Abstract

When Army special operations forces (SOF) operate in conjunction with or close to conventional Army forces, a special operations command and control element (SOCCE) is established to synchronize operations and harmonize actions between the SOF and conventional force elements. A SOCCE is usually co-located with an Army corps tactical operations center (TOC). On the emerging digitized battlefield, the corps TOC will be equipped with the Army Tactical Command and Control System (ATCCS) to provide a seamless flow of tactical information to commanders, corps, and below. A SOCCE will also require an ATCCS capability in order to exchange information with the conventional force and successfully perform its mission. A preliminary mission and task analysis was conducted to assist in identifying initial equipment and personnel requirements for a digitized SOCCE employing ATCCS. The outcome of the analysis indicates that if assumptions regarding SOF message format compatibility with ATCCS software are met, the SOCCE will be able to operate with two maneuver control systems (MCS), which is the integration component of ATCCS. The analysis also indicates that, in addition to the existing operations center, the SOCCE will require a signal center to link the operations center with other headquarters within the electronic battlefield command and control architecture. Personnel augmentation will be necessary to fully staff the SOCCE operations center S2 (intelligence) and S3 (operations) functions for 24-hour operations. Recommendations are that the equipment and personnel requirements identified by this analysis be verified during field training exercises and by simulation and modeling, a van or vehicular mounted shelter configuration be considered to house a SOCCE, and documentation be initiated to establish requirements for a system acquisition program.

ACKNOWLEDGMENTS

CPT John Downey and SFC Donny Lynch, U.S. Army Special Operations Command (USASOC), spent numerous laborious hours with the authors conducting the task analysis leading to the findings of this report. Dave Durbin and Kate Dettmann, U.S. Army Research Laboratory (ARL), George Person and James Reale, USASOC, provided insightful reviews of the report. Nancy Nicholas (ARL) technically edited and enhanced the quality of the manuscript to meet publication standards.

SPECIAL OPERATIONS COMMAND AND CONTROL ELEMENT (SOCCE)
PRELIMINARY ANALYSIS OF EQUIPMENT AND PERSONNEL
REQUIREMENTS FOR THE DIGITIZED BATTLEFIELD

BACKGROUND

When Army special operations forces (SOF) operate in conjunction with or close to conventional Army forces, a special operations command and control element (SOCCE) is established to synchronize operations and harmonize actions between the SOF and conventional force elements. Most commonly, a SOCCE is established to support an Army corps and is co-located with the corps tactical operations center (TOC). On the emerging digitized battlefield, Corps TOCs will be equipped with the Army Tactical Command and Control System (ATCCS) to electronically provide a seamless flow of battlefield information to tactical commanders, corps, and below. To provide timely and effective coordination of operations between SOF and conventional forces, a SOCCE requires command, control, and communications systems and digital message formats that are compatible with ATCCS. This is currently not the case. In response to this need, the U.S. Army Special Operations Command (USASOC) has initiated a cooperative effort with the Training and Doctrine Command (TRADOC) and acquisition program managers to work toward SOF compatibility with ATCCS. In conjunction with this effort, USASOC requested the Human Research and Engineering Directorate of the U.S. Army Research Laboratory (ARL) to assist in identifying the equipment and personnel requirements for a SOCCE employed on the digitized battlefield.

PURPOSE

This report describes a preliminary mission and task analysis conducted to assist in identifying equipment and personnel requirements for a SOCCE using ATCCS on the digitized battlefield. The outcome of the analysis is discussed and recommendations are provided. The outcome of the analysis will provide initial data to support the development of concept of operations and operational requirements document (ORD) for a digitized SOCCE.

SPECIAL OPERATIONS COMMAND AND CONTROL ELEMENT (SOCCE)

A SOCCE is a command and control element that operates in a manner similar to a TOC (U.S. Army JFK Special Warfare Center and School, 1994). A SOCCE does not perform mission planning for SOF operational elements, nor does it launch or recover operational elements. These are functions performed by either a forward operational base (FOB) or a special forces operational

base (SFOB), depending on the tactical situation. A SOCCE does, however, coordinate these special forces operational base activities as part of its mission to synchronize and harmonize operations between SOF and conventional forces. SOCCE functions include

1. Keeping higher SOF commander and conventional force commander informed of each other's current and future operations, intelligence data, fire support coordination measures, unit locations, communications procedures, and situation status;
2. Planning and coordinating linkup between SOF and the conventional force;
3. Exercising operational control or tactical control of deployed SOF, when tasked by higher headquarters; and
4. Advising the conventional force commander and staff of the mission capabilities, limitations, and employment of SOF.

