13. ABSTRACT (Maximum 200 words) A technology demonstration of Ford F-150 series bifuel [compressed natural gas (CNG) or gasoline] Qualified Vehicle Modifier (QVM) vehicles was conducted at Ft. Bliss, Texas. The demonstration program at Ft. Bliss was a continuation of the initial fleet of General Motors dedicated CNG 1992 pickup trucks, which was prematurely halted due to CNG cylinder failures at locations other than Ft. Bliss. This Department of Energy sponsored fleet consisted of 25 General Services Administration (GSA) owned, Army leased 1995 bifueled Ford F-150 1/2-ton pickup trucks. The data that this demonstration would yield included overall engine performance, vehicle operation and maintenance, fuel economy, and assessment of exhaust emissions. As a result of this demonstration program, the data has shown that the bifueled vehicle fleet's performance was extremely satisfactory. Mechanically, the vehicles performed equally satisfactorily with gasoline and CNG fuel. The combined gasoline and CNG fuel economy calculated from actual usage data shows an 11-percent decrease when compared to the regulated federal test procedures (FTP) calculations. FTP emissions tests were performed on three selected vehicles using CNG and gasoline fuels at 4,000-, 10,000- and 20,000-mile intervals. The data showed dramatic reductions in non-methane organic gas, non-methane hydrocarbons, and carbon monoxide when operated on CNG. There was, however, a small increase in oxides of nitrogen emissions with CNG.

EXECUTIVE SUMMARY

Problems and Objectives: A technology demonstration of Ford F-150 series bifueled (compressed natural gas [CNG] or gasoline) Qualified Vehicle Modifier (QVM) vehicles was conducted at Ft. Bliss, Texas. This Department of Energy (DOE) sponsored effort was in support of Section 400-AA of the Alternative Motor Act (AMFA) of 1988, the Clean Air Act (CAA) Amendments of 1990, and the Energy Policy Act of 1992. The objectives of the program were to 1) demonstrate the acceptability of alternative-fueled vehicles in a Department of Defense (DOD) U.S. Army activity in support of installation operations, 2) to quantify vehicle performance and fuel economy, and 3) to assess exhaust emissions using CNG and gasoline fuel in selected vehicles.

Importance of Project: With emphasis on finding methods to reduce the amount of pollutants in the air, CNG fuel definitely offers a viable alternative. This technology demonstration provided real-world utilization and performance data on QVM CNG and gasoline bifueled vehicles. Also, the previous fleet of dedicated CNG vehicles presented a problem because random vehicle assignments were not possible due to restricted range. With the introduction of bifueled vehicles, range was no longer a factor, and vehicles could be assigned anywhere in the operating area.

Technical Approach: The fleet of General Services Administration (GSA)-owned, Army-leased bifueled vehicles was placed under the direction of the Ft. Bliss Transportation Division. The vehicles were randomly assigned to the different service sections to be used in daily mission requirements. Twenty-five vehicles were randomly selected by the transportation officer to provide the data required. Designated drivers of the bifuel vehicles attended classes that covered topics such as program background and objectives, CNG description and fueling procedures, and data collection procedures.

Accomplishments: More than 300,000 miles of combined CNG and gasoline usage were accumulated during the program. There were no major problems reported, and the drivers, as well as section supervisors, favorably received the vehicles. The most prevalent complaints while operating with CNG fuel were the limited range, the distance to the CNG fueling facility located outside the installation, and the prolonged starting time. Mechanically, the vehicles performed satisfactorily, and of the 25 vehicles monitored, only two required maintenance. Federal Test Procedures (FTP) exhaust emissions testing was performed at Southwest Research Institute (SwRI) on three selected vehicles at 4,000-, 10,000- and 20,000-mile intervals. The selected vehicles when operated on CNG showed dramatic reductions in non-methane organic gas (NMOG), non-methane hydrocarbons (NMHC), and carbon monoxide (CO). There was a small increase in oxides of nitrogen (NO_x) emissions while using CNG. Fuel economy was equivalent with CNG and gasoline when compared to FTP results.

Military Impact: U.S. military installations continue to provide an excellent avenue to introduce alternative fuels. Therefore, the data accumulated during this demonstration program can be used in the decision-making process of assigning GSA bifueled vehicles to military installations. Also, the demonstration clearly shows the need for alternative fueling infrastructure in the immediate vicinity of the fleet.

FOREWORD/ACKNOWLEDGMENTS

This work was performed by the U.S. Army TARDEC Fuels and Lubricants Research Facility (TFLRF) located at Southwest Research Institute (SwRI), San Antonio, Texas, during the period August 1995 through May 1997 under Contract No. DAAK70-92-C-0059. The work was funded by the U.S. Department of Energy (DOE) and administered by the U.S. Army Tank-Automotive RD&E Center (TARDEC), Petroleum and Water Business Area, Warren, Michigan. Mr. Lee Slezak (CE-322) served as the DOE project technical monitor, Mr. Luis Villahermosa (AMSTA-TR-D/210) served as the TARDEC contracting officer's representative and project technical monitor.

The authors would like to acknowledge the assistance provided by Mr. Robert Galindo, Transportation Division, Ft. Bliss, Texas, for his untiring support throughout the demonstration program. Also special mention is given to Mr. Bernard Jones, GSA Fleet Management Office, El Paso, Texas, for his assistance in the data gathering effort.

