in the SDG, there were several discrepancies within the SDG and the QAPP.

1. The manganese PQL was reported on page 167 as 0.00 mg/L. The MDL study included in the SDG for ICP metals in water dated 5/94 indicates a manganese PQL of 0.01 mg/L. This discrepancy appears to be a typographical error. Replacement pages from ARI would be sufficient to correct the problem with no impact to data quality.

2. Thirteen dissolved metal PQLs are not consistent with the total metals, the QAPP or MDL study included in the SDG for ICP metals in water dated 5/94. This discrepancy could result in inconsistent "J" flagging of the data in Tetra Tech's Level I review. ARI should review their data packages and submit replacement pages for all of the affected data.

3.5.3.2 Metals (EPA Method 7000 Series)

SDGs Reviewed: H686

Samples reviewed: H686L = SS07-SD1-01 (soil)
H686N = SS07-SD3-01 (soil)
H686E = SS07-SW3-01 (total)
H686F = SS07-SW3-01 (dissolved)

All values checked were found to correspond.

Calibration Verifications (ICVs & CCVs) and Calibration Blanks (ICBs & CCBs):

Calibration results are not included in level I data packages, however, the calibrations were in the raw data at the correct frequency. Any out of control calibrations and their associated samples were rerun as noted in the SDG case narratives.

Method Blanks (PBW, PBS): All values checked were found to correspond.

Matrix Spike/Matrix Spike Duplicates/Matrix Duplicates (MS/MSD/MD) :
All values checked were found to correspond.

Laboratory Control Sample (LCS): All values checked were found to correspond.

Although all the raw data values checked were found to correspond to the values in the SDG, there were discrepancies within the SDG and the QAPP. The lead PQL in the SDG is 0.006 mg/L, however, the lead PQL in the QAPP and the MDL study included in the SDG is 0.004 mg/L. This discrepancy could result in inconsistent "J" flagging of the data in Tetra Tech's Level I review. ARI should review their data packages and submit replacement pages for all of the affected data.

3.5.3.3 Diesel Range Hydrocarbons (Alaska Method AK102)

SDGs Reviewed: H686

Samples Reviewed:	H686E	SS07-SW3-01
	H686D	SS07-SW2-01
	H686C	SS07-SW1-01
	H686J	SS12-SW3-01
	H686H	SS12-SW1-01 (and dilution)
	H686I	SS12-SW2-01 (and dilution)
	H686A	SS12-SW4-01

Calibration Verifications (ICVs & CCVs) and Calibration Blanks (ICBs & CCBs):

Calibration results are not included in Level I data packages, however, the calibrations were in the raw data at the correct frequency. Any out of control calibrations and their associated samples were rerun as noted in the SDG case narratives.

Method Blanks (PBW, PBS): All values checked were found to correspond.

Matrix Spike/Matrix Spike Duplicates/Matrix Duplicates (MS/MSD/MD) : All values checked were found to correspond.

Laboratory Control Sample (LCS): All values checked were found to correspond.

Surrogate Recoveries: The percent recoveries found in the SDG were calculated correctly.

The aqueous surrogate spike concentration in the raw data is 0.045 mg/L, however the spiking concentration listed in the QAPP or the 7 July 1994 SOP is 0.075 mg/L. The analyst indicated that the QAPP and the SOP both need to be revised and that the 0.045 mg/L spiking concentration listed in the raw data is correct.

Although the raw data values checked were found to correspond to the values in the SDG, there were discrepancies within the SDG and the QAPP. The diesel PQL in the SDG was 0.11 mg/L for water and 7.1 mg/Kg for soil, however, the QAPP and the MDL study included in the SDG list a diesel PQL of 0.2 mg/L for water and 3 mg/Kg for soil. This discrepancy could result in inconsistent "J" flagging of the data in Tetra Tech's Level I review. ARI should review their data packages and submit replacement pages for all of the affected data.

3.5.4 Magnetic Tape Audit of Performance Evaluation Sample H753

A Magnetic Tape Audit for the PE sample H753 was conducted on-site for EPA Methods 8260 and 8270. The Magnetic Tape Audit was initiated by downloading the data from the magnetic tape to the hard drive of the Finnigan Incos 50 MS Data System Computer. The tape audit was focused on EPA Method 8260 results, since an error had been detected only in this method and not in EPA Method 8270 results.

Carbon Tetrachloride (CCl_4) was the analyte missed in the PE sample, H753 for Method 8260. After reloading the tape, a peak with a mass spectra consistent with and at the correct retention time for, CCl_4, was observed. At this time, the peak was manually integrated and gave a value of 17.0 ng/ml, which was exactly the certified value. A diagnostic report was generated for this run when the sample was originally analyzed, and was again generated during this audit. The diagnostic report functions in such a way as to show all ion specific area responses, within the compounds retention time window, other QC parameters not withstanding. From the diagnostic report it was verified that the CCl_4 was indeed there, however, the top of the ion peak was missed, which caused this hit to be rejected. After examining the initial diagnostic report, the same information was observed, and at this point the Analyst admitted this information had been overlooked, and took responsibility for missing this analyte.

3.5.5 Debriefing Meeting

10:30 am, Friday, 30 September 1994

Tetra Tech, Inc. Personnel:	Mr. Rodrick Carr, Project Manager (Redmond, Washington) Ms. Lisa Arrasmith, Data Auditor, Quality Assurance (San Bernardino, California) Mr. Michael Wilson, Auditing Chemist, Quality Assurance (San Bernardino, California)
ARI Personnel:	Mr. John Hicks, Project Manager Mr. Brian Beebe, Organics Supervisor Mr. Peter Kepler, GC Supervisor Mrs. Suzanne Kitwin, Quality Assurance Coordinator

Findings:

- **Organic PE Sample-** For the organic section of PE sample H753, the laboratory missed only Carbon Tetrachloride in Method 8260, the reason being an analyst oversight on the diagnostic report. There was one false positive hit detected which was acetone for Method 8260 at 16 ug/ml. However, our experience with this analyte in PE samples indicates, although claimed not to be a certified analyte, is indeed present in the PE sample as a contaminant.

