ABSTRACT

This report contains a summary of EG&G fireball photography and a preliminary analysis of the results for Shot Tanana of Operation Dominic. Tanana, an LRL-sponsored device, was detonated on 25 May 1962, at GZ-10, southwest of Christmas Island. Measured time of drogue-retarded fall from the B-52 delivery aircraft, flying at an altitude of 25,000 feet, was 50.853 seconds. The device was detonated at an altitude of 9,030 ft ± 50 ft above MSL. The local Christmas Island time of detonation was 0708:50.7922, uncorrected for WWVH propagation time.

Phi scaling indicates a fireball yield of 2.3 kt ± 0.3 kt, and Mach scaling shows a yield of 2.4 kt ± 0.4 kt.

TABLES

[redacted]

1.0 BHANGMETER OPERATION AND DATA

Nine Bhangmeters were employed on Shot Tanana: three at the EG&G Timing Trailer at A Site, two each on the two C-130 aircraft, and two on the B-52 delivery aircraft. All Bhangmeters except the RO-1 No. 3 (40 msec full scale) were set at 80 msec full scale to accommodate the time-to-minimum of the expected yield. Minimum time therefore occurred between the second and third pip on those traces, making the time resolution of the readings poor. The results, however, do not contradict the yield obtained by other methods. Table 1 summarizes Bhangmeter operation and the data obtained.

Table 1. Bhangmeter data.

Location	Type	Reading	
		No. of Pips	Time (msec)
Timing Trailer, A Site	RO-1 No. 1	2.75	5.5
Timing Trailer, A Site	RO-1 No. 2	2.5	5.0
Timing Trailer, A Site	RO-1 No. 3	5.75	5.75
Aircraft 298 (C-130)	MK-V, S/N 1	2.75	5.5
Aircraft 298 (C-130)	MK-V, S/N 2	3.0	6.00
Aircraft 299 (C-130)	MK-V, S/N 3	2.75	5.5
Aircraft 299 (C-130)	MK-VI, S/N 4	2.75	5.5
B-52 Aircraft	ASH 4	2.75	5.5
B-52 Aircraft	MK-VI	3.0	6.0

The average t_{min}, 5.58 msec, corresponds to a yield of 2.2 kt ± 0.3 kt at an ambient air density of 0.891 grams/liter for an altitude of 9,030 feet.

2.0 CAMERA INSTRUMENTATION AND OPERATION

Photographic coverage of fireball growth was provided by land-based camera installations at Sites A, MM, and D on Christmas Island and by airborne installations on two C-130 aircraft. The B-52 drop aircraft was also instrumented to record fireball formation. The exact instrumentation of these stations is detailed in Appendix A, and an evaluation of the operation of each camera is given on the Film Comment Sheet, Table 2. Complete survey data for the actual GZ-10 for Tanana are given in Appendix B.

2.1 Position of Burst

Six theodolite cameras were operated, two at each of the ground stations. All six theodolites operated properly. A photo-triangulation of the position of burst was performed on the basis of records from all three stations. A diagram showing the angular off-axis position of the burst from the A, MM, and D Site stations is presented in Fig. 1. The calculated position of burst was:

N 182590
E 690410 } referenced to H&N Universal Transverse Mercator Grid

Height 9,030 ft ± 50 ft above MSL

The resultant slant ranges from the camera stations are 53,829 feet from MM Site and 53,768 feet from A Site. These figures agree quite well with the Sandia Corporation radar slant-range measurements of 53,760 feet and 53,610 feet, respectively, from the MM and A Site radar positions located adjacent to the camera stations.