The authors would like to recognize the technical support and guidance provided by Mr. E.A. Frame of TFLRF. Special thanks is given to Ms. Wendy Mills of TFLRF for her help in the preparation and editing of this report.

I. BACKGROUND

Section 400-AA of the Alternative Motor Fuels Act (AMFA) of 1988, Public Law 100494, established The Federal Light Vehicle Program.(1)* The AMFA's aim is to incorporate alternative-fuel vehicles (AFVs) into government fleet operations and evaluate their performance. The Department of Energy (DOE) is responsible for implementing the AMFA with the assistance of other agencies.(2) Federal fleets, as defined in the Energy Policy Act (EPACT) of 1992, are required to comply with Executive Order 13031 in their acquisitions of AFVs.(3,4) Natural gas has demonstrated considerable potential as a cleaner-burning fuel for motor vehicles than gasoline. Also, the number of compressed natural gas (CNG) fuel vehicles has increased dramatically since the start of the AMFA program. Substituting cleaner-burning alternative fuels in motor vehicles has drawn considerable attention in the last decade. The driving forces for this substitution are the reduction of crude oil dependence and the reduction or elimination of some pollutant emissions—especially ozone-forming hydrocarbons. Increased use of alternative “clean burn” fuels for motor vehicles has escalated to a prominent role in the ongoing air pollution control strategies for California and the federal government.(5)

II. INTRODUCTION

This technology demonstration was sponsored by DOE under an interagency agreement between DOE and the U.S. Army Tank-Automotive Research, Development and Engineering Center (TARDEC).(6) The agreement was executed to provide for U. S. Army support of AMFA. After the fleet of dedicated General Motors 3/4-ton original equipment manufacturer (OEM) pickup trucks was prematurely halted at Ft. Bliss, Texas, the General Services Administration (GSA) made an acquisition of over 100 Ford F150 bifuel (CNG or gasoline) Qualified Vehicle Modifier (QVM) pickup trucks.(7) The vehicles were distributed between Ft. Hood, Texas and Ft. Bliss, Texas. Twenty-five of the vehicles assigned to Ft. Bliss were selected to be in the demonstration program. Ft. Bliss was chosen because of its location in El Paso, Texas—a non-attainment air quality area designated by the Environmental Protection Agency (EPA).

* Underscored numbers in parentheses refer to list of references at end of document

Liaison/coordination meetings with transportation motor pool (TMP) personnel at Ft. Bliss and the GSA Fleet Management Office in El Paso were conducted by the monitor from the U.S. Army TARDEC Fuels and Lubricants Research Facility (TFLRF), located at Southwest Research Institute (SwRI) in San Antonio, Texas.

III. PROGRAM OBJECTIVES

The objectives of the technology demonstration of QVM bifuel (CNG or Gasoline) vehicles were as follows:

- To demonstrate the acceptability of bifuel GNG or gasoline vehicles in support of AMFA, and in a Department of Defense U. S. Army activity in support of post camp and station operations;
- To quantify vehicle performance, fuel economy, engine performance and maintenance;
- To assess regulated emissions using both gasoline and CNG fuels

IV. DETAILS OF DEMONSTRATION

A. General

Training classes were conducted for designated drivers of the test vehicles and for selected TMP personnel at Ft. Bliss prior to the start of the program. Topics included the following:

- Program background and objectives
- CNG description and precautions
- Bifuel AFV description
- Program data collection objectives
- Data-collection procedures and responsibilities

The TMP division at Ft. Bliss assigned the bifuel vehicles to the different sections and units in the same manner as the regular vehicles without regard to driving cycles and mission requirements. The only concession was assigning the vehicles within the area in which the CNG-fueling facility was available to the drivers. The vehicles were dispatched on a weekly basis, and the drivers were instructed to turn in the previous week's operational information prior to the next week's dispatch.

The GSA fleet offices at Ft. Bliss and El Paso agreed to provide quarterly maintenance records on the 25 selected test vehicles.

Meetings were held with GSA and TMP staff to coordinate the selection of three test vehicles for emissions testing at selected intervals throughout the duration of the demonstration program. The transportation officer handled the selection of vehicles for emissions testing to minimize the impact that random selection of critical-use vehicles would incur. The vehicles were transported from El Paso to SwRI for testing, which required a turnaround of five working days. Testing included the Federal Test Procedure (FTP) for regulated emissions, Highway Fuel Economy Test (HFET), and full hydrocarbon speciation. Testing was conducted at 4,000-, 10,000-, and 20,000-mile intervals.

The TFLRF monitor visited El Paso and Ft. Bliss monthly to liaise with GSA and TMP fleet managers, collect usage data, and solicit user comments on the operability of the test vehicles.

