WASHINGTON, D.C. 20233

PROJECT 1.

NUMBER OF MALES AGED 17 TO 21 FOR ARMY RECRUITING REGIONS: 1980 TO 1988

- There is a wide range in the 55 different battalion's population of males aged 17 to 21 (1st chart, table A).

- The average battalion size was about 200,000 in 1980. Twenty battalions had between 180,000 and 220,000 young men in 1980; 13 were in this category in 1985; and 7 will be in this category in 1988 (charts 1 to 3, table A).

- Eleven battalions had fewer than 150,000 young men in 1980; 18 were in this category in 1985; and 19 will be in this category in 1988 (charts 1 to 3, table A).

- The average number of young men per battalion is 198,000 in 1980; 177,000 in 1985; and 170,000 in 1988 (charts 1 to 3).

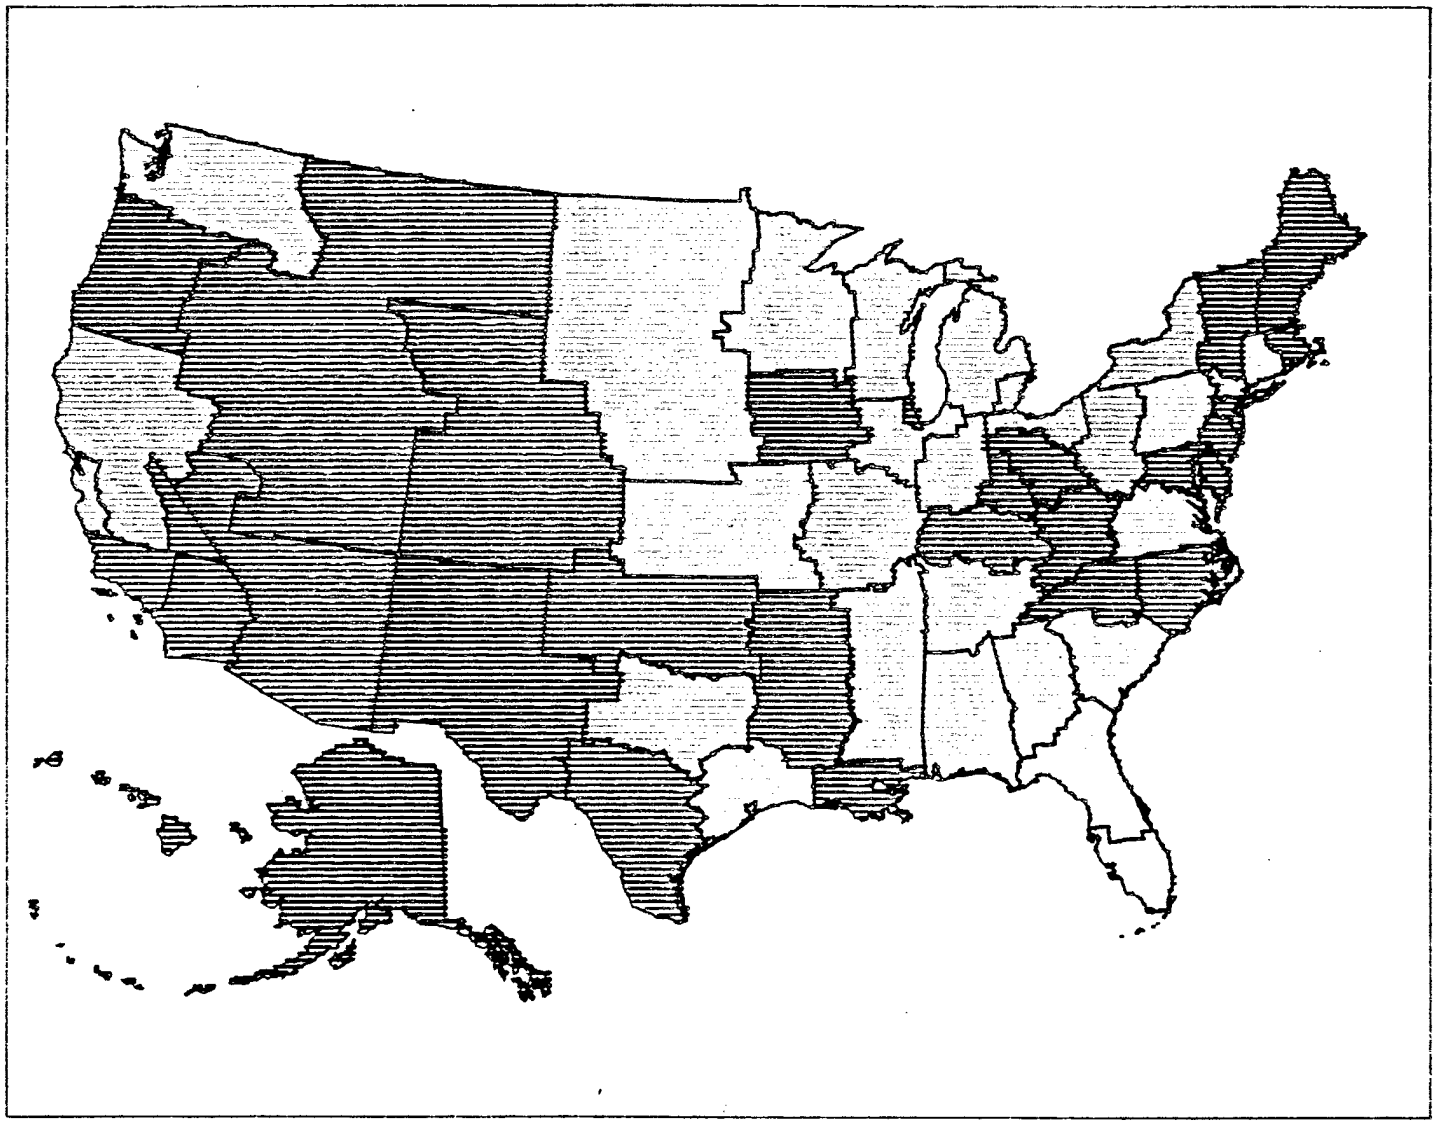

- Only 4 battalions grew in size from 1980 to 1985, but 10 will grow in size from 1985 to 1988 (charts 4 & 5, table A).

- The battalions which lost the most population from 1980 to 1985 were concentrated in the Midwest and the states bordering the Great Lakes (chart 4, table A).

- The battalions which decline the most from 1985 to 1988 are generally found in the upper Midwest, and all of the eastern United States north of Virginia (chart 5, table A).

- The battalions which will grow in size from 1985 to 1988 are generally found in the Mountain states, southeast Texas, Florida, and Georgia (chart 5).

PROJECT 2.