- **Inorganic PE Sample-** For the inorganic section of PE sample H753, no analytes were missed, although there were three false positive detections. The three false positives were Calcium at 0.06 mg/L, Potassium at 0.7 mg/L, and Sodium at 0.2 mg/L with Calcium and Sodium also detected in the blank. Calcium was detected below the Practical Quantitation Limit (PQL) and Sodium was detected at the PQL. The evidence indicates these are laboratory contaminants and not from the PE sample. Potassium was detected above the PQL but not in the blank, however Potassium is a ubiquitous compound and with the data available, no determination of the source can be elucidated.

- **Qualifier Agreements-** The qualifiers "Y" and "X" have been addressed and agreements were made to smooth out any data quality misunderstandings that may have developed due to their use.

- **EPA Method 6010** - All raw data values checked were found to correspond to the values reported in the SDG. However, there were several discrepancies within the SDG and the QAPP. For example, the manganese PQL was reported on page 167 as 0.00 mg/L. The MDL study included in the SDG for ICP metals in water dated 5/94 indicates a manganese PQL of 0.01 mg/L. Thirteen dissolved metal PQLs are not consistent with the total metals, the QAPP or MDL study included in the SDG for ICP metals in water dated 5/94.

- **EPA Method 7000s** - All raw data values checked were found to correspond to the values reported in the SDG. The discrepancies within the SDG and the QAPP are the lead PQL in the SDG is 0.006 mg/L, however, the lead PQL in the QAPP and the MDL study included in the SDG is 0.004 mg/L.

- **Method AK 102 Diesel Range Hydrocarbons** - The aqueous surrogate spike concentration in the raw data is 0.045 mg/L, however the spiking concentration listed in the QAPP or the 7 July 1994 SOP is 0.075 mg/L. The analyst indicated that the QAPP and the SOP both need to be revised and that the 0.045 mg/L spiking concentration listed in the raw data is correct.

Conclusions and Recommendation

- *Overall, ARI produces high quality chemical analyses. The data ARI generates are indicative of the high standards of integrity the analysts demonstrated during the audit.*

- *Although highly contaminated samples were sent for analysis to ARI, the laboratory has consistently given results that show good laboratory practices were being followed.*

- *When the analysts make procedural changes to maintain the highest level of data integrity, SOPs need to be updated immediately and submitted to Tetra Tech so that the QAPP too can be updated immediately.*

- *ARI should submit replacement pages for the detection limit discrepancies noted in order to prevent erroneous "J" flagging in the Tetra Tech data review process and eliminate future confusion, while preserving data quality.*

Overall Analytical Resources Inc. has performed within the scope of work prescribed for this work effort. At this time ARI's deliverables are expected to meet all data quality objectives.

4.0 LABORATORY PERFORMANCE EVALUATION SAMPLES

Performance evaluation (PE) samples are sent to subcontracting analytical laboratories to assess their analytical performance, precision and accuracy. The PE sample is a prepared sample with known certified concentrations of selected analytes which can be compared to the laboratory analytical results.

The samples were prepared by the nationally reputable commercial vendor, Environmental Resource Associates (ERA) of Arvada, Colorado. The PE sample contained a predetermined number and concentration of analytes for each method. The complete results of these PE samples are on file and archived at Tetra Tech's Redmond, Washington and San Bernardino, California offices.

Tetra Tech contracted ERA to prepare PE samples in Tetra Tech sample containers. Theses were received by Tetra Tech on 12 July, 1994. The PE samples were then relabeled with Kotzebue LRRS labels and shipped to ARI together with actual environmental samples from Kotzebue LRRS.

On July 14, 1994, ARI received the PE samples (ERA Lot No. 0711-94-02) and analyzed them by the following methods:

- Alaska AK102 for Diesel Range Hydrocarbons;
- EPA Methods 6010 and 7000 series for Metals;
- EPA Method 8081 for Pesticides and PCBs;
- EPA Method 8260 for Volatile Organics; and
- EPA Method 8270 for Semivolatile Organics.

The PE samples were received in good condition and assigned ARI laboratory identification as follows:

Kotzebue Sample ID	Laboratory Sample ID	Analytical Method
AOC10-SB1	H753D	AK102
AOC10-SW1	H753O	EPA 6010, 8081, 8260, 8270

After reviewing the reported results from ARI and the certified values with acceptance limits from ERA, the laboratory appears to have failed only two analytes. The percent correct were calculated for each method and tabulated below:

Analytical Method	Percent Correct	Number of Analytes Correctly Identified/Total Analytes
AK102	100%	1/1
EPA 6010	100%	20/20
EPA 8081	100%	1/1
EPA 8260	87%	13/15
EPA 8270	100%	21/21

Concerning the EPA Method 8260 PE sample results, two errors were detected. The first error was the false positive detection of acetone at 16 ug/L. Acetone was not a certified analyte, as stated by the vendor, and may be a contamination from the laboratory, however acetone was not detected in the method blank. The laboratory could not determine a reason for the acetone presence.