2.2 Fireball Photography

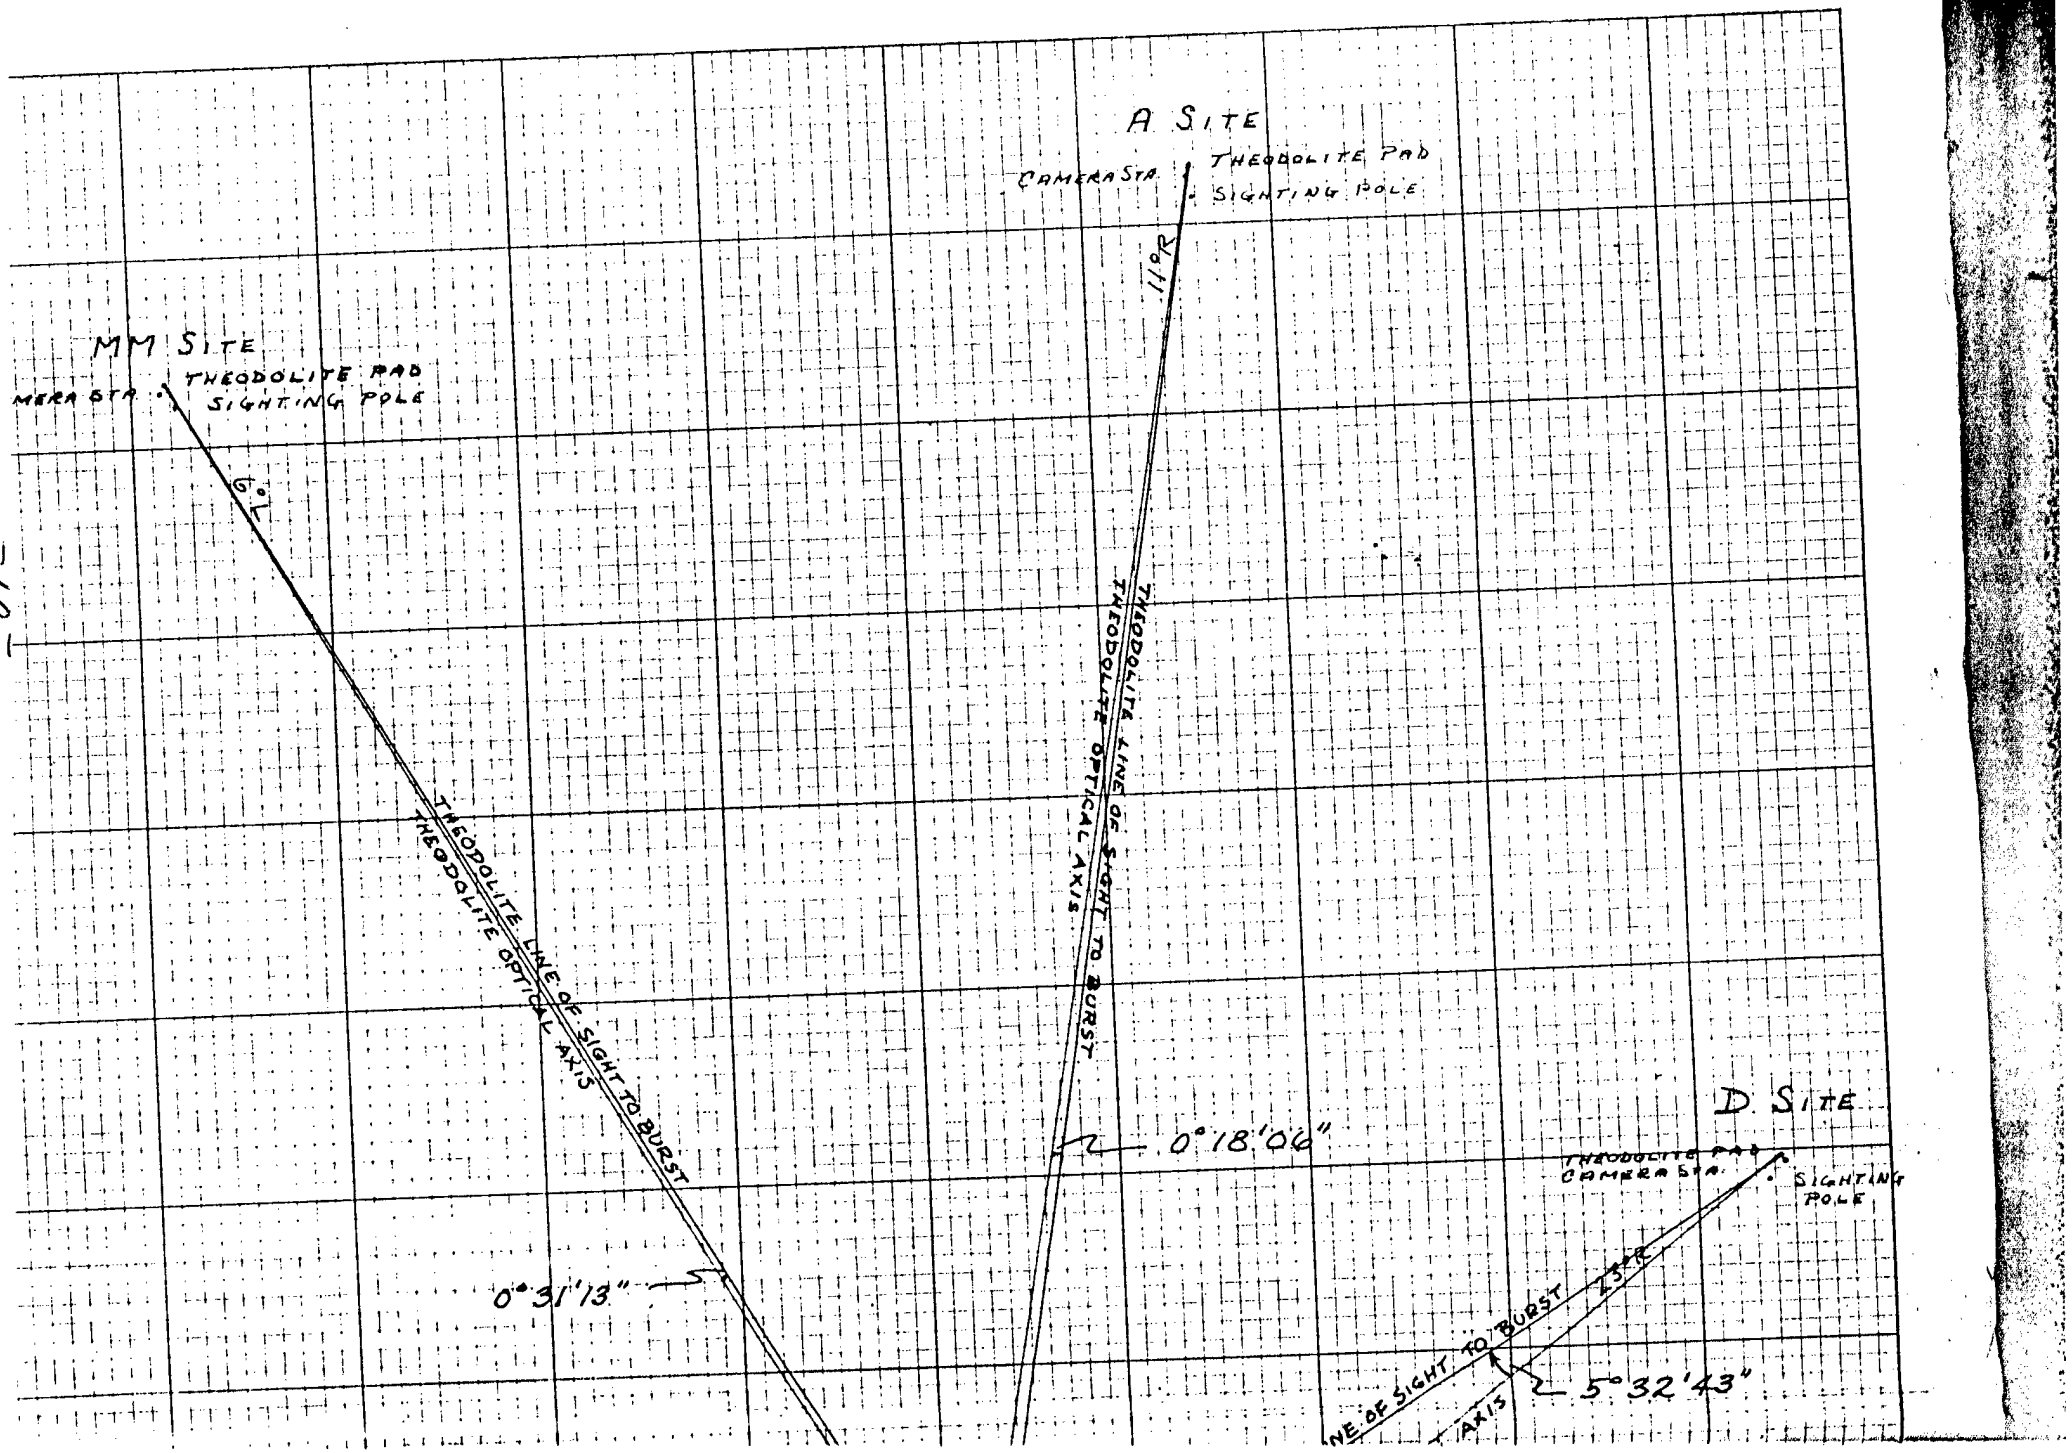
Fireball growth was recorded and measured from all ground stations. All six high-speed Photo-Sonic cameras at these sites obtained usable fireball records.