MALES AGED 17 TO 21 IN THE 10 LARGEST HISPANIC POPULATION STATES: 1980 TO 1988

- Most Hispanic males aged 17 to 21 are in California, Texas, and New York (1st chart and table 1).

- Over 25 percent of all young men in California, Arizona, Texas, and New Mexico are Hispanic (table 2).

- Mexicans are the largest Hispanic type in every State but New York, New Jersey, Florida, and New Mexico (2nd chart).

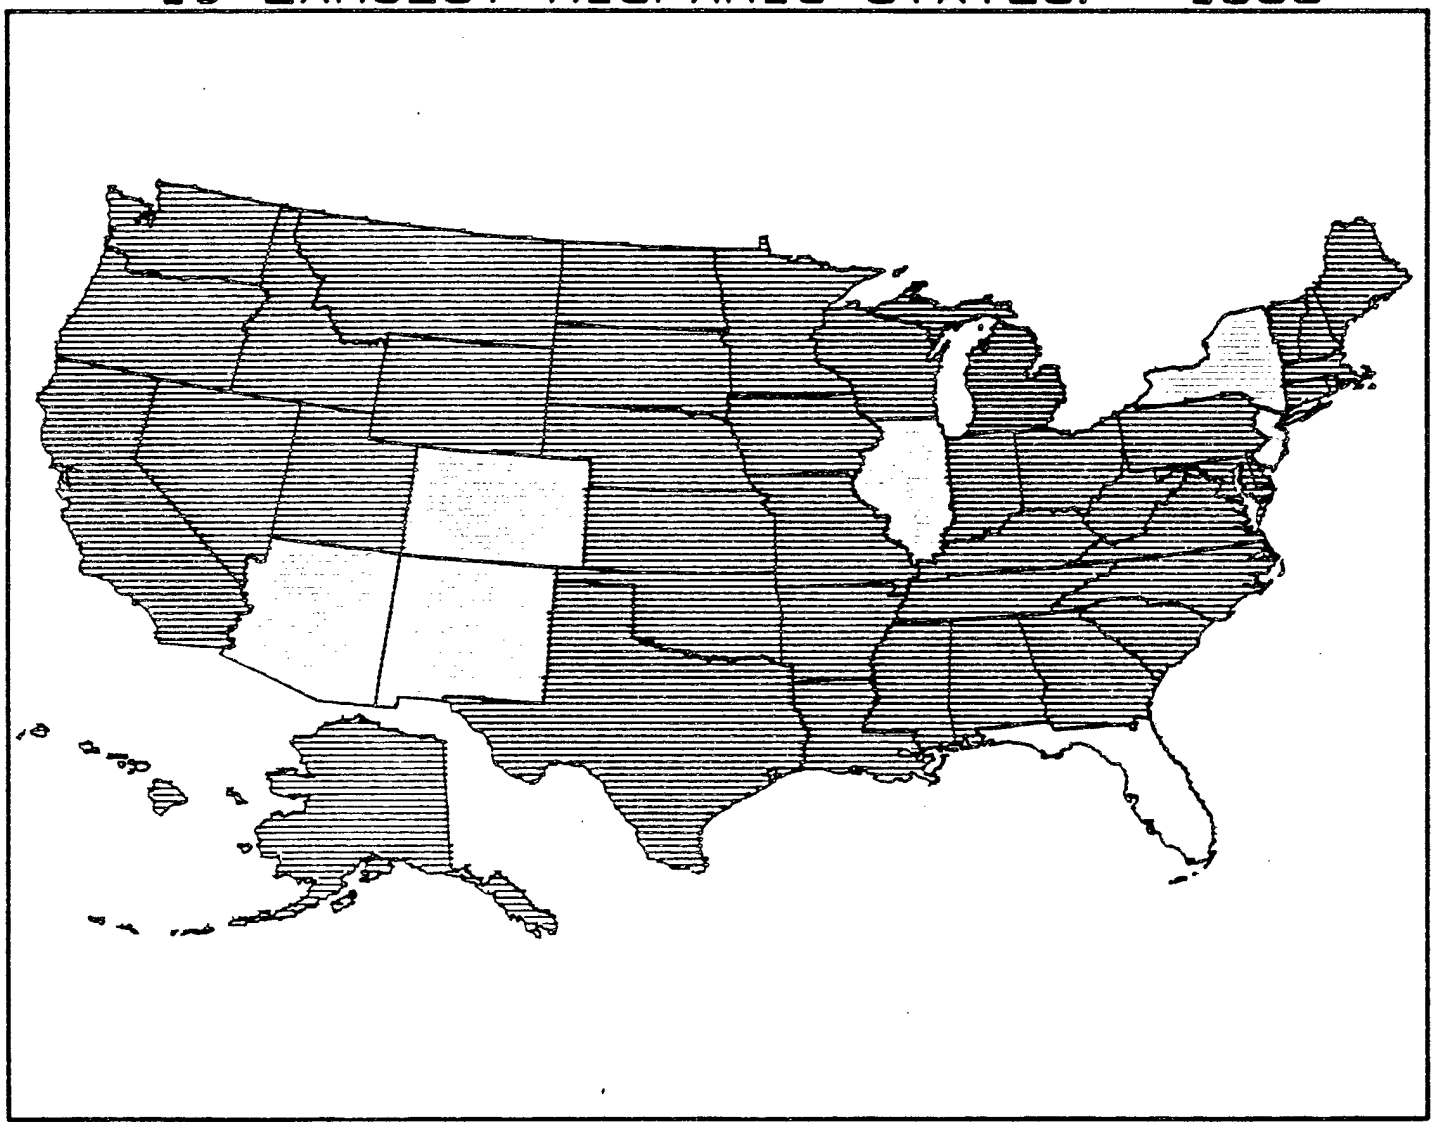

- Two-thirds of young Hispanic males in the United States are Mexican-origin (charts 3, 4, 5).

- In most States, Hispanic males aged 17 to 21 will grow more slowly from 1985 to 1988 than they did from 1980 to 1985 (charts 3 to 5, table 3).

- Hispanic males grew 100,000 from 1980 to 1988 as total males declined 1,530,000 (table 3).

- Most of the growth in Hispanic males is found in California and Texas (charts 3 to 5, table 3).

Methodology and Data Sets

A. General Notes

The battalion population figures we received from USAREC were not consistent with any Census estimates. Some were much larger than the equivalent-geography Census figure, while other USAREC numbers were much smaller. The USAREC information was not used in any of our work.

The following areas were not in the USAREC geography:

Kalawao, Hawaii (FIPS Code 15005) goes in Battalion 6E.

Yellowstone National Park, Montana (30113) goes in Battalion 6J.

Franklin, Vermont (49011) goes in Battalion 1A.

Poquoson City, Virginia (51735) goes in Battalion 3K.