The second error concerned carbon tetrachloride. Carbon tetrachloride (CCl_4) was the analyte missed in the PE sample, H753 for Method 8260. After reloading the magnetic tape onto the system computer, the original raw data was examined. A peak with mass spectra consistent with and at the correct retention time for, CCl_4, was observed. At this time, the peak was manually integrated and gave a value of 17.0 ng/ml, which was exactly the certified value. A diagnostic report was generated for this run when the sample was originally analyzed, and was again generated during the audit. The diagnostic report functions

in such a way as to show all ion specific area responses, within the compounds retention time window, other QC parameters not withstanding. From the diagnostic report it was verified that the CCl_4 was indeed there, however, the top of the ion peak was missed, which caused this hit to be rejected. After examining the initial diagnostic report, the same information was observed, and at this point the Analyst admitted this information had been overlooked, and took responsibility for missing this analyte.

Conclusion:

For each method, except EPA Method 8260, the laboratory has performed adequately with a percent correct (within the certified acceptance limits) of 100%. However, the results for the volatile organic analysis EPA Method 8260 indicate the percent correct to be 87%. Normally, 90% is required to be the minimum acceptable value to pass the PE results criteria. However, due to the possibility that the false positive detection of acetone may be due to vendor contamination, since no acetone was detected in the method blank or other samples in the batch, 87% passes in this situation. Therefore, ARI performance was considered to have passed the overall PE results criteria.

5.0 Audits of Deliverables

5.1 Data Validation/Verification Review

The analytical data that resulted from environmental samples collected during the work effort at Kotzebue LRRS, were reviewed against the relevant criteria specified in Tetra Tech's original Statement of Work referred to as Level I criteria, as well as those provided in Tetra Tech QA's SOP entitled "*Preliminary Draft SOP for Quality Assurance Monitoring of Data Deliverables*" (effective date 26 January, 1995). An SOP entitled "*Data Qualification Guidelines for Inorganic & Organic Data Review Level I*" (effective date 7 March, 1994) was used to evaluate the data by Tetra Tech's Data Management Group. After reviewing the SDG against Level I SOP criteria, the Data Management Group compiles the necessary qualifiers and descriptors in tandem with input into the Informal Technical Information Report (ITIR).

Quality Assurance reviews the data verification/validation effort at two levels:

1. The qualifiers and descriptors applied to the sample results found in the ITIR; and
2. The qualifiers and descriptors found in the copy of the Sample Delivery Group (SDG) laboratory deliverable.

Compliance with the Level I Verification SOP included a review of the following technical components:

- Analytical holding times;
- Method and field blank results;
- Matrix spikes/matrix spike duplicate results;
- Surrogate recovery;
- Laboratory control sample results;
- Temperature blank results;
- Duplicate environmental sample results; and
- The SDG supplied case narrative.

The QA Auditor notes the discrepancy in a memo to be forwarded to the Project Manager and Project QA/QC Manager with a copy to the Data Management Group Manager.

- Why the condition was evaluated as a discrepancy;
- Where in the validation/verification portion of the ITIR the discrepancy was found; and
- Solutions for the discrepancies.

Once the discrepancy memo was issued, QA set a date for incorporation of suggested edits, followed by a request of documentation that indicated that the discrepancies had been resolved.

5.2 ITIR Review

Tetra Tech's Data Management Group prepared the Summary of Environmental Results, Surrogate Summary and Summary of Quality Control Sample portions of the ITIR. As ITIR sections were generated, QA reviewed those sections for the following elements:

- That the MDLs and PQLs were consistent with those in the QAPP;
- Units of concentration were consistent with those in the QAPP;
- The correct presentation of sample results that required dilutions; and
- The correct presentation of sample results that required second column confirmational analysis.

Any discrepancies were noted by the QA Auditor in a memorandum to the Project Manager, Project QA/QC Manager and Data Management Group Manager. It included the following information:

- Why the condition was evaluated as a discrepancy;
- Where in the ITIR portions the discrepancy was found; and
- Solutions for the discrepancies.

Once the discrepancy memorandum is issued, QA sets a date for the incorporation of the suggested edits. For a period of time QA continues to monitor the implementation of the corrective action. All documentation of the corrective actions used by QA to resolve the discrepancy are then forwarded to the Data Management Group Manager and the Project Manager.

5.3 Installation Restoration Program Information Management System (IRPIMS) Review

Due to the restrictive nature of the IRPIMS deliverable, it was not possible for QA to review it in its final electronic deliverable state. Deliverables in a stage prior to the final one were reviewed by QA using a Tetra Tech proprietary program which provides an output on a method specific basis and is known as the "Greenbar Report". The report is reviewed against the relevant SDG for the following elements:

- Detection limits;
- Quality control limits, spiking levels and relative percent difference for duplicate samples;
- Concentrations of analytes of concern;
- Why the condition was evaluated as a discrepancy;
- Where in the "Greenbar" report the discrepancy was found; and
- Solutions for the discrepancies.

The review of the "Greenbar Report" documented the differences between the IRPIMS deliverable and the hardcopy; this information was forwarded to the Project Manager, Project QA/QC Manager and the Data Management Manager.

QA set a date for the incorporation of the suggested edits and requested documentation that the discrepancies have been resolved. For a period of time QA monitored the activity for compliance. All documentation of the corrective actions used by Tetra Tech's QA to resolve the discrepancy was forwarded to the Project Manager and the Data Management Manager.