B. Fleet Vehicle Description

The 25 GSA-owned, Army-leased vehicles used for the demonstration were 1995 Ford F150 bifuel 1/2 ton pickup trucks with a gross vehicle weight (GVW) rating of 6,200 lbs. (Figure 1). The vehicles were converted to use CNG by Southern Union Gas Company in Austin, Texas, under Ford Motor Company's QVM Ford F-Series 4.9L bifuel prep vehicle program. Unique features of the 4.9L engine included exhaust valve seat inserts, hard faced exhaust valves, corrosion resistant intake valves, hardened intake valve seats, positive valve rotation, and revised intake valve springs. Collectively, these features insured improved valve train durability. Other components included upgraded front springs to accommodate the gaseous fuel system and unique vehicle identification that provided service technicians with vehicle conversion data. The F Series vehicles modified for natural gas included natural gas tank (in-bed, 8.4 equivalent gallons), natural gas tank (under body, 3.8 equivalent gallons), natural gas fill receptacle, natural gas system shut-off valve, natural gas regulator assembly, 4.9L gaseous fuel prep engine, gasoline tank (18.2 gallons), and gasoline filler. Figure 2 illustrates the prep vehicle CNG modifications.(8) The vehicles tested at Ft. Bliss were configured as Package #1 (Figure 2b). The power train consisted of a 4.9L engine coupled to an E40D automatic transmission. All trucks were equipped with air conditioning and power steering.

Table 1 lists the characteristics of the test vehicles, including odometer reading and test start date.

C. Data Collection

Data were provided in the following formats by the following sources at FT. Bliss and El Paso:

Vehicle weekly log sheets – Drivers were instructed to enter operational data to include performance problems for a selected period of time in the log sheet provided by the TFLRF monitor. TMP dispatch personnel collected the log sheets from the drivers at the end of each week and mailed the log sheets to the TFLRF monitor each month.

Daily/Monthly Utilization Record – Ft. Bliss TMP procedures required the vehicle operators to maintain the utilization record in their possession as proof of dispatch and to enter daily operational usage data, which included vehicle tag number, beginning and ending odometer readings, total miles driven, and total fuel added. TMP dispatch personnel collected the utilization records from the drivers and mailed the forms to TFLRF.

Gasoline Fuel Issue Record – Ft. Bliss TMP administrative personnel provided the TFLRF monitor with the monthly automated gasoline fuel issue record, which included date, vehicle tag number, odometer reading, and total gallons dispensed.

CNG Fuel Issue Record – The GSA Fleet Management Office provided the TFLRF monitor with monthly invoices from C and R Distributing Inc. for all CNG fuel issues from the commercial facility. The record contained vehicle tag number, date, total gallons dispensed, and odometer reading.

Repair Invoices – The local Ford dealer in El Paso, with permission from the GSA Fleet Management Office, provided the TFLRF monitor with invoices of fuel component repairs.

D. Fueling Stations

1. Compressed Natural Gas

The CNG fueling station is a privately owned, card lock unattended facility located at Interstate 10 and Airway Boulevard in El Paso, approximately 5.5 miles from the bifuel vehicle motor park at Ft. Bliss. The station was equipped with a 425-cfm compressor, a 100-gallon-equivalent capacity storage tank, and a two-nozzle dispenser with Sherex quick disconnects with a maximum fill pressure of 3,000 psi. Figure 3 shows the CNG dispensing station at Interstate 10 and Airway Boulevard in El Paso. Ft. Bliss and Southern Union Gas Company personnel made several attempts to have a CNG fueling facility constructed adjacent to the gasoline fueling facility at Ft. Bliss; however, funding shortages prohibited the closing of any agreements. The DOE contract program officer also attempted to fund facility construction to no avail.

2. Gasoline

The gasoline fueling station at Ft. Bliss is a DOD-operated facility located at the TMP. The station is a card lock automated facility, and the fuel is delivered to underground tanks by a local refinery under contract. Figure 4 shows the gasoline fueling facility located inside the installation at the TMP. Ft. Bliss is in a carbon monoxide non-attainment area; therefore, reformulated gasoline is utilized by all gasoline-burning vehicles. TFLRF conducted a short fuel-sampling program at Ft. Bliss. Findings were reported in Letter Report BFLRF No. 94-002.(9)

V. RESULTS OF DEMONSTRATION

A. Fleet Test Results

1. General

The 25 test vehicles accumulated 300,943 miles of operation from August 1995 through May 1997. Monthly mileage and fuel-usage summaries for each test vehicle are included in Appendix A. The demonstration program was scheduled to end in December 1996; however, in an agreement (10) between the DOE contract officer and the TFLRF monitor, the program was extended through May 1997.

2. Fuel Economy

A summary of the fuel economy data for the test vehicles is presented in Table 2. Individual summaries for each of the 25 test vehicles are included in Appendix A. The fuel economy, calculated from usage data on the bifuel vehicles, is a combination of gasoline and CNG fuels. The energy conversion for the El Paso area was 128 cubic feet of natural gas per equivalent gallon. Figure 5 shows gasoline and CNG usage by vehicle throughout the program. Figure 6 shows the total mileage accumulation by vehicle. The highest mileage accumulation was 32,447 miles and the lowest was 5,457 miles. Figure 7 is a presentation of fuel economy by vehicle. Fuel economy ranged from 11.9 to 14.6 mpg, with an average of 13.4 mpg. Figure 8 shows the averaged combined gasoline and CNG actual fleet data compared to the combined averaged FTP results. The EPA mileage specification report (11) for the 1995 F150 series trucks with the 4.9L engine lists the city driving cycle gasoline fuel economy at 15 miles per gallon. The actual fleet data shows a difference in fuel economy of approximately 11 percent between the averaged FTP results and the EPA's mileage specification report. This difference can be attributed to the duty cycle of the vehicles.