Winchester City, Virginia (51840) goes in Battalion 1B.

They are included in our data bases for this project.

B. Data Sets

The following data sets were used in the construction of the projections.

1. National-level

   a. Hispanic males aged 17, 18, 19, 20, and 21 as a proportion of all such U.S. males for July 1, 1981 to July 1, 1988. The Hispanic data are from the Bureau's unpublished Hispanic projections, and the total U.S. data are from the Bureau's current estimates and projections (Series P-25, No. 952; and No. 985)

   b. Hispanic males aged 9, 10, 11, ..., 21 as a proportion of all such U.S. males for April 1, 1980. These statistics are from the modified race-modified Spanish Origin 1980 Census file. They are not published.

2. State-Level

a. Population projections (including Puerto Rico) for males aged 17, 18, 19, 20, 21 for 1981 to 1988. Each state's total population for 1981 to 1988 was also used. These state projections are consistent with the state estimates for 1985. They will not be published by the Census bureau until Spring, 1987. These projections use the most sophisticated demographic methods available. Questions about them should be directed to Signe Wetrogan on 301-763-5964.

b. Hispanic males aged 9, 10, 11, ..., 21 by Mexican, Cuban, Puerto Rican, and other Hispanic for each of the 10 largest Hispanic population states on April 1, 1980. This file of information is publicly available as a 1980 Census product.

3. County-Level

a. Total population estimates for each county in the United States for July 1, 1981 to July 1, 1985. These are the Bureau's most recent estimates which have been revised to incorporate recent changes in the estimated amount of undocumented immigration and legal emigration.

b. Males aged 9, 10, 11, ..., 21 for each U.S. county on April 1, 1980. This file is a publicly available 1980 Census product.

C. Methodology

All of the products for this contract are based upon the forth coming annual state population projections. These state projections use the cohort-component method but incorporate state variations in fertility and mortality as well as multi-regional techniques to project migration flows. The multi-regional approach uses state-to-state migration flows rather than the more common net migration, or gross in and out migration procedures.

1. Projection of Males aged 17 to 21 in Army Recruiting Battalions.

The post-1980 Census population of males aged X in a portion of a state in a specified battalion was assumed to be related to:

a. The 1980 population of that cohort of males in the state portion of the battalion;

b. The relationship between the number of males aged X in that state, and the size of that cohort in 1980 in that state;

c. The projected share of the total state population which was in the projected portion of the state in the specified battalion;

d. In 1980, the share of the total state population which was in that portion of the state in the specified battalion.

The final projected figures for each battalion were then derived by aggregation of the portions of several states in a specified battalion.

2. Projections of Hispanic Males by Type and Age for the 10 largest Hispanic States in 1980.

These projections were derived from the following relationships:

The future proportion of males aged 17 to 21 in the U.S. who are Hispanic;

The proportion of those cohorts of males in the U.S. who were Hispanic in 1980;

The proportion of those cohorts of Hispanic males by age and type of Hispanic in 1980 for each of the 10 states;

The projected total number of males in each state aged 17, 18, ... 21.

3. Projected Number of Males aged 17, 18, ... 21 in Puerto Rico.

These values were produced as an integral part of the forthcoming state population projections.

ARMY BATTALIONS

AS OF SEPTEMBER 1986

U.S. Bureau of the Census
February, 1987

I. WHITE NON-HISPANIC POPULATION TRENDS

Overview: This group of young American males will decrease more than any other race/ethnic population during the 1980 to 1995 period (Tables 1 to 5). It will decline by 2.5 million or 30 percent between 1980 and 1995 (Table 1). Thirty battalions will have at least 33 percent fewer Whites in 1995 than in 1980 (Table 1). The only battalions with more white males in 1995 than in 1985 are found in Florida and the Western slope of the Rockies from Montana to Arizona (Table 1). The White share of all young men will fall from 77 percent in 1980 to 71 percent in 1995 (Table 6A). The battalions with the largest proportions of White males are concentrated in the Snowbelt (Figure F, Table 6A).

1980 to 1985: The White population declined 1.1 million or more than 13 percent (Table 1). Only one battalion had more White males in 1985 than in 1980 (Figure K). This was 3C (West North Carolina). Thirty-nine of the 55 battalions declined by 10 percent or more (Table 1, Figure K). The areas which experienced the greatest losses are concentrated in Southern California, the Eastern Slope of the Rockies, South Texas, the Midwest, the area surrounding the Great Lakes, and the mid-Atlantic Seaboard (Figure K, Table 1).

1985 to 1990: The White population is projected to decline 600,000 or 8 percent (Table 1, Figure L). The battalions which will increase in size are found in Georgia, Florida, South Carolina, East Texas, and the Western Slope of the Rockies from Montana to Arizona (Figure L). Most of these are projected to grow less than 5 percent (Table 1). Twenty-four of the 55 battalions, on the other hand, are projected to decline by 10 percent or more (Table 1, Figure L). With the notable exceptions of Southern California and Louisiana; the areas with such declines are confined to the Midwest and the Northeast above the Potomac (Figure L). The battalions with the greatest proportions of White males are found in the Snowbelt (Figure F). Scarcely any such battalions exist in the Sunbelt states.

1990 to 1995: During this time the White population of battalions will fall by 750,000 or 11 percent (Table 1, Figure M). Only Battalion 6J will grow. Thirty-two battalions will lose 10 percent or more of their white males. These 32 battalions are found primarily in the Midwest and Northeast. Those which will experience even larger declines of more than 15 percent are found in the old Industrial Belt streching from Chicago to Boston (Figure M).

U.S. Bureau of the Census
February, 1987

II. MINORITY POPULATION TRENDS

Overview: While the U.S. population of White males aged 17 to 21 will decline about 2.5 million from 1980 to 1995 (Table 1), the comparable minority population will decline by less than 50,000 (Table 2). Twenty of the 55 battalions will have a larger minority population in 1995 than they had in 1980 (Table 2). The percentage of young men who are members of the minority group will climb from 23 percent in 1980 to 29 percent in 1995 (Table 6A). The battalions with a large percentage of minorities are concentrated in the Sunbelt, Alaska and Hawaii, Chicago, New York City, New Jersey, Maryland, and Delaware (Figure G).

1980 to 1985: The minority population of the U.S. declined less than 1 percent during this period. However, 15 battalions declined by more than 10 percent (Table 2, Figure N). These were typically battalions with small numbers of minority men, and were concentrated in New England, the lower Midest and the Northwest (Figure N). Eighteen battalions actually experienced growth in their minority population (Table 2, Figure N). Though scattered across the U.S., these battalions tend to be found in the Southwest, or along the Atlantic or Great Lakes borders (Figure N). Overall, only 8 battalions had a 1985 population of minorities which was more than 5,000 different from the 1980 level (Table 2).