Table II presents the QA audits performed on the Tetra Tech deliverables:

Table II
Audits of Tetra Tech Deliverables

Date Of Audit	Auditor	Type Of Audit	Quality Assurance Activities	Documentation
			Data Validation Audit	
18 January, 1995	Mr. M. Wilson	Data Validation	Audit of Level I Data Validation of SDGs H819 and H886	Letter dated 18 January, 1995, detailing findings from audit
			Third Part Validation Audit	
8 February, 1995	Mr. M. Wilson	Third Party Validation	Audit of EcoChem's 3rd Party Validation of SDG H700	Letter dated 8 February, 1995,detailing the audit findings

5 December, 1994	Ms. S. Pacheco	Compliance	Questions Regarding SDG H834	Letter dated 5 December, 1994 answering questions regarding SDG H834

5.4 Audit Summaries of Deliverables

5.4.1 Audit of Level I Data Validation

Type: Level I Data Validation Audit
Date: 18 January, 1995
Document Audited: SDGs H819 and H886
Auditor: Mr. M. Wilson

Reported Discrepancies:

- **SDG H819** - Endosulfan II was reported in the Data Management Case Narrative (DMCN) to be in the method blank, however it was not detected.
    - Under the Laboratory Control Sample (LCS) heading of DMCN, it was indicated that all recoveries met QC criteria when in fact the entire LCS (Method 8270) was invalid due to the sample running out the 12 hour requirement.
    - Under the General Comments heading of the DMCN the following statement was written "Validation of environmental samples is based on results from the primary column". Since this quote only pertains to Method 8081 samples, the statement was incorrect. The correct statement should have read, "*Quantitation of the environmental results are based on the value from the primary column*". **This item needed global correction.**
    - The DMCN stated "No MS/MSD data were reported due to insufficient sample volume". There needs to be additional information included on why there was no LCS/LCSD analyzed, since this was the corrective action for insufficient sample amounts.
- **SDG H886** - Results from samples that saturated the detector, where the value in the results column was the letter "**S**", had been qualified **J**. In fact, the letter "**S**" should not have been qualified, since it is not a numerical value.
    - The laboratory case narrative (LCN) states that the LCS for EPA Method 8270 ran outside the 12 hour requirement. The DMCN does not indicate this and states the LCS met QC requirements.
    - EPA Method 8081 data had been qualified **J** to indicate doubt as to the analyte's authenticity. These data had been qualified incorrectly since **J** had nothing to do with authenticity.

Corrective Action: It was recommended that the inconsistent and incorrect validation be corrected.

Resolutions: *The auditor concluded that the errors and confusing format of the DCMN may not impact risk assessment parameters. The discrepancies were reported to the Data Management and Project Managers.*

5.4.2 Audit of Third Party Data Validation of a Level II SDG

Type: Third Party Data Validation of a Level II SDG
Date: 8 February, 1995
Document Audited: SDG H700
Third Party Validator: EcoChem, Seattle, Washington
Tetra Tech Auditor: Mr. M. Wilson

Reported Discrepancies: **Samples Background-SS3-01, Background-SD3-01, Background-SS2-01, and Background-SD2-01.**

- The samples were contaminated with known hydrocarbon residues which resulted in matrix interferences. The latter will occasionally produce false positive results due to coincidental detection of non-target compounds on both columns.
- These matrix interferences may have resulted in poor peak resolution in some cases.
- The Matrix Spike and Matrix Spike Duplicate (MS/MSD), which was performed on sample Background-SD2-01, showed elevated recoveries due to matrix interferences, however, the precision is acceptable as demonstrated by the Relative Percent Difference (RPD). These facts show adequate pesticide sensitivity on top of non-target interference.
- The baseline drift which is noticeable in all chromatograms, is a common effect caused by the temperature programming which changes the dynamic equilibrium inside the electron capture detector, resulting in drift. Since the drift is observed in all pesticide chromatograms, including instrument blanks for which matrix interferences do not apply, the matrix effected baseline drift theory has not been proven for these samples.
- The possibility of false negative determinations due to negative peak influences would be extremely rare.

Conclusion: *The pesticide data in SDG H700, produced by ARI, had been validated by EcoChem, Inc. using all the raw data associated with the analysis. The validation conducted was found to be consistent with good validation practices and the resulting qualifications were justified with the exception of the qualified PQLs for the samples Background-SS3-01, Background-SD3-01, Background-SS2-01, and Background-SD2-01. Based on all available information discussed above and in a letter dated 8 February, 1995, to Mr. Rick Osgood, Operations Manager,* ***it appears that the Background samples may have been overqualified.***

5.4.3 IRPIMS Audit

Type: IRPIMS Review
Date: 10 February, 1995
Document Audited: Kotzebue LRRS
Document Audited: SDG H569 and its "Greenbar Report"
Auditor: Ms. C. Sisco

Reported Discrepancies:

- EPA Method 8260 - Sample ID A0C5-SS1 - Surrogates were not reported for this sample ID.
- Analyte - Carbon Disulfide - The SDG is reporting ND while the Greenbar Report is reporting 0.
- EPA Method 8270 - Analyte - 2-Nitroaniline - The SDG is reporting ND while the Greenbar Report is reporting 2.2
- EPA Method 6010 - Analyte - Antimony - The SDG is reporting ND while the Greenbar Report is reporting 0.

Corrective Action: These minor discrepancies noted did not affect the overall quality of the deliverable or impact the Data Quality Objectives. Data Management to correct discovered errors.

Resolution: *The Project Manager and Projec QA/QC Manager were informed of the discrepancies. Data Management corrected the erroneous entries.*

5.4.4 Compliance Monitoring

5.4.4.1 Preaudit Package Review

Type: Preaudit Package Review
Date: 17-18 March, 1994
Document Audited: Preaudit Package provided by ARI
Auditor: Mr. M. Wilson

Reported Discrepancies:

- MDL studies reported without the method designation information (EPA Methods 8240 and 8270).
- EPA Method 8240 MDL shows Bromoform to be quantitated under the wrong internal standard.
- There are several instances where the units associated with results are not indicated.

Corrective Action: The observed deficiencies were reported to the Project Manager and ARI's

Project Manager.