3. Fuel System Component Replacement

The test vehicles were under manufacturer's warranty throughout the demonstration program. An authorized Ford dealership in El Paso performed all unscheduled repairs on the bifuel vehicles. Collectively, the vehicles performed extremely well. Two unscheduled maintenance actions were

reported and repaired during the demonstration program. Vehicle No.4272045 failed to start in the CNG mode. The wiring assembly was repaired. Vehicle No.4272038 developed a gas leak around the mid-ship tank. The fuel line from mid-ship tank to union was replaced. All vehicles underwent an in-bed mounted CNG tank re-strapping modification to prevent shifting. The warranty work was performed under Ford's Technical Service Bulletin recall No. 95011F.

Table 2. Summary of Test Vehicle Data Miles and Combined CNG/Gasoline Consumption					
Vehicle Tag No.	Total Program Miles	Gallons Gasoline	Gallons CNG	Gallons/Mile	Miles/Gallon
4272027	7,589	528.5	49.3	0.076	13.1

Figure 6. Total Mileage Accumulation

Figure 7. Fuel Economy by Vehicle

Figure 8. Fuel Economy Comparison: Fleet Data Vs. FTP Data

4. Vehicle Performance

The performance of the test vehicles was assessed by requiring the drivers to rate the degree of severity of eight performance-problem variables catalogued on the driver's daily log sheet. An "A" signified mildly annoying, while "T" signified very troublesome. The vehicle performance data was gathered for 11 months and was discontinued when only a few selected drivers were reporting performance problems. Table 3 presents a monthly performance-problem summary, while Table 4 summarizes the driver's responses to noted performance problems. The most prevalent performance problems reported on the bifueled vehicles were "hard to start," "lack of power," and "acceleration." Table 4 shows that these three variables constitute 57 percent of the performance problems reported, while "idle quality," "stalled after starting," and "stalled in traffic," make up 30 percent of the problems reported, and "pinging" and "hesitation" account for the remaining 13 percent. Figures 9 through 12 graphically present the frequency of performance problems reported and the number of vehicles reporting difficulties for the eight performance problems studied. The data reflect a sharp decline in reported performance problems beginning in December 1996 for all except "hard to start." Also, the same problems were appearing only on a selected number of vehicles. GSA maintenance personnel inspected these vehicles, and all systems were within normal parameters.

5. Resolution of User Concerns

It was the practice throughout the demonstration program to investigate users' concerns on the operability of the bifueled vehicles. Therefore, drivers' comments were solicited at every site visit. Without exception, every driver queried complained of the vehicle's longer starting time, lack of power, and acceleration while using CNG fuel. Early into the program, TFLRF staff conducted cold/hot start and full throttle acceleration tests using CNG and gasoline fuels to determine the severity of the complaint.

Table 3. Bifuel Fleet Monthly Performance Problem Summary -August 1995 Through June 1996

Performance Problem	August		September		October		November		December		January		February		March		April		May		June

Pinging	166	5
	1669	470

* A = Mildly annoying

** T = Very troublesome

Figure 9. Frequency of Reported Performance Problems

Figure 10. Frequency of Reported Performance Problems

Figure 11. Vehicles Reporting Some Kind of Performance Problem

Figure 12. Vehicles Reporting Some Degree of Performance Problem

a. Cold/Hot Start Tests

Two cold and two hot starts were performed on a single bifuel vehicle. The engine cranking time to start was recorded in seconds. Results demonstrated that, while using CNG fuel, the cranking time required to start the engine increased an average of 2 seconds during the cold-start phase and 1.6 seconds during the hot-start phase. Figures 13 through 16 show the individual and averaged cold/hot start test results.

b. 0-50mph Full-throttle Acceleration Tests

Full-throttle acceleration tests measure the time required to reach a given speed. The acceleration times of a given engine are a function of the work produced by the engine. The developed work and subsequent rate of work (power) are a function of the volume and energy of the injected fuel. The fuel-energy density and the injected volume determine the energy content of the injected fuel. Combustion factors that determine power availability with a fuel are the thermal efficiency of the combus-

tion and the energy conversion processes. The aforementioned factors all contribute to the work and power development of an engine, which affect the vehicle acceleration times when a fuel conversion is made. Power loss was expected because of the lower volumetric heating value of CNG compared to gasoline, therefore the volume of fuel delivered with CNG would have lower energy content than the equivalent gasoline. Full-throttle, 0-50mph accelerations were performed on a single bifuel vehicle using gasoline and CNG fuels. Twelve individual runs were performed with each fuel. Six acceleration runs were performed in each direction. The time in seconds to reach 50 mph was recorded for each run. To stabilize engine temperature and performance, the vehicle was operated a minimum of two miles at normal operating conditions after each of the six acceleration runs. Results of the acceleration runs while operating with CNG versus unleaded gasoline showed that the average elapsed time to accelerate from 0 to 50 mph increased three seconds. These data are summarized in Figures 17 and 18. The increase in acceleration time with CNG is within the expected parameters based on the difference in energy content between CNG and gasoline fuels. (12)

6. Fuel Quality

CNG fuel was monitored by performing compound analyses on samples obtained from the test vehicles that were shipped to SwRI for emissions evaluations. All of the test vehicles were fueled at the same location; therefore, the results of the samples obtained from these vehicles are representative of the CNG fuel quality in El Paso. Table 5 presents the results of the compounds found in the samples. Methane constituted 94 percent of the gas composition, while constituents such as ethane, nitrogen, carbon dioxide, and propane made up the remaining six percent. All the samples conformed to the typical volumetric and mass base composition of natural gas. (13)

B. Emissions Testing

1. General

The objective of testing the exhaust and evaporative emissions was to provide a method to compare the unburned hydrocarbons while operating with both CNG and gasoline fuels, and assess the benefits and/or penalties of using CNG as an alternative fuel.