1985 to 1990: Only one battalion (Virginia) is expected to lose more than 10 percent of its minority population during this period (Figure O). Aside from Alaska and Hawaii, the other battalions which will experience substantial declines are found east of the Mississippi (Figure O). Those battalions which will see their minority populations grow by more than 5 percent are concentrated in Texas, Minnesota and west of the Rockies (Figure O). Even with these changes, only 10 battalions will have a 1990 population of minorities which was more than 5,000 different from the 1985 level (Table 2).

1990 to 1995: At the U.S. level, the decline in the minority population is again trivial (Table 2). Only 9 battalions have a 1995 minority population which is 5,000 or more different from their 1990 levels (Table 2). However, Figure P clearly shows an area of the country where the minority population will fall by more than 10 percent. This area is within the region from Detroit south to Western North Carolina, and from New Jersey west to Kentucky. The areas with the greatest growth are south Florida, east Texas, and those battalions west of the Rockies (Figure P).

U.S. Bureau of the Census
February, 1987

III. BLACK POPULATION TRENDS

Overview: The Black population of recruitment-age males will decline by 251,000 or 18 percent between 1980 and 1995 (Table 3). Only South Florida will have more Blacks in 1995 than it had in 1980 (Table 3). Nine battalions will be at least a third smaller by 1995. These battalions are in Pennsylvania, West Virginia, Tennessee, Southwest Texas, New Mexico, Southern California, and the western side of the Rockies (Table 3). The percentage of recruitment-age men who are Black will still rise from 13 percent in 1980 to 15.4 percent in 1995 (Table 6B). This occurs because of the ever larger declines in the White population (Table 1). The areas with a high percentage of Blacks include Chicago, Detroit, and the entire Atlantic and Gulf Coast region from New York City around to Houston (Figure H). Blacks comprise a small portion of the population in the New England, West, Southwest, Mountain, and the Northern Great Plains states (Figure H). Blacks will be the largest minority in nearly every area east of the Mississippi except for Maine, eastern Pennsylvania, New York City and South Florida (Table 6B). West of the Mississippi, they are the largest minority only in Iowa, Oklahoma, Missouri, Louisiana, and North Texas (Table 6B).

1980 to 1985: The Black population declined 42,000 or 3 percent during this period (Table 3). Both the 15 battalions which gained in Black population and the 21 battalions which decreased more than 10 percent were scattered across the United States (Figure Q). No simple pattern of change was evident. Only 5 battalions (1G, 3I, 3J, 6F, and 6K) gained or lost more than 5,000 Black men in the 17 to 21 age group (Table 3).

1985 to 1990: The Black population will decline by 94,000 or 7 percent during this period (Table 3). Again, the 10 battalions which will gain in Black population and the 11 battalions which will decrease by more than 10 percent are scattered across the country (Figure R). Only 6 battalions will gain or lose more than 5,000 young Black men during this time (Table 3). These battalions are located in the New York City corridor and Los Angeles area (Battalions 1B, 1G, 1H, 1K, 3K, and 6F).

1990 to 1995: From 1990 to 1995, the young Black male population of the United States is projected to decline 116,000 or 9 percent (Table 3). Only the 4 battalions in Alaska and Hawaii, Washington state, Southern California, and Oklahoma are projected to grow by even modest amounts (Figure S, Table 3). Twenty-three battalions will lose 10 percent or more of their Black recruitment pool (Table 3). These are found in the Midwest and along the East Coast above the Potomac.

U.S. Bureau of the Census
February, 1987

IV. HISPANIC POPULATION TRENDS

Overview: The Hispanic population is the only race/ethnic group of young men in the United States to grow steadily from 1980 to 1995 (Table 4). It will grow by 173,000 or 21 percent during this time. Even so, 22 of the 55 battalions will contain fewer Hispanics in 1995 (Table 4). These battalions are generally found along the Eastern Great Lakes, and in the South, Southeast, and Midwest. None are in the Southwest or Western United States -- where most of the Hispanic growth is projected to occur (Table 4). The share of all young men who are Hispanic increases from 7.5 percent in 1980 to 12 percent by 1995 (Table 6B). Hispanics represent over 20 percent of the population of the battalions in California, Nevada, New Mexico, Arizona, Southwest Texas, and New York City (Figure I). Aside from the New York City, Chicago, and South Florida areas; Hispanics make up only a small share of the population east of the Mississippi (Figure I).

1980 to 1985: The Hispanic population of young men in the United States grew by 29,000 or 3.6 percent from 1980 to 1985 (Table 4). No simple pattern of change was evident in the geography of battalions which declined the most or grew the most. Only 9 battalions gained or lost more than 2,500 Hispanic males during this time (Table 4).

1985 to 1990: The population of young Hispanic males in the United States will grow 53,000 or 6.3 percent during this period (Table 4). Still, 12 of the 55 battalions will lose Hispanic males (Table 4). Aside from Alaska and Hawaii, these battalions tend to be scattered across the Eastern United States (Figure U). The battalions which will add to their Hispanic population will be much more numerous than they were in the 1980 to 1985 period, but these battalions are also scattered across the country. Seven battalions will gain more than 2,500 Hispanics (Table 4). These are found in Southern California, Arizona, Texas, and Chicago. No battalion will lose 2,500 Hispanics.

1990 to 1995: The population of young Hispanics in the United States is projected to grow by 90,000 or 10 percent. Ten battalions, however, will experience losses (Figure V). These are found in Michigan, the Appalachian region, and from Vermont to Maryland in the East. No simple pattern is evident for battalions which will experience the greatest percentage increases (Figure V). The 9 battalions which will add at least 2,500 Hispanics are found in California, Arizona, Texas, Florida, and Chicago (Table 4). No battalion will lose 2,500 Hispanics.

U.S. Bureau of the Census
February, 1987

V. OTHER RACES POPULATION TRENDS

Overview: The population of other races males of recruitment-age in the United States is very small (Tables 5 and 6B). The west is the only region containing battalions with more than 10,000 young males of other races (Table 5). However, between 1980 and 1995, this group will grow by 13%. By 1995, most battalions will show an increase in the numbers of young males of other races (Table 5). Among young males in 1980, the other races comprise only 2.2% of the population. By 1995, the percentage will increase to 3.3%. In the battalions located in Washington, Oklahoma, Arizona, Nevada, Southern California, Alaska and Hawaii, the other races population will comprise more than 5% of the total battalion population.

1980 to 1985: The other races population declined by 3.5 percent or 8,500 persons during this period. There was no regional patterns of growth or declines among the battalions (Figure W). Only 4 battalions lost or gained more than 1,000 persons.