5.4.4.2 SDG Review

Type: SDG Review
Date: 1 August, 1994
Document Audited: 1st Sample Delivery Group (SDG) received from ARI
Auditor: Ms. L. Arrasmith

Reported Discrepancies:

- The pesticide analysis (EPA Method 8081) report pages did not include client sample identifications.
- Descriptors or Qualifiers used throughout the SDG were not clearly defined, except for method AK102.
- Surrogate percent recovery control limits should be included on every report page for every applicable method.
- The MS/MSD QC pages should include the control limits as listed in the QAPP.
- The Form I report pages for MS/MSD do not actually report the values recovered.
- The report pages for EPA Method 8260 and Alaska AK102 should read "PQL" instead of "OL".
- Several samples in several methods (A0C1-SB9-1.0 and A0C05-SB5-2.0 in EPA Method 8270 for example) were rerun at 5 and 10 times dilutions, however, it is not clear that the original sample exceeded the calibration range in any way.

Resolutions: *The discrepancies were reported to the Project Manager, who in turn discussed them with ARI's Project Manager. Subsequent SDGs indicated that the above listed issues were rectified in a satisfactory manner.*

5.4.4.3 EPA Method 8081 Compliance Audit

Type: EPA Method 8081 Audit
Date: 22 September, 1994
Document Audited: Various SDGs from ARI
Auditor: Mr. M. Wilson

Reported Discrepancies:

- For the electronic deliverables three values are to be reported. These values are column #1 results, column #2 results, and the primary column result. The laboratory must designate the DB5 column as the primary column in the

electronic format. Thus, column #1 results and the DB5 column results will be identical.

- The **X** qualifier should not be used in the electronic deliverable since this would be inconsistent with the client's database format.

Resolutions: *The findings were reported to the Project Manager and ARI's Project Manager for discussion and resolution.*

5.4.4.4 Use of Qualifiers Generated by ARI for its SDGs

Type: Use of Qualifiers Generated by ARI for its SDGs
Date: 4 October, 1994
Document Audited: Various SDGs from ARI
Auditor: Mr. M. Wilson

Reported Discrepancies:

- Using qualifiers which raise PQL for individual analytes and qualifiers with ambiguous definitions.

Resolutions: *ARI agreed to alleviate data quality issues which are incompatible with data quality objectives.*

5.4.4.5 QAPP/SDG Compliance Monitoring

Type: QAPP/SDG Compliance Monitoring
Date: 28 October, 1994
Document Audited: Kotzebue LRRS SDG H819 from ARI versus QAPP dated 26 July, 1994
Auditor: Ms. C. Sisco

Reported Discrepancies:

- EPA Method 8081 - MDL study for DB5, both Soil and Water results are missing the following analytes: Endolsufan I and Endosulfan Sulfate.
- EPA Method 8260 - MDL study for both Soil and Water results are missing the following analytes: Bromoform and Bromochloromethane.
- EPA Method 8270 - Analytes bis(2-Chloroisopropyl) ether is reported in the QAPP but not reported on the MDL study or on the Analysis Data Sheets pages for EPA Method 8270.

Resolutions: *The discrepancies were reported to the Project and Data Management Managers.*

5.4.4.6 Sample Delivery Group (SDG) Review

Type: Sample Delivery Group (SDG) Review
Date: 5 December, 1994
Document Audited: SDG H834 from ARI

Auditor: Ms. S. Pacheco

Reported Discrepancies:

- The Alaska Method AK101 for Gasoline method blank was contaminated.
- When the result of the analysis is ND, it is inappropriate to use the prevalent ARI case narrative sentence "In the opinion of the analyst, the pattern of the sample was NOT a match for gasoline" .

6.0 Quality Assurance Project Plan Variances for Analytical Resources, Inc. - Seattle Regional Laboratory, Seattle, Washington

- The AFCEE did not approve the request of deleting 1-Chlorohexane and Trichloropropane from EPA Method 8260 unless the analyte list for the QAPP is amended with the concurrence of the Alaska Department of Environmental Conservation (ADEC) and EPA.
- The AFCEE did not approve increasing the PQL for Zinc. The AFCEE recommended that the laboratory repeat their Method Detection Limit studies and make corrective actions to meet the AFCEE reasonable requirement of 0.02 mg/L for ICP analysis for water.
- The AFCEE determined that no variance was required for Cadmium in water by ICP since Analytical Resources, Inc. (ARI) can achieve an PQL of 0.02 mg/L and the Handbook Limit is 0.04 mg/L.
- The AFCEE did not approve increasing the PQL of Aroclor (PCB-1221) from 1 ug/L to 1.1 ug/L on the confirmation column. The confirmation column should, at minimum, achieve the same PQL as the first column.

STANDARD OPERATING PROCEDURE

PERFORMANCE EVALUATION SAMPLES

Tt-QA SOP No. QA001-93

APPROVALS		Date
Auditor	Ms. Lisa L. Arrasmith	
Manager, Quality Assurance	Dr. Garabed Kassakhian	
Program Manager, Quality Assurance	Dr. William Brownlie	

Effective Date _____ Revision _____

LABORATORY PERFORMANCE EVALUATION SAMPLE

STANDARD OPERATING PROCEDURE

Performance Evaluation (PE) samples are sent to subcontracting analytical laboratories to assess their analytical performance, precision and accuracy. The PE sample is a prepared sample with known certified concentrations of selected contaminants which can be compared to the analytical results. To achieve maximum benefit of PE sample results, it is best if the PE sample is sent at, or as near as possible, to the beginning of a project.