Table 5. Fort Bliss CNG Fuel Samples					
	Mole Percent				
Constituent	12/11/95	2/26/96	8/27/96	7/28/97	Average
Methane	93.88	93.94	94.16	93.16	93.79
Ethane	2.95	2.85	2.92	2.85	0.89

Total	100.0	100.0	100.0	100.0	-----

Three test vehicles were selected for emissions testing at 4,000-, 10,000-, and 20,000-mile intervals. The testing was conducted by the Department of Emissions Research at SwRI (an EPA-certified emissions testing laboratory). The vehicles were tested utilizing the FTP schedule for light-duty vehicles. (14)

2. FTP Exhaust Emissions and HFET Fuel Economy

The exhaust emissions of three bifuel vehicles were quantified using the Light-Duty Vehicle FTP. The bifuel vehicle emission measurements were determined while operating the vehicles on gasoline and CNG. The exhaust emission measurements were made at 4,000, 10,000, and 20,000 miles for each vehicle. The FTP exhaust emissions and HFET fuel economy results are included as Appendix B.

The averaged FTP unburned exhaust emissions, highway fuel economy test results at three mileage intervals, and overall averaged results are shown in Table 6. Also shown are the EPA's standards for total hydrocarbons (THC [gasoline exhaust only]), non-methane hydrocarbons (NMHC), carbon monoxide (CO), and oxides of nitrogen (NO_x).

Figure 19 compares the averaged FTP unburned hydrocarbons emissions with the EPA's standards for light duty vehicles. The THC standard applies to gasoline fuel only.

Table 6. Averaged Unburned FTP Regulated Emissions and Highway Fuel Economy Test (HFET) Results of Three Bifueled Vehicles at 4,000-, 10,000-, and 20,000-Mile Intervals

Test Fuel Miles	Gasoline				CNG			
	4,000	10,000	20,000	Average	4,000	10,000	20,000	Average
Exhaust Emissions								
THC, g/mile	0.52	0.53	0.44	0.5	2.7	2.62	2.48	2.6

NMHC, 0.32 g/mile

CO, 4.4 g/mile

Nox, 0.7 g/mile

* = Gasline Only

Comparison of Averaged FTP Unburned Hydrocarbon Emissions Results

Figure 19. Comparison of Averaged FTP Unburned Hydrocarbon Emissions Results

Figure 20 shows the averaged unburned hydrocarbon emissions at three mileage intervals for the three vehicles. Figure 20 reveals the Total Hydrocarbon (THC), Non-Methane Organic Gas (NMOG), and Non-Methane Hydrocarbon (NMHC) response for each fuel. As expected, the THC response is substantially higher for CNG use. The NMOG and NMHC results indicate substantial reductions in higher molecular weight hydrocarbon emissions when CNG is used. Figure 21 shows the THC emissions for each vehicle and fuel at each mileage interval evaluated. Figure 22 displays NMHC emissions for each vehicle and fuel at each mileage interval. Figures 21 and 22 indicate that when gasoline was used vehicle 72031 showed reductions in hydrocarbon emissions with mileage, vehicle 72038 showed fairly consistent results at each mileage interval, and vehicle 72051 revealed increasing hydrocarbon emissions as mileage increased. Figures 21 and 22 also indicate that when CNG was utilized, vehicle 72031 showed fairly consistent results for THC, and decreasing NMHC, at each mileage interval; vehicles 72038 and 72051 revealed decreasing THC emissions, but increasing NMHC as mileage increased.

Figure 20. Averaged FTP Unburned Hydrocarbon Emissions

Figure 21. FTP Total Unburned Hydrocarbon Emissions

Figure 22. FTP Non-Methane, Hydrocarbon Emissions

The carbon monoxide (CO) emissions for each vehicle, fuel, and mileage interval are shown in Figure 23. When using gasoline, CO emissions dropped with increasing mileage for vehicles 72031 and 72038, and increased with mileage for vehicle 72051. When using CNG, CO emissions generally increased with increasing mileage for all vehicles, but remained at levels lower than with gasoline use.

The oxides of nitrogen (NOx) emissions for each vehicle, fuel, and mileage interval are shown in Figure 24. When using gasoline, NOx emissions dropped with increasing mileage for vehicle 72031, and generally increased with mileage for vehicles 72038 and 72051. When using CNG, NOx emissions for vehicle 72031 remained fairly consistent, and generally increased with increasing mileage for vehicles 72038 and 72051. Overall, the NOx emission levels with CNG were slightly higher than with gasoline use.

The Federal Light-Duty HFET was also performed on each vehicle, fuel, and mileage combination. Figure 25 reveals the fuel economy results for each vehicle, fuel, and mileage interval. Except for vehicle 72051, vehicle fuel economy with gasoline improved with increasing mileage. With CNG

utilization, all vehicles showed an improvement in fuel economy at the 10,000-mile interval, followed by a reduction in fuel economy at the 20,000-mile interval. Figure 26 shows the vehicle averaged fuel economy for both fuels at each mileage interval, and the overall average. The overall average fuel economy is slightly higher for gasoline utilization.