1985 to 1990: The other races population is projected to grow 12 percent or 28,000 (Table 5). Only 2 battalions (Iowa, Alaska and Hawaii) are projected to lose population (Figure X). Those battalions which grew the most are concentrated in the eastern half of the United States plus Texas, Southern California, and the Pacific Northwest. Twelve battalions will gain more than 1,000 other Races males -- only Alaska and Hawaii lose that many.

1990 to 1995: The population of young other races males will grow by 12,000 or 4.6 percent. However, fifteen battalions will lose population. These battalions are scattered across the United States. Only 3 battalions will grow by more than 1,000 persons. These battalions are located in the west. No battalions will decline by 1,000 persons.

TABLE 1. ARMY BATTALIONS - WHITE NON-HISPANIC POPULATION TRENDS FROM 1980 TO 1995

(Population of males aged 17 to 21)

Methodology and Data Sets

A. Data Sets

The following data sets were used in the construction of the projections.

1. National-level

   a. Hispanic males aged 17, 18, 19, 20, and 21 as a proportion of all such U.S. males for July 1, 1981 to July 1, 1995. The Hispanic data are from Series P-25, No. 995, and the total U.S. data are from the Bureau's current estimates and projections (Series P-25, No. 952; and No. 985).

   b. Hispanic males aged 0, 1,..., 21 as a proportion of all such U.S. males for April 1, 1980. These statistics are from the modified race-modified Spanish Origin 1980 Census file. They are not published.

2. State-Level

   a. Population projections for Total, White, Black, and other race males aged 17, 18, 19, 20, 21 for 1981 to 1995. Each state's total population for 1981 to 1988 was also used. These state projections are consistent with the state estimates for 1985. They will not be published by the Census bureau until Fall, 1987. These projections use the most sophisticated demographic methods available. Questions about them should be directed to Signe Wetrogan on 301-763-5964.

3. County-Level

   a. Estimates and projections for males aged 17, 18, 19, 20, and 21 (and total 17 to 21) for each battalion in the United States for July 1, 1981 to July 1, 1995. These are the product provided ARI in November, 1986.

   b. Males aged 0, 1,..., 21 by modified race and modified Spanish-origin for each U.S. county on April 1, 1980. This file is not published.

B. Methodology

All of the products for this contract are based upon the forthcoming annual state population projections. These state projections use the cohort-component method but incorporate state variations in fertility and mortality as well as multi-regional techniques to project migration flows. The multi-regional approach uses state-to-state migration flows rather than the more common net migration, or gross in and out migration procedures.

The post-1980 Census population of males with race/ethnicity Y who are aged X in a portion of a state in a specified battalion was assumed to be related to:

a. The 1980 population of that cohort of males in the state portion of the battalion;

b. The relationship between the number of males aged X with race Y in that state, and the total size of that cohort in 1980 in that state;

c. The projected share of the total state population which was in the projected portion of the state in the specified battalion;

d. In 1980, the share of the total state population which was in that portion of the state in the specified battalion.

e. The relationship between the number of males aged X with race Y in the state in 1980; and the size of group Y at age X + N in year 1980 + N in the state.

f. The relationship between the number of Hispanic males aged X in the U.S. in 1980; and the size of that group at age X + N in year 1980 + N in the U.S.

The final projected figures for each battalion were then derived by aggregation of the portions of several states in a specified battalion. The 1980 race/ethnic data enabled us to generate Non-Hispanic White, Black, and other races as distinct groups from the Hispanic population. From 1981 to 1995, the Non-Hispanic groups were assumed to follow the patterns of all members of a race--whether Hispanic or not.

TEXT TABLES

1. Army brigages - race/Hispanic trends: April 1, 1980 and July 1, 1987 to 2000
2. Army brigages - race/Hispanic composition: April 1, 1980 and July 1, 1987 to 2000
3. Army brigages - Percent of the U.S. population in army brigages - race/Hispanic: April 1, 1980 and July 1,1987 to 2000
4. Army battalions - all races population trends: April 1, 1980 and July 1, 1987 to 2000
5. Army battalions - White non-Hispanic population trends: April 1, 1980 and July 1, 1987 to 2000
6. Army battalions - Minority population trends: April 1, 1980 and July 1, 1987 to 2000
7. Army battalions - Black non-Hispanic population trends: April 1, 1980 and July 1, 1987 to 2000
8. Army battalions - Hispanic population trends: April 1, 1980 and July 1, 1987 to 2000
9. Army battalions - other races non-Hispanic population trends: April 1, 1980 and July 1, 1987 to 2000

10A. Army battalions - race/Hispanic composition: April 1, 1980 and July 1, 1987 to 2000 - (Percent White non-Hispanic, Percent Minority)

10B. Army battalions - race/Hispanic composition: April 1, 1980 and July 1, 1987 to 2000 - (Percent Black non-Hispanic, Percent Hispanic, Percent other races non-Hispanic)

11. Army battalions - Percent of the U.S. population in army battalions - race/Hispanic: April 1, 1980 and July 1, 1987 to 2000

12. U.S. counties with a population of 100,000 and over - all races population trends: April 1, 1980 and July 1, 1987 to 2000
13. U.S. counties with a population of 100,000 and over - White non-Hispanic population trends: April 1, 1980 and July 1, 1987 to 2000
14. U.S. counties with a population of 100,000 and over - Minority population trends: April 1, 1980 and July 1, 1987 to 2000
15. U.S. counties with a population of 100,000 and over - Black non-Hispanic population trends: April 1, 1980 and July 1, 1987 to 2000
16. U.S. counties with a population of 100,000 and over - Hispanic population trends: April 1, 1980 and July 1, 1987 to 2000
17. U.S. counties with a population of 100,000 and over - other races non-Hispanic population trends: April 1, 1980 and July 1, 1987 to 2000

18a. U.S. counties with a population of 100,000 and over - Race/Hispanic composition: April 1, 1980 and July 1, 1987 to 2000 (Percent White non-Hispanic, Percent Minority, Percent Black non-Hispanic)

18b. U.S. counties with a population of 100,000 and over - Race/Hispanic composition: April 1, 1980 and July 1, 1987 to 2000 (Percent Hispanic, Percent other races non-Hispanic)

DETAILED TABLES

Appendix

1. Battalion population of males by race/Hispanic for each age 17 to 21: 1980 and each year 1987 to 2000
2. Population of males aged 17 to 21 for all counties: 1980 and each year 1987 to 2000

U.S. Bureau of the Census
February 1988

I. TOTAL POPULATION TRENDS

Young American males aged 17 to 21 will increase by 100,000 between 1987 and 2000. This is a sharp contrast to the decline of 1.5 million their group experienced from 1980 to 1987.

Only one battalion increased between 1980 and 1987.

In the immediate future, however (between 1987 to 1990) two-thirds of the battalions are projected to decline.