There are three types of PE samples:

1. **USEPA PE Samples**

   These samples are prepared by the EPA, and are submitted to the laboratory through the contractor. An identical sample is analyzed by an EPA referee laboratory and the results of the latter are compared to those obtained by the subcontracting laboratory and the true values of the prepared PE samples. The results may or may not be disclosed by the EPA; if disclosed, the results may be as late as 10 to 14 months. The PE samples are supplied by the EPA *gratis*, and the Client bears only the direct cost of analysis, and contractor handling of the samples and paperwork.

2. **Commercial Off-the-shelf PE Samples**

   These are obtainable from nationally reputable commercial outlets, such as Environmental Resource Associates (ERA) (Arvada, Colorado) or Analytical Standards Incorporated (ASI) (Parkersburg, West Virginia), etc. The PE samples contain a preordained number of analytes of interest for each method. Although the samples are shipped to the laboratory by the contractor in containers identical to those used in its field effort, the "picket fence" nature of the chromatograms, and the presence of uncharacteristic analytes immediately alert the laboratory that a PE sample has been submitted.

   This type of PE sample is most useful during the early phases of laboratory selection, immediately after a laboratory audit. Together with the analytical results, a "sample" sample delivery group (SDG) is produced that the contractor reviews for adequacy and completeness of data, and the presence of the Quality Assurance/Quality Control elements that will be required by the QAPP or the CLP SOW.

3. **Customized Commercial PE Samples**

   The PE samples are customized to contain only those analytes that are usually present for the specific project. The concentrations are customized to match the average field concentrations. The samples are prepared in the contractor's containers identical to those used in the field. As was the case with the "off the shelf" PE samples above, the customized PE samples are issued dummy identifications in line with the field sampling numbering system.

An analytical laboratory can detect standard PE samples as soon as the first analysis is run, and that sample will receive special attention. Since the purpose of a PE sample is to measure laboratory

performance under normal conditions, PE samples must be disguised. This can be accomplished in the following manner:

1.0 Ordering and Scheduling

- If the project is ongoing or historical data exists, it is possible to order a customized PE sample to resemble an actual environmental sample. Determine which analytes need to be included in the PE sample, i.e. analytes of concern at the project and/or analytes that have been previously detected. If soil and water samples are to be tested, include both matrices in the PE sample.

- Ensure that all analytes fall at least within five times the laboratory's practical quantitation limit (PQL) or reporting limit. Check the project Quality Assurance Project Plan (QAPP) to find these levels.

- Once the analysis methods, analytes and concentrations have been identified, determine the appropriate type and number of Tetra Tech sample containers needed to submit to the PE sample vendor.

- Contact three PE sample vendors, such as ERA, ASI, etc. and price the sample. Choose the vendor who can offer the PE sample that best fits the requirements for the best price. Instruct the vendor to send a single copy of the certified results marked confidential to one designated Tetra Tech person.

- If the project extends over a period of a month or more, order the PE sample to arrive at the site on a staggered schedule. This will prevent the laboratory from using the wrong sample bottles for the wrong analysis as well as preventing the laboratory from identifying the PE sample as such on the first analysis, and treating the remaining analysis with special attention.

- Analytes with short holding times should not be scheduled for Friday shipment or Monday arrival. The weekend will reduce the holding time remaining for the laboratory. The sampling date entered on the Tetra Tech Chain-of-Custody (COC) must be the PE sample vendors preparation or shipment date. For instance, the PE sample vendor prepares and ships the volatile organic compound (VOC) PE sample Monday. It arrives at Tetra Tech Tuesday where it is recorded, processed shipped to arrive at the laboratory on Wednesday in it's third day of holding time.

  Then schedule the metals PE sample to arrive Tuesday to ship the same day and so forth. Shipping the PE sample in this manner will prevent the laboratory from flagging the PE sample as such.

2.0 PE Sample Receipt

Tetra Tech's receipt of the PE sample cooler from the vendor should be well documented via video recorder or camera. Important things to do and document are as follows:

- The PE sample cooler should be received from the vendor with an unbroken secure seal.

- An intact complete COC from the vendor should accompany the PE sample. Keep the vendor COC in a secure project PE sample file.

- Open the PE sample cooler, verify that the correct type and number of sample containers are present and their labels correspond to the information on the COC.

- Check the PE samples temperature by placing for four minutes a mercury thermometer in the temperature blank that accompanied the PE sample. The temperature should be 4°C ± 2°C. If the temperature exceeds this range contact the project manager before proceeding. Record the temperature of the temperature blank on the Tetra Tech COC.

- Number the PE sample with an ID number similar to a regular sample. Use a site number that does not exist. Exchange the vendor labels on the sample containers for completed Tetra Tech labels. Keep the vendor labels and Tetra Tech PE sample numbers in a secure project PE sample file.

- Record the appropriate PE sample information on a Tetra Tech COC, preferably a COC that already includes environmental samples. The sample date recorded on the COC for the PE sample should be the date prepared by the vendor.

- Ship the PE samples overnight to the laboratory the same day they are received at Tetra Tech if possible.

3.0 PE Sample Result Analysis

The certified results will either accompany the PE sample to Tetra Tech, or arrive within a few weeks of the PE sample. The certified results will give the actual concentration of each analyte in the PE sample and an acceptable range of recovery.

When the PE sample results arrive from the laboratory, compare the results to the vendor's certified results. The easiest way to do this is to comprise a table. The column headings in the table should be:

- Analyte and method.

- Laboratory method detection limit.

- Laboratory practical quantitation or reporting limit.

- Laboratory result (include dilution results and dilution factor).

- Vendor certified value.

- Vendor certified range.

- Good or Fail (good if the laboratory result falls within the vendor certified range, fail if it does not).