Figure 27 is an overall summary of the bifuel vehicle emission and fuel economy deviations between gasoline and CNG. Overall, the exhaust emission levels were fairly consistent at each mileage interval regardless of fuel utilized. The vehicles operating on CNG showed dramatic reductions in non-methane organic gas (-65%), non-methane hydrocarbons (-91.4%), and carbon monoxide (-66.4%) emissions compared to gasoline operation. The vehicles operating on CNG revealed a small increase for oxides of nitrogen (6.4%) emissions compared to gasoline operation. The vehicles with CNG fuel operation revealed a marginally lower fuel economy (-2.2%) than when operated on gasoline. Generally, the fuel economy for each vehicle and fuel combination increased slightly between the 4,000- and 10,000-mile intervals, then remained consistent or declined between the 10,000- and 20,000-mile intervals.

Figure 26. Average HFET Fuel Economy

Figure 27. Bi-Fuel Vehicle Emissions and Fuel Economy Deviations with CNG

3. Species Emissions

Total unburned hydrocarbon FTP exhaust emissions for the three bifuel vehicles are tabulated in Appendices C-E. The selected species compounds complied with NREL data collection guidelines (15) for the fuel each vehicle utilized and are tabulated in Appendix (F). The results of the speciation were utilized to calculate the ozone-forming potential for each vehicle and fuel. The potential ozone formed was calculated using Maximum Incremental Reactivity (MIR) factors for the Los Angeles air basin model published by Mobile Sources Division, California Air Resources Board. (16)

Figure 28 shows the averaged potential grams of ozone formed per mile for each fuel, at each mileage interval. Ozone was calculated accounting for potential ozone formed from methane and NMOG emissions. Total potential ozone includes the contribution of the methane in the exhaust. Although methane has a very low MIR (0.0148g O₃/g vs. ethylene at 7.29g O₃/g), the substantial mass of methane in CNG exhaust makes methane a major contributor to CNG vehicle ozone-forming potential. The potential ozone formed by NMOG in Figure 28 reveals the ozone-forming potential of the bifuel vehicle exhaust when debited for methane contribution.

Figure 28. Vehicle Average Potential Ozone Formation, gms/mile

Approximately 89 percent of the potential ozone formed by CNG exhaust emissions is due to the following compounds: methane (28.9%), ethylene (22.6%), ethane (19.6%), formaldehyde (10.7%), propane (4.0%), and propylene (3.5%) in the exhaust. Likewise only 41-percent potential ozone formed by gasoline exhaust emissions is due to the following compounds: methane (0.3%), ethylene (22.0%), ethane (0.7%), formaldehyde (3.0%), propane (0.1%), and propylene (15.1%). The balance of potential ozone formed by the gasoline vehicle is from higher molecular weight hydrocarbons containing double and triple bonds, with toluene (27.3%) being the largest contributor. The averaged potential ozone contributions of the three bifuel vehicles for gasoline and CNG (by species, at each mileage interval) and the overall average are shown in Table 7.

Table 7. Contribution to Ozone-Forming Potential from Speciated Emissions									
Fuel	Gasoline					CNG

The mileage variation of NMOG mass emissions for each vehicle and fuel are shown in Figure 29. Except for vehicle G24-72051, the gasoline NMOG emissions generally decreased with mileage accumulation. While operating on CNG, the vehicles displayed increased NMOG emissions with mileage accumulation. The corresponding mileage variation of potential ozone formation by the NMOG constituents for each vehicle and fuel are displayed in Figure 30.

Figure 31 displays the Specific Reactivity (SR) for each vehicle and fuel at each mileage interval. The SR is a measure of the potential ozone reactivity of the NMOG emissions of a vehicle and fuel combination. The SR is defined in Reference (16) for a fuel as the summation of the mass of potential ozone formed by the individual NMOG species, divided by the summation of the emitted mass of the individual NMOG species as shown below.

$$SR_{fuel} = \frac{\sum_{fuel} \frac{g \text{ NMOG}_i}{\text{mile}} \times MIR_i \left(\frac{g \text{ O}_3}{g \text{ NMOG}} \right)}{\sum_{fuel} \frac{g \text{ NMOG}_i}{\text{mile}}} = \frac{g \text{ O}_3}{g \text{ NMOG}}$$

Figure 29. Total Mass Emission of NMOG Species

Figure 30. Potential Ozone Formation from NMOG Constituents

Figure 31. Specific Reactivity of NMOG Emissions

Reference (16) defines the Reactivity Adjustment Factor (RAF) for alternative-fuel vehicles, which compares the SR of an alternative fuel, to the SR of the reference fuel. In this case, the RAF is calculated for CNG utilization as follows using the SRs for CNG and gasoline.

$$RAF_{CNG} = \frac{SR_{CNG}}{SR_{Gasoline}} = \frac{0.7589 \frac{gO_3}{gNMOG}}{3.0335 \frac{gO_3}{gNMOG}} = 0.25$$

The RAF indicates that the Ft. Bliss bifuel vehicles have ozone-forming potential from the NMOG constituents while operating on CNG, which is only 25 percent of, or 75 percent lower than, gasoline operation. The corresponding mileage variation of the CNG fuel RAF for each vehicle and the averages are displayed in Figure 32. The Ft. Bliss bifuel vehicle CNG RAF value is substantially lower than the CARB generic RAF value for CNG vehicles of 0.43 proposed in Reference 14. The CARB generic RAF value was an average RAF for seven unique CNG vehicles. The current data also contrasts with the earlier Ft. Bliss CNG study, Reference 7, that indicated a 0.47 RAF value. The earlier Ft. Bliss study utilized dedicated CNG vehicles versus the bifuel vehicles in the present study.