Between 1987 to 1990 battalions with the greatest declines will be concentrated in the Midwest and the Northeast above the Potomac.

After 1987 battalions with the greatest increase will be mostly in the West.

In 2000, the largest battalions will be mostly scattered throughout the Sunbelt and Mid-Atlantic coastal states.

U.S. Bureau of the Census
February 1988

TOTAL POPULATION TRENDS

Overview: The number of young American males will increase by nearly 100,000 between 1987 and 2000 (Table 1). Most of the rapid decline occurred in the past 7 years. Half of the 55 battalions will have fewer persons in 2000 than in 1987 (Table 4). The fastest growing battalions -- those with more males in 2000 than in 1980 -- will be mostly in the Sunbelt states (Table 4, Figures Z, AA and BB). In 1987 the largest battalions are in California, Texas, Florida and scattered along the Northeast coast (Figure D). By 2000, battalions with the greatest number of males are mostly scattered throughout the Sunbelt, Mid-Atlantic coastal states, and California (Figure E).

1980 to 1987: The total population declined 1.5 million or more than 14 percent (Table 1). Only one battalion had more males in 1987 than in 1980 (Table 4). This was 3E (South Georgia and North Florida). Nearly two-thirds of the 55 battalions declined by 13 percent or more (Table 4, Figure Z). The areas which experienced the greatest losses are concentrated in the Midwest and the area surrounding the Great Lakes (Figure Z, Table 4).

1987 to 1990: The total population is projected to decline 160,000 or 1.8 percent (Table 1, Figure AA). Only one-third of the battalions will increase. These are found in the Sunbelt east of the Mississippi River, California, Texas, and the Western Slope of the Rockies from Montana to Arizona (Figure AA). Two-thirds of the 55 battalions, on the other hand, are projected to decline (Table 4, Figure AA). The areas with the greatest declines are concentrated in the Midwest and the Northeast above the Potomac (Figure AA).

1990 to 2000: During this time the total population of battalions will grow by 260,000 or 3 percent (Table 1, Figure AB). More than half of the battalions will grow. Twenty-six battalions will experience population declines. These battalions are found primarily in the Midwest and Northeast. Those which will experience the largest declines of more than 7 percent are found in the Northeast clustered around the Great Lakes (Figure AB). The battalions showing the greatest increases are clustered in the West and Southwest regions plus Georgia and Florida.

U.S. Bureau of the Census
February 1988

II. WHITE NON-HISPANIC POPULATION TRENDS

Most of the declines among young males of all races during 1980 to 2000 will be due to the rapid decline in the number of young white males.

Young White males aged 17 to 21 will decline by 400,000 between 1987 and 2000. This follows a decline of 1.5 million or 18 percent between 1980 and 1987.

Thirteen battalions will experience declines of 20,000 or more during the 1987 to 2000 period.

In the immediate future (between 1987 and 1990), young White males in more than a third of the battalions will decline by 5 percent.

In the future (between 1990 and 2000) the White population of battalions will decrease by 160,000 or 3 percent.

The greatest declines in the future will occur in the Northeast.

The most rapid increases in the distant future (after 1990) will occur in the West.

The battalions with the largest proportions of White males are concentrated in the Snowbelt.

U.S. Bureau of the Census
February 1988

WHITE NON-HISPANIC POPULATION TRENDS

Overview: These young males will be the only group which is smaller in 2000 than it was in 1987 (Tables 1). It will decline by 418,000 or 6 percent between 1987 and 2000 (Table 1). Thirty-four battalions will have at least 20 percent fewer Whites in 2000 than in 1980 (Table 5). The only battalions with more White males in 2000 than in 1980 are found in Florida, Georgia and Texas (Table 5). The White share of all young men will fall from 74 percent in 1987 to 68 percent in 2000 (Table 10A). The battalions with the largest proportions of White males are concentrated in the upper Midwest and along the Appalachian Mountains (Figures P and Q, Table 10A).

1980 to 1987: The White population declined 1.5 million or more than 18 percent (Table 5). No battalions had more White males in 1987 than in 1980 (Figure AC). Thirty-six of the 55 battalions declined by 17 percent or more (Table 5, Figure AC). The areas which experienced the greatest losses are concentrated in Southern California, the Eastern Slope of the Rockies, New Mexico, Southwest Texas, the Midwest, and the area surrounding the Great Lakes (Figure AC, Table 5).

1987 to 1990: The White population is projected to decline 250,000 or 4 percent (Table 5, Figure AD). The battalions which will increase in size are found in Georgia, North Florida, the Carolinas, Southeast Texas, and the Western Slope of the Rockies from Montana to Arizona (Figure AD). All of these are projected to grow less than 6 percent (Table 5). Nineteen of the 55 battalions, on the other hand, are projected to decline by more than 6 percent (Table 5, Figure AD). With the notable exceptions of Southern California, New Mexico and West Texas; the areas with such declines are confined to the Midwest and the Northeast above the Potomac (Figure AD). The battalions with the greatest proportions of White males are found in the upper Midwest and along the Appalachian Mountains (Figure P). Scarcely any such battalions exist in the Sunbelt states.

1990 to 2000: During this time the White population of battalions will fall by 160,000 or 2.6 percent (Table 1, Figure AE). Twenty-two battalions will lose 5 percent or more of their white males. These battalions are found primarily in the Midwest and Northeast. Ten battalions will experience population gains of 5 percent or more. They are found in Northeast Texas, Georgia and North Florida, Alaska and Hawaii, and the Western Slope of the Rockies from Montana to Arizona (Figure AE).

U.S. Bureau of the Census
February 1988

III. MINORITY POPULATION TRENDS

The minority population will increase by a half million (or 22 percent) between 1987 and 2000.

Fourteen battalions will increase by 10,000 or more during the 1987 to 2000 period.

In the past (between 1980 and 1987) the minority population of the U.S. increased less than 1 percent.

Most of the battalions that will lose minority population are location east of the Mississippi.

Between 1990 and 2000 the minority population of battalions in the Rockies (extending from California to South Texas) will grow by 25 percent or more.

Battalions which will continue to have the largest minority populations are located mostly in the Sunbelt or scattered along the Mid-Atlantic Coast.

U.S. Bureau of the Census
February 1988

MINORITY POPULATION TRENDS

Overview: While the U.S. population of White males aged 17 to 21 will decline about 1.9 million from 1980 to 2000, the comparable minority population will increase by 530,000 (Table 1). Forty-three of the 55 battalions will have a larger minority population in 2000 than they had in 1980 (Table 6). The percentage of young men who are members of the minority group will climb from 22 percent in 1980 to 32 percent in 2000 (Table 10A). The battalions with a large percentage of minorities are concentrated along the Mid-Atlantic Seaboard, in the Sunbelt, Alaska and Hawaii, and Chicago (Figures R and S).

