ONR FINAL TECHNICAL REPORT

Title: Numerical Studies of Rough Surface Scattering Models

Grant No.: N00014-89-J-1989

PI: Shira L. Broschat

I. Summary

The focus of this research has been the development of analytic surface scattering models that accurately predict acoustic wave scattering from sea surfaces and from the ocean bottom. A number of surface scattering models have been developed and examined. For the phase perturbation approximation we obtained scattering strength results for 2-D pressure-release surfaces with a Gaussian spectrum and for 1-D pressure-release surfaces with a Pierson-Moskowitz spectrum. Results were also obtained for the coherent reflection loss. For the small slope approximation we derived the expressions for the coherent reflection coefficient and for the first three terms of the incoherent bistatic scattering cross section. In addition, we thoroughly examined and explained small slope theory. Numerical results for the scattering strength were obtained for both 1-D and 2-D pressure-release surfaces using a Gaussian spectrum or a Pierson-Moskowitz spectrum, and results were obtained for the coherent reflection loss. Fluid-solid and fluid-fluid interface problems were also studied. Expressions for the cross section were derived, and numerical results for the scattering strength were obtained for 1-D surfaces for the lowest-order small slope approximation using both Gaussian and modified power-law spectra. The local parabolic approximation was developed, and numerical results for the scattering strength were presented for pressure-release surfaces. Our most recent work has focused on the nonlocal small slope approximation which was developed, in part, as a result of our study of the small slope approximation. While the majority of the research accomplished under this grant concerned the study of analytic models, a numerical model was developed as well. This numerical model was based on the Finite-Difference Time-Domain (FDTD) method, and it was developed for two purposes: To benchmark approximate analytic models and for use in conjunction with another ONR-sponsored project to study acoustic propagation in a shallow-water environment.

Dear Sir or Madam:

Enclosed is the submittal of the final technical report for Dr. Shira Broschat, School of Electrical Engineering and Computer Science, Washington State University, Grant No. N00014-89-J-1989. Also, attached to the report is the completed SF 298.

Please notify the appropriate people that this report and the SF 298 has been received.

If you need further information, please call me at (509) 335-9661 or email me at nshrope@wsu.edu.

Sincerely,

A handwritten signature in cursive script that reads "Nancy Shrope".