When a decision is made to establish a SOCCE, a special forces Operational Detachment B (ODB) is tasked to organize and operate the SOCCE. The ODB consists of the personnel shown in Table 1.

Table 1
Operational Detachment B (ODB)

	Grade	MOS ^a
Commander	O4	18A00
Executive officer	O3	18A00
Warrant officer	W4	180AO
Detachment NCO ^b	E9	18Z50
Operations NCO	E8	18Z50
Communications NCO	E7	18E40
Assistant operations NCO	E6	18B30
Medical NCO	E6	18D3D
Communications NCO	E6	18E30
Supply sergeant	E6	92Y3S

^aMOS = military occupational specialty

^bNCO = noncommissioned officer

When tasked to operate a SOCCE, the ODB may be augmented with an enhanced communications capability.

ARMY TACTICAL COMMAND AND CONTROL SYSTEM (ATCCS)

As mentioned previously, ATCCS will provide a seamless flow of information to Army tactical commanders on the digitized battlefield (U.S. Army TRADOC Program Integration Office, Army Battle Command System, 1 July 1996). Common hardware is used to share data pertaining to plans, troop movements, re-supply points, and other battlefield information. ATCCS is comprised of six battlefield automated system products:

1. All-Source Analysis System (ASAS) - The intelligence and electronic warfare (IEW) component used to plan and analyze intelligence operations and to process intelligence messages and reports.
2. Forward Area Air Defense Command, Control Communications, and Intelligence (FAADC3I) - Integrates air defense, fire units, sensors, and C2 centers to defeat low altitude air threats.
3. Combat Service Support Control System (CSSCS) - The logistics component.
4. Advanced Field Artillery Tactical Data System (AFATDS) - The fire support component, which coordinates fire support and processes call for fire messages.
5. Maneuver Control System (MCS) - The integration component of ATCCS, which provides a mapping capability and the common battlefield picture depicting friendly and threat locations and situational awareness to commanders. Provides a message-handling capability as well as commercial office tools software.
6. Force XXI Battle Command Brigade and Below (FBCB2) - Distributes information from above Corps level down to the platform and provides feedback up the chain of command.

An issue for SOF is that in the current stage of development, message formats for one ATCCS product may not be compatible with another. Among the messages that deployed SOF commonly sends are intelligence spot reports, calls for fire, and situation reports. The result is that a SOCCE could conceivably need an ASAS, AFATDS, and MCS to receive and pass SOF messages to the Corps. The typical SOCCE has neither the physical space nor personnel to support all three systems.

USASOC intends to develop software that will allow deployed SOF to send digital messages in a format that is compatible with MCS. Also, the Army is initiating efforts toward compatibility of message formats among all ATCCS products. This will permit a SOCCE to receive and forward digitized messages with only one type system, the MCS.

ANALYSIS

In order to identify the equipment and personnel needed to operate a SOCCE on the digitized battlefield, a mission and task analysis was conducted using the process represented in Figure 1 and described in the following paragraphs.

Figure 1. Analytical process.

Specifically, the analysis addressed the following issues for a digitized SOCCE:

1. How many MCS are required?
2. Is ASAS required for intelligence tasks?
3. What type of command, control, communications, and computers are required?
4. What ancillary equipment is required?
5. What is the MOS and quantity of personnel required?

To answer these questions, the SOCCE was divided into two sections: An operations center staffed by the ODB, which is responsible for performing the SOCCE mission, and a signal center responsible for providing the communications link for SOCCE. A list of tasks performed

within each of the sections was developed for the analysis. Three special forces subject matter experts (SMEs) (one captain, 18A00; one CW4, 18OAO; and one sergeant first class, 18E) participated in the analysis. The analysis was accomplished by answering the following questions for each task:

1. What is the purpose of the task?
2. How is the task accomplished (process, equipment)?
3. If information is passed, to whom and how is it passed?
4. How often is the task performed?
5. How much time is required to perform the task?
6. Who accomplishes the task?
7. Is the MOS appropriate?
8. Is the number of assigned personnel adequate?