1980 to 1987: The minority population of the U.S. increased less than 1 percent during this period. However, 11 battalions declined by more than 9 percent (Table 6, Figure AF). These were typically battalions concentrated to the east of the Mississippi River. Thirty battalions actually experienced growth in their minority population (Table 6, Figure AF). Though scattered across the U.S., these battalions tended to be found in the Northwest, Southwest, in New England and Florida or along the Great Lakes borders (Figure AF). Overall, only 4 battalions had a 1987 population of minorities which was more than 5,000 different from the 1980 level (Table 6).

1987 to 1990: Only 13 battalion are expected to lose a proportion of its minority population during this period (Figure AG). Aside from Arkansas and Louisiana, the other battalions which will experience declines are found in New England and the Mid-Atlantic states (Figure AG). Those battalions which will see their minority populations grow by more than 5 percent are concentrated in Maine, the Northwest, Southwest, and scattered in the East North Central and South Atlantic states from Michigan to North Florida (Figure AG). Even with these changes, only 6 battalions will have a 1990 population of minorities which was more than 5,000 different from the 1987 level (Table 6).

1990 to 2000: The number of battalions that decline in the minority population is again trivial (Table 6). Only 3 battalions have a 2000 minority population which is less than their 1990 levels (Table 6). However, Figure AH clearly shows an area of the country in which minority population will increase by more than 9 percent. This area which includes most of the region west of the Mississippi River and in Maine, Georgia, Florida, Virginia, and Delaware consists of three-fifths of all battalions (Figure AH).

U.S. Bureau of the Census
February 1988

IV. BLACK NON-HISPANIC POPULATION TRENDS

The Black population of recruitment-age males will grow by 11 percent (132,000) between 1987 and 2000.

Nine battalions will account for 76,000 of the total growth of 132,000 from 1987 to 2000.

Young Black men declined by 100,000 or 8 percent during the 1980 to 1987 period.

The trend of decline during the early 1980's will reverse in the immediate future, as the number of young Black males will increase by 16,000 or 1 percent between 1987 and 1990.

During the 1990 to 2000 period most of the rapid growth will occur west of the Mississippi.

The battalions with the largest proportions of Black males are concentrated in the Southeast and scattered throughout the Northeast.

U.S. Bureau of the Census
February 1988

BLACK NON-HISPANIC POPULATION TRENDS

Overview: The Black population of recruitment-age males will rise 132,000 between 1987 and 2000 (Table 7). By 2000, only half of the battalions will have population gains over the 1980 level. The percentage of recruitment-age men who are Black will still rise from 13 percent in 1980 to 15 percent in 2000 (Table 10B). This occurs because of the large declines in the White population (Table 1). The areas with a high percentage of Blacks include Chicago, Detroit, and the entire Atlantic and Gulf Coast region from New York City around to Houston (Figures T and U). Blacks comprise a small portion of the population in the New England, West, Southwest, Mountain, and the Northern Great Plains states (Figures T and U). Blacks will be the largest minority in nearly every area east of the Mississippi except for Maine, Eastern Pennsylvania, New York City and South Florida (Table 10B). West of the Mississippi, they are the largest minority only in Iowa, most of the West, and the North Central states as far south as North Texas (Table 10B).

1980 to 1987: The Black population declined 100,000 or 8 percent during this period (Table 7). Only 6 battalions (6H, 1N, 1K, 5B, 3I, and 1G) lost more than 5,000 Black men in the 17 to 21 age group (Table 7), while no battalion gained more than 2,000. The 8 battalions which gained in Black population were located in Massachusetts, Connecticut, Florida, New York City and around the Great Lakes. Twenty-two battalions which decreased 11 percent or more were mostly located West of the Rockies, in the Appalachian Mountains from West Virginia around to the west of the Ozark Plateau, in Maine, Alaska and Hawaii (Figure AI).

1987 to 1990: The Black population will increase by 16,000 or 1 percent during this period (Table 7). Only 7 battalions will gain or lose more than 2,000 young Black men during this time (battalions 1C, 1E, 6H, 5A, 1F, 3J, and 5B; Table 7). Eleven battalions which will have the greatest gains in Black population are located in the Southwest, Michigan, Alaska, Hawaii, and Tennessee, while the 11 with the greatest losses are in the Northeast (Figure AJ).

1990 to 2000: From 1990 to 2000, the young Black male population of the United States is projected to increase 116,000 or 10 percent (Table 1). All except 5 battalions will increase in population during this period. Most of the rapid growth will be concentrated west of the Mississippi River, and in Florida, Georgia, Maryland, Delaware, and Maine. Population losses or slow growth will be mostly among the West Appalachian and Great Lakes states. Only 9 battalions will gain more than 5,000 Black men in the 17 to 21 age group (Table 7).

U.S. Bureau of the Census
February 1988

V. HISPANIC POPULATION TRENDS

Young Hispanic males will grow by 231,000 or 28 percent during the 1987 to 2000 period.

Eleven battalions will account for nearly 90 percent of the growth during the 1987-2000 period.

The share of all young men who are Hispanic will increase from 8 percent in 1980 to 12 percent by 2000.

These young males will grow 42,000 or 5 percent between 1987 and 1990.

Between 1990 and 2000 the Hispanic population will rapidly increase by 189,000 or 22 percent.

During the 1990 to 2000 period most of the rapid growth will occur west of the Mississippi and along the Atlantic and Gulf Coast from Delaware to Alabama.

Most of the battalions with the largest proportions of Hispanics are located in the Southwest.

U.S. Bureau of the Census
February 1988

HISPANIC POPULATION TRENDS

Overview: The Hispanic population of young men in the United States will grow steadily from 1980 to 2000 (Table 1). It will grow by 270,000 or 35 percent during this time. Only 6 of the 55 battalions will contain fewer Hispanics in 2000 (Table 8). Most of the Hispanic growth is projected to occur in the Southwest or Western United States (Table 8). The share of all young men who are Hispanic increases from 7.5 percent in 1980 to 12 percent by 2000 (Table 10B). In 1987, Hispanics represent over 14 percent of the population of the battalions in California, Nevada, Colorado, New Mexico, Arizona, Southwest Texas, and New York City (Figure V). By 2000, Hispanics in these battalions (with the exception of Colorado) will represent over 20 percent of population in these areas (Table W). Aside from the New York City, Chicago, and South Florida areas; Hispanics make up only a small share of the population east of the Mississippi (Figure V).

1980 to 1987: The Hispanic population of young men in the United States grew by 43,000 or 5.6 percent from 1980 to 1987 (Table 1). The 9 battalions that will decline by more than 5 percent during this period are in the Midwest. The 10 battalions that will increase by more than 10 percent are in South Texas, Arizona and Coastal states from Virginia around to Alabama (Figure AL). Only 9 battalions gained more than 2,500 Hispanic males during this time (Table 8).