Figure 32. Reactivity Adjustment Factor for CNG Operation

VI. CONCLUSIONS

Use of the Ford F150 QVM bifuel vehicle at Ft. Bliss, Texas demonstrated that operation of bifuel vehicles in support of post-camp and station operations is feasible and prudent. The ability of the bifuel vehicles to use either compressed natural gas (CNG) or gasoline permitted the assignment of the vehicles to sections with areas larger than the maximum range of the vehicle in the CNG mode. The bifuel vehicles were readily accepted as a viable alternative to the dedicated gasoline vehicle.

The Ford bifuel vehicles proved to be highly reliable in that only two fuel-component maintenance actions were recorded during the 24-month period in which maintenance data were tracked. This statement contradicts the amount of performance problems reported by the drivers at the beginning of the demonstration. However, there is always the usual resistance exhibited by drivers when a fleet is changed over from a trusted fuel such as gasoline to an "experimental" fuel such as CNG with a limited track record. The drivers' most prevalent performance problems reported while operating with CNG were hard starting, lack of power, and acceleration. Hot/cold starts and full throttle acceleration tests were performed on one bifuel vehicle. Results indicated that the cranking time in the CNG mode increased an average of 1.8 seconds, and acceleration time to reach 50 mph during the full throttle evaluations increased 3 seconds. According to the General Services Administration (GSA) maintenance automotive technicians, the only variable that was noticeable was the longer starting time in the CNG mode. Lack of power and hesitation were not noticeable under normal operating conditions with either CNG or gasoline.

The averaged combined CNG and gasoline fuel economy calculated from actual usage data shows an 11-percent decrease compared to the combined Federal Test Procedure (FTP) results. This difference can be attributed to the short start-and-stop duty cycle of the test vehicles during the demonstration program.

The exhaust emission levels were fairly consistent at each mileage interval regardless of fuel used. The vehicles operating on CNG demonstrated significant reductions in non-methane organic gas (NMOG), non-methane hydrocarbons (NMHC), and carbon monoxide (CO) emissions compared to gasoline operation. Operation with CNG, however, reveals a slight increase in oxides of nitrogen (NOx) emissions compared to gasoline operation.

The speciated emissions allow the calculation of a Reactivity Adjustment Factor (RAF), as defined by the California Air Research Board, for potential ozone formation from NMOG for the Ft. Bliss bifuel vehicles operating on CNG. The RAF suggests bifuel vehicle operation is providing only 25-percent of, or 75-percent less than, the potential ozone that gasoline operation would produce from the NMOG exhaust constituents.

The benefits in utilizing CNG as a primary fuel outweigh the use of gasoline. However, CNG usage at Ft. Bliss was only 25 percent compared to gasoline usage. The main reason for this disparity was that the CNG-fueling facility, located in a traffic-congested area 5.5 miles outside the installation, became a liability early in the program. Initially, this was not a problem; however, in order to minimize the risk of GSA vehicles being involved in accidents, the use of vehicles outside the installation was discouraged. Also, supervisors began complaining of the time it was taking to fuel the vehicles with CNG compared to gasoline, which was available at the motor pool. Several attempts were made to install a CNG-fueling facility adjacent to the gasoline pumps in the motor pool; however, funding could not be obtained.

COMPOSITE FTP TEST RESULTS
ON VEHICLE NO. 72031
AT 4,000- 10,000- AND 20,000-MILE INTERVALS

TEST NUMBER: G72031FTP4K
 TEST CAR: 1995 FORD F-150 PICKUP #31
 TEST DATE: 2/28/98
 TEST FUEL: CNG

A - 2,2-Dimethylpentane and methylcyclopentane co-elute. GC peak area split equally between the two compounds.

B - 3-Methyl-3-ethylpentane co-elutes with reported compound. Not reported separately.

C - Cis-1,4-Dimethylcyclohexane co-elutes with reported compound. Not reported separately.

D - Propylcyclopentane co-elutes with reported compound. Not reported separately.

E - 2,5-Dimethylheptane and 3,5-dimethylheptane co-elute. GC peak area split equally between the two compounds.

F - Decane and isobutylbenzene co-elute. GC peak area split equally between the two compounds.

G - n-Butylbenzene co-elutes with reported compound. Not reported separately.

H - Isobutyraldehyde and methyl ethyl ketone co-elute. LC peak area split equally between the two compounds.

TEST NUMBER: G72031FTP4K
 TEST CAR: 1995 FORD F-150 PICKUP #31
 TEST DATE: 2/27/96
 TEST FUEL: EEE

A - 2,2-Dimethylpentane and methylcyclopentane co-elutes. GC peak area split equally between the two compounds.