The cameras in both C-130 aircraft started late, apparently because of failure to receive the ARM BARO signal and subsequent manual operation of the instrumentation system. The cameras at these stations recorded only late fireball pictures. The Photo-Sonic camera in the B-52 obtained a good fireball record, but the Fastax camera in that aircraft did not operate.

AFSWC furnished slant ranges as follows between the aircraft and the device: 31,700 feet ± 820 ft for the B-52 delivery aircraft, 65,094 feet ± 50 ft for Aircraft 299, and 63,031 feet ± 400 feet for Aircraft 298.

The aiming of all ground-based cameras was good. The radar-trained mount at A Site tracked well, the image being about one-half degree low in the frame, but centered horizontally. The MM Site mount was aimed about one degree high and one-half degree to the left of the fireball at zero time. The records from the fixed-mount camera station at D Site show the image to be well-centered vertically and one degree to the right of the frame center.

Good Dynafax records were obtained from D and MM Sites, although on the MM Site record, the image was located at the bottom edge of the frame,



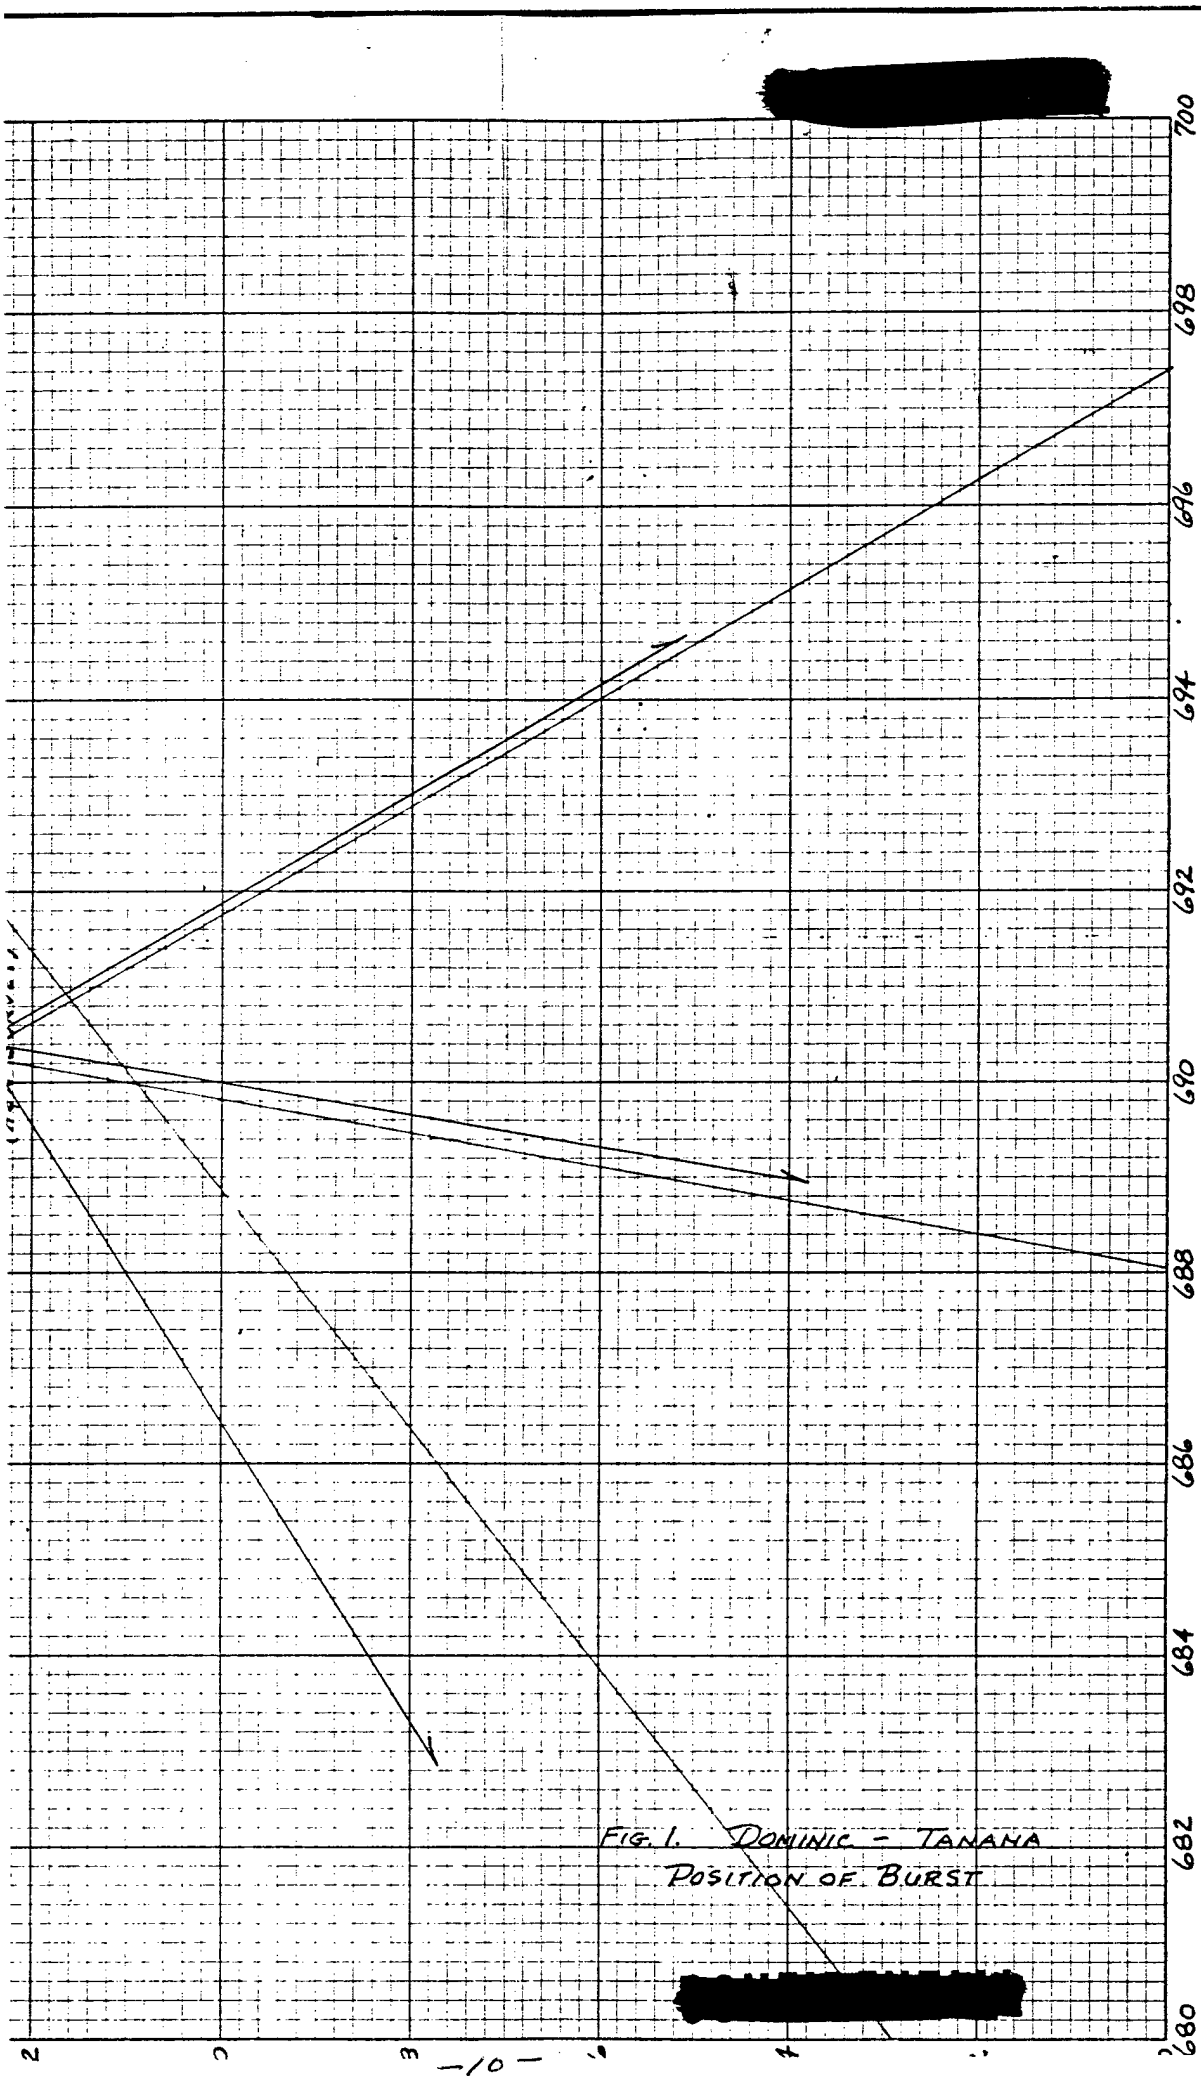


FIG. 1. DOMINIC - TANANA
POSITION OF BURST

[redacted]