Assumptions

The following assumptions were made in order to conduct the analysis:

1. The SOCCE is co-located with an Army corps TOC equipped with ATCCS.
2. SOCCE operates 24 hours per day and employs two 12-hour shifts.
3. All messages arriving at a SOCCE from deployed SOF can be reviewed and then, if required, can be passed to the corps via the MCS.
4. The deployed SOF supported by the SOCCE consists of six special forces Operational Detachments A (ODA).
5. The FOB or SFOB launches the six ODAs. The ODAs conduct a special reconnaissance mission and are re-tasked to conduct an ensuing direct action mission. SOCCE coordinates ODA linkups with conventional forces and at the completion of the mission, coordinates ODA exfiltration.

Operations Center Analysis

Operations Center Tasks

The list of tasks for the operations center was derived from the draft SOCCE handbook and a set of SOCCE critical tasks provided by the JFK Special Warfare Center and School. The list includes tasks performed during mission planning before deployment, during deployment, and during operation of the SOCCE. The analysis encompassed the complete list of tasks. The focus and emphasis of the analysis and this report, however, are the tasks performed by the SOCCE once it is established and operating with the corps TOC.

The matrix in Appendix A was developed to assist in the process of assigning equipment and staff positions to each task. Blocks with an “X” indicate the corresponding equipment or staff position assigned each task. Some tasks are performed using multiple items of equipment or by multiple staff positions. Certain tasks do not require the use of any equipment and are performed by thought processes, face-to-face conversations, or other means.

Operations Center Equipment

The SOCCE equipment requirements were identified by addressing the questions in the analytical process described earlier. The outcome of the analysis indicates that the SOCCE operations center will require the following types of equipment to perform its mission on the digitized battlefield:

1. Office automation hardware and software, for example, a laptop computer with standard commercial software.
2. Mission planning hardware and software.
3. MCS—message handling, tactical situation awareness map with threat and friendly force information, Microsoft (MS) Office® software.
4. E-mail capability
5. Secure wide area network (WAN)—wire link between SOCCE and other elements on the digitized battlefield.
6. Secure local area network (LAN)—wire link inside SOCCE.
7. SOCCE communications—radio links.

8. Projection TV
9. Copy machine
10. Facsimile machine
11. Printer
12. Telephones—including secure line capability.

As mentioned earlier, one of the issues addressed by the analysis is whether ASAS is required to accomplish intelligence tasks. The analysis indicates that an ASAS is not required in the SOCCE operations center. ASAS is used to conduct intelligence analysis and planning at the FOB or SFOB or supported conventional force intelligence assets. A SOCCE does not plan operations to the extent that would justify a need for ASAS. The level of intelligence information needed at a SOCCE is primarily battlefield situational awareness, including the status and location of friendly and enemy forces. This information can be obtained using MCS. Again, the mission of a SOCCE is only to provide command and control to deployed elements and to synchronize and coordinate SOF operations.

An MCS capability is required for a SOCCE to synchronize and coordinate SOF and conventional force operations on the digitized battlefield. The analysis identified 32 tasks requiring the use of MCS, once a SOCCE is established and operating with the corps TOC (see Appendix A, page 29, Operate SOCCE). In order to determine the number of MCS required, the frequency of tasks and the time to perform MCS tasks were assessed. Of the 32 tasks, 27 are recurring and are performed on a daily basis. The five remaining tasks are non-recurring and are accomplished only during particular phases of the mission. The five non-recurring tasks are (a) coordinate exfiltration operations, (b) issue fragmentary orders, (c) plan and coordinate link operations, (d) prepare a synchronization matrix, and (e) coordinate maps.

The three special forces SMEs categorized tasks by staff position and then estimated the time required to perform each MCS task. The time each staff position performs daily, recurring MCS tasks during a 12-hour shift, is shown in Table 2. For example, during a typical 12-hour shift, the S2 spends 8.5 hours on tasks using MCS.

