1. Introduction

1.1 Background

The DoD Computer-aided Acquisition and Logistics Support (CALs) Test Network (CTN) is conducting tests of the military standard for the Automated Interchange of Technical Information, MIL-STD-1840A, and its companion suite of military specifications. The CTN is a DoD-sponsored confederation of voluntary participants from industry and government managed by the Air Force Materiel Command (AFMC).

The primary objective of the CTN is to evaluate the effectiveness of the CALS standards for technical data interchange and to demonstrate the technical capabilities and operational suitability of those standards. Two general categories of tests are performed to evaluate the standards, formal and informal. Formal tests are large, comprehensive tests that follow a written test plan, require specific authorization from DoD, and may take months to prepare, execute, and report.

Informal tests are used by the CTN technical staff to broaden the testing base by including representative samples of the many systems and applications used by CTN participants. They also allow the CTN staff to gain feedback from many industry and government interpretations of the standards, to increase the base of participation in the CALS initiative, and to respond, in a timely manner, to the many requests for help that come from participants. Participants take part voluntarily and are benefited by receiving an evaluation of their latest implementation (interpretation) of the standards, interacting with the CTN technical staff, gaining experience in use of the standards, and developing increased confidence in them. The results of informal tests are reported in Quick Short Test Reports (QSTRs) that briefly summarize the standard(s) tested, the hardware and software used, the nature of the test, and the results.

1.2 Purpose

The purpose of the informal test reported in this QSTR was to analyze Litton Systems Canada Limited's interpretation and use of the CALS standards in transferring technical publications data. Litton used its CALS Technical Data Interchange System to produce data in accordance with the standards and delivered it to the CTN technical staff on a 9-track magnetic tape.

2. Test Parameters

Test Plan: AFTB 92-04

Date of Evaluation: 20 January 1992

Evaluator: George Elwood
Air Force CALS Test Bed
AFMC/ENCT
4027 Colonel Glenn Hwy
Suite 200
Dayton, OH 45431-1601

Data Originator: Mark James

SUN 3/280

CTN *Tapetools* (v1.2.8) UNIX
Agfa Compugraphics *CALS* v40.4
Cheetah Gold 486
CTN *Tapetools* (v1.2.8) DOS

MIL-M-28001 (SGML)

Cheetah Gold 486

Exoterica *XGML* V1.2e3.2
Datalogics *ParseStation* v3.36

MIL-R-28002 (Raster)

SUN 3/60

CTN Raster Tools
Rosetta Technology *Preview* V3.1
Cheetah
Inset Systems *HiJaak* V2.02
SPC Harvard Graphics V3.0

**Standards
Tested:**

MIL-STD-1840A
MIL-M-28001A
MIL-R-28002

3. 1840A Analysis

3.1 External Packaging

The tape arrived at the Air Force Test Bed enclosed in a box IAW ASTM D 3951. The exterior of the box was not marked with the required magnetic tape warning label, MIL-STD-1840A, para. 5.3.1.3. although it was marked indicating it contained a magnetic tape.

The tape was not enclosed in a barrier bag or barrier sheet material as required by MIL-STD-1840A, para. 5.3.1.2. Inspection of the tape reel showed a lack of the required label indicating the recording density as required by MIL-STD-1840A, para. 5.3.1. No packing list showing all files that were recorded on the tape was included in the box.

3.2 Transmission Envelope

The 9-track tape received by the Air Force Test Bed contained MIL-STD-1840A files. The files were named per the standard conventions.

3.2.1 Tape Formats

The 1840A Tape was run through the AFTB *Tapetool* utility version 1.2.8. One note was generated during the evaluation of the tape contents of the tape labels.

A note was reported on the tape label version. MIL-STD-1840A permits the use of both versions three and four. The use of the most current standard should be used and noted.

3.2.2 Declaration and Header Fields

No errors were reported during the evaluation of the Declaration file and the file header records

4. IGES Analysis

No IGES files were included on the tape.

5. SGML Analysis

The text file parsed without reported error using the Exoterica *XGML Normalizer* parser. The file appeared to have been parsed using the Exoterica parser before being written to the tape.

The text file was parsed using the DataLogics *ParseStation* software and no errors were reported.

6. Raster Analysis

One raster image was included on the tape. The file was checked using the CTN *validg4* and no errors were reported. The file was converted using Rosetta Technologies *Prepare* without error. The resulting file was viewed and printed using Rosetta Technologies *Preview*. The image appeared to be complete and matched the sample file included with the tape. Hard copies of the image are included in the appendix to this report.

The file was converted on the PC using Inset Systems *HiJaak* to a PCX format. The resulting file was viewed on the screen using *Viewer* and Software Publishers *Harvard Graphics 3.0*. The *Harvard Graphics 3.0* image was printed and is included in the appendix to this report.

7. CGM Analysis

No CGM files were included on the tape.

8. Conclusions and Recommendations

In summary, the MIL-STD-1840A tape from Litton Systems Canada Limited was basically correct. The tape could be read properly using the CTN *Tapetool* Software and only one note was generated during this procedure.

The text file was parsed without reported error using Exoterica's *XGML Parser*.

The raster file was reported as being a valid file using the CTN *validg4* software. The image was successfully converted, displayed, and hard copies made using two different software packages.