causing slight distortion as it grew toward the edge of the frame. The Dynafax at A Site did not record an image because it was aimed slightly higher than the other cameras on the mount and it could not encompass the fireball in its narrow field of view.

All twelve Rapatronics obtained fireball records, although heavy exposure on most films caused the data obtained to be somewhat less precise than usual. Measurements are included in Appendix D, and the results are plotted on D and MM Site Dynafax diameter-time curves. These curves were used to obtain the zero-frame times of exposure on the high-speed camera records.

3.0 YIELD DETERMINATION

The photographic plan was designed to record an expected 100-kt device with a brightness of 3×10^4 watts/meter^2 at minimum time, and the actual brightnesses experienced were about 10^6 watts/meter^2. For this reason the films were heavily exposed and, because of the small images, were in some cases quite difficult to analyze.

The yield as determined by a variable-phi scaling technique is 2.3 kt ± 0.3 kt. The Mach scaling method indicates a yield of 2.4 kt ± 0.4 kt. The yield figures are based on an extensive analysis of the four best high-speed Photo-Sonic records from the ground stations.

Because of the low yield of the Tanana device, ϕ^5 scaling techniques were not used. Mass effects and other factors prevented the diameter-time history from attaining the constant-growth region, indicated by a region of constant ϕ, which ϕ^5 scaling requires. For fireballs of variable growth rates it has been found that, although variable, the growth rates of devices

[redacted]

[redacted]

with ϕ-time curves of similar shape are comparable; thus the diameter-time histories lend themselves to scaling.

The yield of a device can therefore be determined by comparing its diameter-time behavior to that of a device of known yield according to the formula:

$$\frac{\omega_1}{\omega_2} = \frac{\rho_{o_1}\, \phi_1^5}{\rho_{o_2}\, \phi_2^5}$$

where ω = yield (kt)

ρ_o = ambient air density (grams/liter)

ϕ = D (meters)/$t^{2/5}$ (msec)

The diameter-time history of Tanana was scaled using this method, and comparisons were made with four shots from previous operations: Teapot-Moth, Teapot-Wasp, Ranger A, and Tumbler-Snapper 1. Detailed tabulations of the comparison of Tanana to each shot, together with the resultant yield figures, are presented in Tables 3 through 6. Table 7 summarizes the results from this method of analysis.

The Tanana ϕ-vs-time curve used in these calculations is presented in Fig. 2.