The estimated time to complete each non-recurring task is shown in Table 3. For example, the time to perform the task of planning and coordinating one linkup operation is 6 hours. With six ODAs deployed, it is conceivable that over the course of the SOCCE mission,

six separate linkup operations could be coordinated. It is important to note, though, that non-recurring tasks are not normally accomplished within the confines of one 12-hour shift. As shown in Table 3, the S3 is the primary staff element responsible for performing the non-recurring tasks.

Table 2

SOCCE Daily Recurring MCS Tasks

Position	Hours per 12-hour shift
Commander	1
XO/shift leader	1.5
S1	2.5
S2	8.5
S3	3.5
S4	<u>0.1</u>
Total	17.1

Table 3

Mission-Dependent Non-Recurring MCS Tasks

Position and task	Hours per one event
S3: Coordinate exfiltration	3
S3 and CMDR: Issue fragmentary orders	2
S3: Plan and coordinate linkup	6
S3: Prepare synchronization matrix	1
S2 and S3: Coordinate maps, charts, imagery	<u>0.2</u>
Total	12.2

As indicated in Tables 2 and 3, the time spent by the S2 and S3 in performing MCS tasks justifies each having an MCS. Other staff positions occasionally use MCS. These positions could share the S2 and S3 systems when needed while relying primarily on laptop computers to conduct most of their tasks.

Operations Center Personnel

As mentioned earlier, a SOCCE is staffed by the ODB. In order to identify who performs each task, it was useful to categorize staff positions by function as well as MOS. Tasks were assigned to the following staff positions or functions, as appropriate:

Command Group—Commander and Executive Officer

Shift Leaders—Executive Officer and Warrant officer

Sergeant Major—Detachment NCO

S1—Medical NCO

S2—Operations NCO

S3—Operations NCO and Assistant Operations NCO

S4—Supply Sergeant

Communications—Senior Communications NCO and Junior Communications NCO.

The analysis indicates that the ODB does not have sufficient personnel with the necessary qualifications to staff the S2 and S3 functions for 24-hour SOCCE operations. The S3 function can be performed by either the Operations NCO or the assistant Operations NCO. The S2 function requires someone who has completed operations and intelligence training that is currently obtained by attending the Advanced Noncommissioned Officers' Course. Referring to Table 1, only the detachment NCO and the Operations NCO are qualified to perform S2 functions. The detachment NCO normally is not available to perform dedicated S2 or S3 functions because of other responsibilities. The Operations NCO is qualified to perform both S3 and S2 functions. However, in view of the workload associated with these staff positions as indicated in Tables 2 and 3, time may not always permit the Operations NCO to perform both functions. Therefore, additional personnel qualified to perform either the S2 or S3 functions are required in order to provide adequate staffing for 24-hour operations. For example, if we assume that the Operations NCO and the assistant Operations NCO split the S3 responsibility for each 12-hour shift, then the ODB will require augmentation of two additional personnel to fulfill the S2 responsibility for each shift. Personnel augmentation is not a new issue resulting from digitizing the SOCCE. Currently, when non-digitized SOCCEs are established, the ODB is usually assigned personnel on a temporary basis to assist in operating a SOCCE. Some units augment the ODB with personnel from the Military Intelligence Detachment to fulfill the S2 function.

ODB appears to have sufficient personnel to fill the other SOCCE staff positions for 24-hour operations.

Signal Center Analysis

Signal Center Tasks

The tasks performed in the signal center were developed by analyzing the mission command, control, and communications requirements. This analysis began with defining the type of information flowing in and out of a SOCCE and identifying the communication nets needed to provide this information flow on the digitized battlefield.

It was determined that the communication nets and peripheral equipment needed for a SOCCE are similar to those in the joint base station (JBS) recently developed for SOF. JBS is a communications shelter designed to serve as a signal center for FOBs and SFOB (Malkin, Allender, Kelley, O'Brien, & Graybill, 1997). The list of tasks used in the development of JBS was adapted and tailored for use in the SOCCE analysis. SOCCE signal center tasks and the MOSs of the personnel identified to perform those tasks are listed in Appendix B.