The table should include all the analytes included in the vendor's certified results and all the analytes the laboratory reported positive concentrations for. All analytes the laboratory reports within the vendor's acceptable range are good results. If the laboratory reports a positive concentration for an analyte that is not included in the vendors certified results, that is a false positive and a failed analyte. All analytes that fall outside the vendor's acceptable range (including nondetects or false negatives) are failed results.

Compose a letter to the laboratory informing them of the PE sample results. Request that they address any failures by a given date. At this point the laboratory may receive a copy of the vendor's certified values.

Finally, when the laboratory has addressed all their failures satisfactorily, compose a letter to the client informing them of the laboratories performance. Include suggestions, recommendations and conclusions regarding the laboratories future work with Tetra Tech. Also include the vendor's certified values, copies of the original laboratory results and any revised laboratory results.

RAW DATA AND MAGNETIC TAPE AUDITS

Tt-QA SOP No. QA002-93

APPROVALS		Date
Auditor	Ms. Lisa L. Arrasmith	
Manager, Quality Assurance	Dr. Garabed Kassakhian	
Program Manager, Quality Assurance	Dr. William Brownlie	

Effective Date _____ Revision _____

RAW DATA AND MAGNETIC TAPE AUDITS

1.0 Introduction

The purpose of raw data and magnetic tape audits is to determine the degree to which the raw data matched the reported results sent to Tetra Tech, Inc. and whether the laboratory was using the Quality Control criteria stated in the Quality Assurance Project Plan (QAPP) during data reduction and reporting. The Magnetic Tape Audit consists of the examination of organic Performance Evaluation (PE) sample results.

1.1 Organics Raw Data Audit Methodology

The following is an outline of the procedure followed to audit the organics raw data. All calculations are based on the values from the computer output of the analytical instrument used to generate the raw data. The original raw data sheets must be used and not photocopies of the raw data.

- The tuning standards for GC/MS Methods are checked for ion intensity criteria as listed in each method.
- The initial and/or continuing calibrations are checked by calculating the Calibration Check Compounds (CCC) and the System Performance Check Compounds (SPCC) for each calibration, and comparing these values to the values reported in the SDGs. They should agree within 1%.
- The Laboratory Control Samples (LCS) recoveries are calculated for 10% of the compounds and then compared to SDG percent recoveries.
- The Matrix Spike/Matrix Spike Duplicate (MS/MSD) recoveries were calculated by using values from 10% of the spiked compounds. Calculate the % RSD for the same 10% and compare to the SDG data.
- Calculate the surrogate recovery for the blank, LCS, MS/MSD and the sample the MS/MSD was derived from. Ten percent of the environmental samples should also be calculated. Compare with SDG results.
- Visually inspect the chromatograms for the blank, the low level standard, and 10% of all other runs. Look for peaks unlabeled or crossed out, get an explanation for these peaks. Check to see that the elution order is correct.
- Check that the 12 hour time clock for GC/MS methods was observed for all samples, standards, spikes and blanks.
- When the raw data match the SDG data there is no discrepancy to be reported, and the statement "The raw data support the reported results." will be used.

1.1.1 Calculation Formulas for Organic Raw Data Audit

- Response Factor = $\frac{\text{(Response of Analyte)(Conc. of Internal Standard)}}{}$

(Response of Internal Standard)(Conc. of Analyte)

- % Difference = $\frac{\text{(Response Factor I - Response Factor from Daily Cal.)(100)}}{\text{Response Factor from Initial Cal.}}$

- % Relative Standard Deviation = $\frac{\text{(Std. Deviation of Response Factors)(100)}}{\text{Mean of Response Factors}}$

- % Recovery = $\frac{\text{(Measured Value for Reference Compound)(100)}}{\text{True Value for Reference Compound}}$

1.2 Inorganics Raw Data Audit Methodology

The following is an outline of the procedure followed to audit the inorganics raw data:

- Choose a Sample Delivery Group (SDG) to review. If a performance evaluation (PE) sample was submitted to the lab, include its SDG in the audit.

- Obtain the raw data for the SDG of interest, including instrument printouts, strip charts and copies of analyst's notes.

- Review the SDG's laboratory case narrative. Verify any discrepancies or out of control instrumentation in the SDG and the raw data.

- Find the USEPA Method SW6010 results in the SDG and the raw data package.

- Choose a sample from the SDG to review. Find the corresponding sample results in the raw data package.

- Compare the analytical results and analysis date in the SDG to the results and date from the raw data package.

- For soil samples, confirm calculations accounting for percent solids content. Confirm Matrix Spike percent recoveries and relative percent difference between MS/MSD and duplicate samples.

- Compare and confirm QC results reported in the SDG, the raw data package and the laboratory's QAPP for:

    - Initial and Continuing Calibrations Verifications;
    - Initial and Continuing Calibration Blanks;
    - Matrix Spikes, Matrix Duplicates and/or Matrix Spike Duplicates;
    - Method Blanks and Laboratory Control Samples.

- Document any and all discrepancies found. Immediately contact the department manager, section manager or analyst to discuss and resolve any discrepancies found between the

SDG, the raw data package and the QAPP. Completely document the resolution and/or explanation of any discrepancies.

- When all discrepancies are resolved (or none are found), repeat the review procedure for other samples in the SDG. Then repeat the review procedure for all other methods.