B - 3-Methyl-3-ethylpentane co-elutes with reported compound. Not reported separately.

C - Cis-1,4-Dimethylcyclohexane co-elutes with reported compound. Not reported separately.

D - Propylcyclopentane co-elutes with reported compound. Not reported separately.

E - 2,5-Dimethylheptane and 3,5-dimethylheptane co-elutes. GC peak area split equally between the two compounds.

F - Decane and isobutylbenzene co-elute. GC peak area split equally between the two compounds.

G - n-Butylbenzene co-elutes with reported compound. Not reported separately.

H - Isobutyraldehyde and methyl ethyl ketone co-elute. LC peak area split equally between the two compounds.

APPENDIX D
3-BAG CNG/GASOLINE TOTAL SPECIES AND
COMPOSITE FTP TEST RESULTS
ON VEHICLE NO. 72038
AT 4,000- 10,000- AND 20,000-MILE INTERVALS

TEST NUMBER: G72038FTP4K
 TEST CAR: 1995 FORD F-150 PICKUP #38
 TEST DATE: 12/13/95
 TEST FUEL: CNG

#38

A - 2,2-Dimethylpentane and methylcyclopentane co-elute. GC peak area split equally between the two compounds.
B - 3-Methyl-3-ethylpentane co-elutes with reported compound. Not reported separately.
C - Cis-1,4-Dimethylcyclohexane co-elutes with reported compound. Not reported separately.
D - Propylcyclopentane co-elutes with reported compound. Not reported separately.
E - 2,5-Dimethylheptane and 3,5-dimethylheptane co-elute. GC peak area split equally between the two compounds.
F - Decane and isobutylbenzene co-elute. GC peak area split equally between the two compounds.
G - n-Butylbenzene co-elutes with reported compound. Not reported separately.
H - Isobutyraldehyde and methyl ethyl ketone co-elute. LC peak area split equally between the two compounds.

TEST NUMBER: G72038FTP4K
 TEST CAR: 1995 FORD F-150 PICKUP #38
 TEST DATE: 12/12/95
 TEST FUEL: EEE

A - 2,2-Dimethylpentane and methylcyclopentane co-elutes. GC peak area split equally between the two compounds.

B - 3-Methyl-3-ethyl-pentane co-elutes with reported compound. Not reported separately.

C - Cis-1,4-Dimethylcyclohexane co-elutes with reported compound. Not reported separately.

D - Propylcyclopentane co-elutes with reported compound. Not reported separately.

E - 2,5-Dimethylheptane and 3,5-dimethylheptane co-elutes. GC peak area split equally between the two compounds.

F - Decane and isobutylbenzene co-elutes. GC peak area split equally between the two compounds.

G - n-Butylbenzene co-elutes with reported compound. Not reported separately.

H - Isobutyraldehyde and methyl ethyl ketone co-elutes. LC peak area split equally between the two compounds.

APPENDIX E
3-BAG CNG/GASOLINE TOTAL SPECIES AND
COMPOSITE FTP TEST RESULTS
ON VEHICLE NO. 72051
AT 4,000- 10,000- AND 20,000-MILE INTERVALS

TEST NUMBER: G72051FTP4K
 TEST CAR: 1995 FORD F-150 PICKUP #51
 TEST DATE: 12/14/95
 TEST FUEL: CNG

A - 2,2-Dimethylpentane and methylcyclopentane co-elute. GC peak area split equally between the two compounds.

B - 3-Methyl-3-ethylpentane co-elutes with reported compound. Not reported separately.

C - Cis-1,4-Dimethylcyclohexane co-elutes with reported compound. Not reported separately.

D - Propylcyclopentane co-elutes with reported compound. Not reported separately.

E - 2,5-Dimethylheptane and 3,5-dimethylheptane co-elute. GC peak area split equally between the two compounds.

F - Decane and isobutylbenzene co-elute. GC peak area split equally between the two compounds.

G - n-Butylbenzene co-elutes with reported compound. Not reported separately.

H - Isobutyraldehyde and methyl ethyl ketone co-elute. LC peak area split equally between the two compounds.

TEST NUMBER: G72051FTP4K
 TEST CAR: 1995 FORD F-150 PICKUP #51
 TEST DATE: 12/13/95
 TEST FUEL: EEE

A - 2,2-Dimethylpentane and methylcyclopentane co-elute. GC peak area split equally between the two compounds.

B - 3-Methyl-3-ethyl-pentane co-elutes with reported compound. Not reported separately.

C - Cis-1,4-Dimethylcyclohexane co-elutes with reported compound. Not reported separately.

D - Propylcyclopentane co-elutes with reported compound. Not reported separately.

E - 2,5-Dimethylheptane and 3,5-dimethylheptane co-elute. GC peak area split equally between the two compounds.

F - Decane and isobutylbenzene co-elute. GC peak area split equally between the two compounds.

G - n-Butylbenzene co-elutes with reported compound. Not reported separately.

H - Isobutyraldehyde and methyl ethyl ketone co-elute. LC peak area split equally between the two compounds.

APPENDIX F
SELECTED GASOLINE/CNG WEIGHTED FTP EXHAUST SPECIES (mg/mi)
ON VEHICLE NOS. 72031, 72038, AND 72051
AT 4,000- 10,000- AND 20,000-MILE INTERVALS