Signal Center Equipment

When an ODB is tasked to establish a SOCCE, it is supported with communications systems and personnel to operate the systems. A SOCCE normally shares information and maintains communications links with deployed SOF, FOBs, or SFOB, the joint task force, and conventional forces. To link with these headquarters on the digitized battlefield, the following communications and computer nets are needed.

1. To net with deployed operational elements, the SOCCE will need the following communications systems.
 - a. Two high frequency (HF) nets (secure voice, data, International Morse Code)
 - b. Two ultra high frequency (UHF) nets (one voice, one data)
 - c. One very high frequency-frequency modulated (VHF-FM) net (single channel ground and airborne radio system [SINCGARS])
 - d. Lightweight video reconnaissance system (LVRS) base station (could be located either in the signal center or the operations center)
 - e. One HF low probability of interception/low probability of detection (LPI/LPD) net

2. The special operations communications assemblage (SOCA) is currently provided to a SOCCE for communications with the FOB or SFOB. The improved SOCA will be fielded soon and consists of (a) one HF radio net, and (b) one UHF radio net.

3. The following connectivity is required for a SOCCE to digitally link with the Army corps TOC and other headquarters within the seamless electronic command and control architecture:

- a. Automation system - joint base station type capability (communication gateway system [CGS] 100, automated message system [AMS], matrix switch)
- b. LAN
- c. WAN (access provided by corps TOC)
- d. Router—route messages by IP address.
- e. Four wires—secure telephone, multiple subscriber equipment (MSE)

Signal Center Personnel

Operators, identified by MOS, were assigned to perform each of the signal center tasks as shown in Appendix B. SOf has previously identified three radio operator-maintainer 31Cs to operate the SOCA kit on a 24-hour basis. In addition to the 31Cs who operate the SOCA kit, one 31C and one 18E per 12-hour shift will be needed to operate the other SOCCE communications systems. One information system operator-analyst, 74B, per 12-hour shift will be needed to perform the automation and network management tasks. Therefore, two 18Es, two 31Cs, and two 74Bs are needed for 24-hour operations employing two 12-hour shifts, not including the SOCA kit operators. This number of personnel will require supervision. One solution would be for the ODB communication NCOs to provide staff supervision for the signal center.

A SOCCE signal center of the size and with the equipment proposed in this analysis does not currently exist. Except for the three 31Cs for the SOCA, there is no organization in place to provide the personnel needed to operate this proposed signal center. 18E, 31C, and 74B personnel are assigned to special forces group headquarters signal detachments. These personnel are identified to operate the JBS. However, as a result of funding shortages, the JBS will not be fielded at the group headquarters level. If a decision is made to develop and field a digitized SOCCE system, group headquarters personnel may be available to staff the SOCCE signal center.

SUMMARY AND CONCLUSIONS

Army corps TOCs soon will be equipped with ATCCS. SOCCEs that coordinate battlefield information with Army corps require ATCCS-compatible hardware and software. A preliminary analysis was conducted to identify initial equipment and personnel requirements for a future SOCCE using ATCCS on the digitized battlefield.

The outcome of the analysis indicates that if assumptions regarding SOF message format compatibility with ATCCS software are met, the SOCCE can operate with two MCS systems and an ASAS will not be needed. The MCS systems will be used primarily to support S2 and S3 coordination functions. Using MCS to perform these functions will provide timely and effective synchronization of SOF and conventional force operations with the goal of harmonizing actions and avoiding fratricide. ASAS is not needed because a SOCCE does not normally conduct a level of tactical mission planning and intelligence analysis that requires a capability beyond that provided by the MCS.

As with current, non-digitized SOCCEs, the ODB will have to be augmented with additional personnel when tasked to operate the digitized SOCCE to staff both the S2 and S3 functions for 24-hour operations.

In order for a SOCCE to link with other headquarters in the command and control architecture of the electronic battlefield, a signal center similar to that of JBS will be required. Staffing for the signal center needs to be resolved. It is suggested that individuals with the appropriate MOS, who are currently assigned to SF group headquarters, be employed to operate the signal center.