Acronyms used for inorganic review:

CCB: Continuing Calibration Blank
CCV: Continuing Calibration Verification
ICB: Initial Calibration Blank
ICV: Initial Calibration Verification
LCS: Laboratory Control Sample
MBAS: Methylene Blue Activated Substances
MS: Matrix Spike
MSD: Matrix Spike Duplicate
PBW: Preparation Blank, Water
TDS: Total Dissolved Solids

1.2.1 Calculations for Inorganics Raw Data Audit

Calculations for soil samples are confirmed from the raw data and the preparation log to the results reported in the SDG using the following calculation:

SDG result (mg/Kg) = instrument result (mg/L) * prep log conversion (L/g) * (1000 g/Kg)

1.3 Magnetic Tape Audit Methodology

Review all pertinent SDG data concerning the PE sample, the data files, directory files and data output files. Determine the names for the following:

- Initial Calibration with associated BFB Tune;
- Continuing Calibration(s) with associated BFB Tune(s);
- Method Blank(s);
- MS/MSD Samples;
- LCS Sample(s);
- PE Sample and any dilution(s).

For one PE Sample the minimum files needed are twenty-three. After verifying that the correct files were downloaded without corruption, the files are then renamed in order that, during manipulations for audit purposes, no original files are overwritten. Overwritten files may cause re-downloading of the magnetic tape.

At this point the data from the hard copy SDG and the results from the analyst's raw data and the downloaded computer data output files are compared to each other. Any discrepancies are noted. Assuming the Quant ID File has not changed global method parameters significantly, and the distinct and separate Calibration File Program has likewise not changed, the initial calibration data files are

reprocessed and the Calibration File Program then operates on the initial calibration reprocessed data output files. Again, assuming these data output files were correctly integrated by the computer and no significant manual integration was needed, the average response factors generated by the Calibration Program are imported into the Quant ID File. For SW-846 Method 8260, these are the response factors for all applicable quantification, however, this is true only if the continuing calibration that is reprocessed, meets CCC and SPCC criteria. If the CCC or SPCC fail criteria, either the Initial Calibration data files or Continuing Calibration data file are wrong, or a computer/operator integration has occurred incorrectly.

If all criteria are correct, then the remaining data files are reprocessed and the resulting data output files are compared to the reported SDG results. *These are the critical values that the tape audit verifies. Any discrepancies are noted and are identified as issues that need to be resolved.*

* In the opinion of the analyst, the relevant compound may not be present at or below the indicated concentration due to interfering background contamination that prevents a positive or negative spectral confirmation.
** Analyte detected above linear calibration range.

bis(2-Chloroethoxy) Methane	0.5		2	ND	U	g								
2,4-Dichlorophenol	1.0		3	ND	U	g								
1,2,4-Trichlorobenzene	0.2		1	ND	U	g								
Naphthalene	0.2		1	ND	U	g								
4-Chloroaniline	2.0		6	ND	U	g								
Hexachlorobutadiene	0.7		2	ND	U	g								
4-Chloro-3-Methylphenol	1.1		3	ND	U	g								
2-Methylnaphthalene	0.6		2	ND	U	g								
Hexachlorocyclopentadiene	2.9		9	ND	U	g								
2,4,6-Trichlorophenol	1.5		5	ND	U	g								
2,4,5-Trichlorophenol	1.3		4	ND	U	g								
2-Chloronaphthalene	0.5		2	ND	U	g								
2-Nitroaniline	1.3		4	ND	U	g								
Dimethyl Phthalate	0.7		2	ND	U	g								
Acenaphthylene	0.6		2	ND	U	g								
3-Nitroaniline	5.4		20	ND	U	g								
Acenaphthene	0.6		2	ND	U	g								
2,4-Dinitrophenol	8.4		30	ND	U	g								
4-Nitrophenol	1.6		5	ND	U	g								
Dibenzofuran	0.6		2	ND	U	g								
2,6-Dinitrotoluene	1.5		5	ND	U	g								

Base: Kotzebue LRRS						Table 2.2.6							
Site: Background Samples						Analytical Data Summary							
Extraction Method: EPA Method 3520						EPA Method 8270							
Analytical Method: EPA Method 8270													
Matrix: Water													
Units: ug/L													
			Environmental Samples										
		Field ID:		MW1-01									
		Batch ID:		H772									
Parameters	MDL		PQL	Result	Validity	Comments							
2,4-Dinitrotoluene	1.3		4	ND	U	g							
Diethyl Phthalate	1.0		3	ND	U	g							
4-Chlorophenyl Phenyl Ether	0.5		2	ND	U	g							
Fluorene	0.5		2	ND	U	g							
4-Nitroaniline	4.5		10	ND	U	g							
4,6-Dinitro-2-Methylphenol	2.7		9	ND	U	g							
N-Nitrosodiphenylamine	0.6		2	ND	U	g							
4-Bromophenyl Phenyl Ether	0.6		2	ND	U	g							
Hexachlorobenzene	0.6		2	ND	U	g							
Pentachlorophenol	3.7		10	ND	U	g							
Phenanthrene	0.6		2	ND	U	g							
Anthracene	0.7		2	ND	U	g							
di-n-butyl Phthalate	1.0		3	ND	U	g							
Fluroanthene	0.6		2	ND	U	g							
Pyrene	0.6		2	ND	U	g							
Butylbenzylphthalate	0.7		2	ND	U	g							
3,3'-Dichlorobenzidine	2.1		7	ND	U	g							
Benzo(a)anthracene	0.6		2	ND	U	g							
bis(2-Ethylhexyl) Phthalate	0.6		2	ND	U	g							
Chrysene	0.6		2	ND	U	g							
di-n-Octylphthalate	0.6		2	ND	U	g							
Benzo(b)fluoranthene	0.6		2	ND	U	g							
Benzo(k)fluoranthene	0.8		3	ND	U	g							
Benzo(a)pyrene	0.7		2	ND	U	g							
Indeno(1,2,3-c,d)pyrene	0.5		2	ND	U	g							
Dibenzo(a,h)anthracene	0.6		2	ND	U	g							
Benzo(g,h,i)perylene	0.5		2	ND	U	g