The Mach scaling method was also applied to the combined diameter-time data from the four best Photo-Sonic 4B records (Table 8). In this method of yield determination, a polynomial fit is made on all the data; and the resultant diameter-time curve, which represents the characteristic diameter-time behavior for this shot, is scaled to a theoretical 1-kt diameter-time curve. The coefficients of the polynomial to which the diameter-time data

[redacted]

[redacted]

were fitted by least squares are given below each tabulation, along with ambient pressure (mb), temperature (^{o}K), ambient sound velocity (m/msec), and the time interval over which the fit was made.

In an effort to eliminate the scatter which is especially apparent at early times, the Mach scaling method was also applied to the data derived from a smooth curve visually fitted to the composite plot of diameter vs time from all stations. The smoothed diameter-time curve is presented in Fig. 4, the data which were taken from it are shown in Table 9, and the Mach scaling results are contained in Table 10. The yield by Mach scaling is taken to be the average of these results and the results of the calculations made on the composite data from the four best films. The limits include 80 percent of the scatter apparent in both calculations.

Complete ϕ^{5} yield calculations for each film, valuable chiefly for their tabulation of diameter, time, and phi, are given on the IBM printout sheets contained in Appendix C.

Plots of diameter vs time and phi vs time for the data from each station are shown in Figs. 5 through 13. Composite plots for the complete sets of data are given in Figs. 14 and 15. Diameter measurements and camera data calculation sheets for each film are included in Appendix D.

An air density of 0.891 grams per liter was calculated for an altitude of 9,030 feet above MSL, based on an H+15 minute observation by JTF-8 Weather Central, which reported a pressure of 737 mb, a temperature of 15.0^{o}C, and a relative humidity of 39% at that altitude.

Examples of fireball photography are included in Appendix E.

$\cos\alpha$ = 1.00000	$\cos\beta$ = 0.96439	H_C = 4.57 m.
CB_h = 10,019.28 m.	$\sin\beta$ = 0.26448	ΔH = 2,740.6 m. *
$CB_h \cos\alpha \cos\beta$ = 9,662.49	$\Delta H \sin\beta$ = 724.83	$R^{o}/_{A}$ = 10,384.9 m.

B. FOCAL LENGTH 76.25 mm.

* THIS FIGURE REPRESENTS APPARENT ΔH AS SEEN FROM D SITE, UNCORRECTED FOR CURVATURE & REFRACTION.

C. MAGNIFICATION FACTOR (meters/in.)

48.735 ~ 70.983 m/in.

D. ZERO TIME CORRECTION + 0.023 msec.

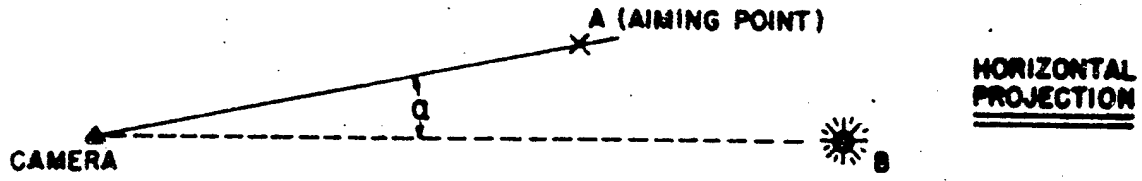
CAMERA DATA & CALCULATIONS

FILM NO. 106250	STATION NO. B-52	TEST TANANA	CALCULATED BY: R.
CAMERA NO. PS 4B-8	EQ. AP.		DATE: 6-2-62



A. $R'_A = CB_h \cos\alpha \cos\beta + (H_B - H_C) \sin\beta$

α = 1°12'30"	β = 1°4'30"	H_B = 9030'
$\cos\alpha$ = 0.99978	$\cos\beta$ = 0.99982	H_C =
CB_h =	$\sin\beta$ =	ΔH =
$CB_h \cos\alpha \cos\beta$ =	$\Delta H \sin\beta$ =	R'_A = 31687'

B. FOCAL LENGTH 108.30 mm

DME - SLANT RANGE = 31700 ± 820 FEET

C. MAGNIFICATION FACTOR (meters/in.)

48.41 ~ 46.79.

D. ZERO TIME CORRECTION ± 0.10 msec.