RECOMMENDATIONS

Recommend that the preliminary requirements for equipment and personnel identified in this analysis be validated during SOCCE field training exercises using MCS and through simulation and modeling. During training exercises, data should be collected about how frequently tasks are performed, the time to perform tasks, the quantity and MOSs of personnel who perform the tasks, and the workload associated with each task. These data could then be placed in a model such as the improved performance research integration tool (IMPRINT) designed to assess levels of soldier and system performance. The model can assist in verifying the appropriateness of assigned personnel and predicting workload associated with operating or maintaining SOCCE equipment.

An analysis of how the equipment should be packaged must be completed. The Army is developing a command and control vehicle for use by the corps TOC. As a result, the corps will be highly mobile. The SOCCE will need to be equally mobile. Recommend that vehicular options such as vans or vehicular mounted shelters be investigated for effective packaging and configuration of the SOCCE operations and signal centers.

An ORD for a digitized SOCCE system needs to be developed as soon as practical. If SOF and conventional forces are to support each other on the future electronic battlefield, then SOCCE technology must keep pace and be compatible with that of the conventional Army corps TOC.

****Acronym List**

BN	battalion
CCIR	commander's critical intelligence requirements
CMDR	commander
COIN	counter insurgency
COMMSTAT	communications status
CP	command post
CS	combat support
CSS	combat service support
Exfil	exfiltration
FRAGO	fragmentary order
GP	group
GPF	general purpose force
HQ	headquarters
IAW	in accordance with
ICW	in coordination with
Infil	infiltration
Intel	Intelligence
IPB	intelligence preparation of the battlefield
IR	intelligence requirements
JSOA	Joint Special Operations Area
LAN	local area network
LNO	liaison officer
LOGSTAT	logistics status
OPLAN	operation order
OPSEC	operations security
PERSTAT	personnel status
PIR	priority intelligence requirements
POV	privately owned vehicle
SITREP	situation report
SOC	Special Operations Command
SOCOORD	Special Operations Coordination Element
TASOSC	Theater Army Special Operations support Command
WAN	wide area network

APPENDIX B
SOCCE SIGNAL CENTER TASKS AND PERSONNEL

SOCCE SIGNAL CENTER TASKS AND PERSONNEL

Function	Task	MOS(s)
Setup Tasks		
Shelter Setup	Position shelter on site	18E
	Set up/install ISOCA radios	ISOCA Tm
	Ground system	18E
	Connect power cables	31C
	Set up tent extension	18E, 31C, & 74B
	Set up camouflage nets	18E, 74C, & 74B
	Run pre-op checks on ECU and generator	31C
	Power up generator	31C
	Power up ECU	31C
	Remote terminal equipment into tent	74B
	Perform shelter power-up procedures	31C
General System Setup	Remote & power up RCCs	74B
	Erect HF antenna #1 (ISOCA)	ISOCA Tm
	Erect HF antenna #2	18E & 31C
	Erect HF antenna #3	18E & 31C
	Erect HF LPI/D antenna	18E & 31C
	Erect UHF TACSAT antenna #1 (ISOCA)	ISOCA Tm
	Erect UHF TACSAT antenna #2	18E & 31C
	Erect UHF TACSAT antenna #3	18E & 31C
	Erect VHF/FM antenna	18E & 31C
	Install SOCCE LAN	74B
	Set up/install MCS workstations	74B
	Perform built-in tests	18E, 31C & 74B
	Perform op checks	18E, 31C & 74B
	Setup/install LAN & wire interfaces with supported unit	74B & 31C

Function	Task	MOS(s)
Programming Tasks		
Configure CGS 100	Perform station setup	74B
	Create a configuration set	74B
	Select routing methods & devices	74B
	Create RI routing tables	74B
	Create PLA/RI database	74B
	Setup networking	74B
	Create user accounts	74B
Configure Matrix Switch	Select input/output connections	74B
Program COMSEC Equipment	Load keying material	18E
	Select mode of operation	18E
Configure Audio Monitoring System	Select audio or data mode of operation	18E
	Program RCCs	18E
	Enable/disable RCC functions	18E
	Configure RCC data port	18E
Program Radio Parameters	Program HF radios	31C
	Program UHF TACSAT radios	31C
	Program VHF/FM radio	31C
	Program HF LPI/D radio	31C
Program Data Controllers	Configure input/output ports	74B
	Set configuration parameters	74B
Program Ethernet router	Configure input/output ports	74B
	Program TCP/IP protocols	74B
Program MCS workstations	Tasks TBD	74B

Function	Task	MOS(s)
Operations		
Checks & Services	Perform PMCS shelter	18E
	Perform PMCS ECU and generator	31C
	Perform PMCS on communications equipment	18E & 31C
	Perform PMCS on automation equipment	74B
Radio Communications	Monitor power	31C
	Listen for incoming voice	31C
	Respond to incoming voice	31C
	Route incoming voice traffic	31C
	Initiate voice call	31C
	Listen for incoming IMC traffic	31C
	Recognize incoming IMC traffic	31C
	Copy incoming IMC traffic	18E
	Respond to incoming IMC traffic	18E
	Troubleshoot radio communications	18E
Digital Message Processing	Monitor incoming message traffic	74B
	Respond to incoming message errors	74B
	Print incoming message traffic	74B
	Deliver incoming message traffic	18E
	Archive incoming message traffic	74B
	Log outgoing messages	74B
	Prepare/load outgoing messages	18E & 74B
	Troubleshoot digital message processing	74B
Automation & Network Management	Back up system logs and files	74B
	Add new hosts/addresses	74B
	Establish user privileges	74B
	Change user privileges	74B
	Troubleshoot automation & networking	74B

Function	Task	MOS(s)
Tear Down		
General System Tear-down	Zeroize COMSEC equipment	18E
	Print logs and archive files, as required	74B
	Power down subsystems	18E, 31C, & 74B
	Power down ECU & generator	31C
	Disconnect antenna & power cables	18E
	Remove ISOCA radios	ISOCA Tm
	Disassemble antennas & stow	18E & 31C
	Disconnect & package RCCs	74B
Shelter System Teardown	Disconnect & stow terminal and MCS equipment	74B
	Dismantle & stow camouflage nets	18E & 31C
	Dismantle & stow tent extension	18E, 31C & 74B
	Disconnect & stow power cables	31C
	Remove & stow grounding equipment	18E

CGS	communications gateway system
COMSEC	communications security
ECU	environmental control unit
HF	high frequency
IMC	international morse code
ISOCA	improved special operations communications assemblage
LAN	local area network
LPI/D	low probability of interception/deception
MCS	maneuver control system
PLA/RI	plain language address/routing indicators
PMCS	preventive maintenance checks and services
RCC	remote control console
TACSAT	tactical satellite
TCP/IP	transport control protocol/internet protocol
UHF	ultra high frequency
VHF/FM	very high frequency/frequency modulation

APPENDIX C

13. ABSTRACT (Maximum 200 words) When Army special operations forces (SOF) operate in conjunction with or close to conventional Army forces, a special operations command and control element (SOCCE) is established to synchronize operations and harmonize actions between the SOF and conventional force elements. A SOCCE is usually co-located with an Army corps tactical operations center (TOC). On the emerging digitized battlefield, the corps TOC will be equipped with the Army Tactical Command and Control System (ATCCS) to provide a seamless flow of tactical information to commanders, corps, and below. A SOCCE will also require an ATCCS capability in order to exchange information with the conventional force and successfully perform its mission. A preliminary mission and task analysis was conducted to assist in identifying initial equipment and personnel requirements for a digitized SOCCE employing ATCCS. The outcome of the analysis indicates that if assumptions regarding SOF message format compatibility with ATCCS software are met, the SOCCE will be able to operate with two maneuver control systems (MCS), which is the integration component of ATCCS. The analysis also indicates that, in addition to the existing operations center, the SOCCE will require a signal center to link the operations center with other headquarters within the electronic battlefield command and control architecture. Personnel augmentation will be necessary to fully staff the SOCCE operations center S2 (intelligence) and S3 (operations) functions for 24-hour operations. Recommendations are that the equipment and personnel requirements identified by this analysis be verified during field training exercises and by simulation and modeling, a van or vehicular mounted shelter configuration be considered to house a SOCCE, and documentation be initiated to establish requirements for a system acquisition program.