1987 to 1990: The population of young Hispanic males in the United States will grow 42,000 or 5.2 percent during this period (Table 1). Still, 15 of the 55 battalions will lose Hispanic males (Table 8). These battalions tend to be scattered across the Snowbelt in the Northeast (Figure AM). Only 8 battalions will add more than 10 percent to the Hispanic population in the 1987 to 1990 period, but these battalions are also scattered across the country. Eight battalions will gain more than 2,500 Hispanics (Table 8). These are found in the Northwest Rockies, South Texas, the Carolina's and Georgia. No battalion will lose 2,500 Hispanics.

1990 to 2000: The population of young Hispanics in the United States is projected to grow by 189,000 or 22 percent. Three battalions, however, will experience losses (Table 1). Those with losses or the least amount of increase are found in the Northeast. Most battalions which will experience the greatest percentage increases are in Virginia, Florida, the Rockies extending from California to South Texas (Figure AN). The 14 battalions which will add more than 2,500 Hispanics are scattered throughout the United States (Table 8). No battalion will lose 2,500 Hispanics.

U.S. Bureau of the Census
February 1988

VI. OTHER RACES NON-HISPANIC POPULATION TRENDS

The population of other races males of recruitment-age is very small; however it will grow by 50 percent (150,000) between 1987 and 2000. Its absolute growth will be greater than that of Blacks, even though they are currently only one-quarter the size of the Black population.

Just 6 battalions will account for nearly half of the growth during the 1987 to 2000 period.

Among all young men the other races will increase from 2 percent of the total in 1980 to 5 percent by 2000.

In the past (between 1980 and 1987), the other races population increased by 70,000 or 31 percent.

In the future no battalion will lose population.

Battalions that grew rapidly are mostly located in the Eastern half of the U.S. plus Texas, California, and Wisconsin during the 1987 and 1990 period.

U.S. Bureau of the Census
February 1988

OTHER RACES NON-HISPANIC POPULATION TRENDS

Overview: The population of other races males of recruitment-age in the United States is very small (Tables 1 and 10B). The region west of the Mississippi River and scattered along the Atlanta seaboard from Boston to Raleigh contain battalions with more than 4,000 young males of other races (Table 9 and Figure N). Between 1980 and 2000, this group will grow by 97 percent with all battalions showing an increase in the numbers of young males of other races (Table 9). Among all young males in 1980, the other races comprise only 2.2 percent of the population. By 2000, the percentage will increase to 5.1 percent. In all the battalions located in the west, the other races population will comprise more than 6 percent of the total battalion population.

1980 to 1987: The other races population increased by 31 percent or 70,000 persons during this period (Table 9). Twenty-two battalions gained more than 1,000 persons. However, the greatest percentage change occurred in Wisconsin, Georgia, Florida, Southeast Texas, and the Mid-Atlantic coastal states from Massachusetts to Virginia.

1987 to 1990: The other races population is projected to grow 11.5 percent or 34,000 (Table 1). No battalion is projected to lose population (Figure AP). Those battalions that will have the largest percentage change are concentrated in the Eastern half of the United States plus Texas, California, and Wisconsin. Seven battalions will gain more than 1,000 other races males.

1990 to 2000: The population of young other races males will grow by 120,000 or 35.5 percent. No battalion will lose population. More than half of the battalions will grow by more than 1,000 persons. These battalions are scattered across the United States.

U.S. Bureau of the Census
February 1988

Methodology and Data Sets

A. Data Sets

The following data sets were used in the construction of the projections.

1. National-level

   a. Hispanic males 17, 18, 19, 20, and 21 as a proportion of all such U.S. males for April 1, 1980. These statistics are from the modified race-modified Spanish Origin 1980 Census file. They are not published.

   b. Hispanic males aged 17, 18, 19, 20, and 21 as a proportion of all such U.S. males for July 1, 1987 to July 1, 2000. The Hispanic data are from Series P-25, No. 995, and the total U.S. data are from Series P-25, No. 952.

2. State-Level

   a. Population projections for total, White, Black, and other race males aged 17, 18, 19, 20, and 21 for 1987 to 2000 were also used. These projections are consistent with the state estimates for July 1, 1986 and the projections of the population of states in Series P-25, No. 1017 (forthcoming).

3. County-Level

   a. All males aged 17, 18, 19, 20, and 21 by modified race and modified Spanish-origin for each U.S. county on April 1, 1980. This file is not published.

   b. The total population for each U.S. county on April 1, 1980 and July 1, 1986 was used. These data are not published.

   c. The institutional population for males aged 17, 18, 19, 20, and 21 by race/ethnicity for each U.S. county on April 1, 1980 was used. The detailed tabulation of these data was done for this project and is not published in detail.

B. Methodology

This report contains population projections of the United States (a) army battalions and counties over 100,000 population for males aged 17 to 21 by race/ethnicity for April 1, 1980 and July 1, 1987 to July 1, 2000; and (b) counties for males in the age group 17 to 21 for April 1, 1980 and July 1, 1987 to July 1, 2000 using the primary set of information identified above. Figures are for the noninstitutional population and excludes those in the military and institutions (i.e., juvenile institutions, prisons, nursing homes, and physical and mental hospitals, etc.). Although the age, race/ethnic detail was projected at the county level, for the majority of counties, the data are not robust enough to permit detailed classifications and have been aggregated to larger levels of geography (i.e. battalions) or larger demographic groups. The detailed age and race/ethnic county figures for males projected from July 1, 1987 to 2000 were obtained as follows:

1. As a first step, detailed annual projections of the population of states by single years of age, sex and race were prepared. These projections are prepared using the cohort component method whereby each component of population change - births, deaths, domestic in-migration, domestic out-migration and net immigration from abroad are projected separately for each birth cohort. The method also allows for the aging over time of the differential size of cohorts. Although this basic framework is the same as in past projections, these projections represent a major advance in our state population projections methodology. The major innovations include:

a. The projection of annual population by single years of age instead of the projections by five-year age groups for every fifth year.
b. The use of state-to-state migration flows rather than net migration, or gross in-and out-migration.
c. The tying of migration projections to administrative data to provide more recent information as well as the possibility of updating the migration data during the intercensal period.
d. A time series analysis of recent annual trends in migration streams to add a dynamic element to our migration projections, rather than the past practice of holding migration rates constant.
e. The use of state differentials in survival rates based on the 1980 decennial life tables.
f. The use of state differentials in the timing patterns of fertility.

The cohort-component method is based on the traditional demographic accounting system:

$$P_1 = P_0 + B - D + DIM - DOM + IIM - IOM$$

where:
P_1 = population at the end of the period
P_0 = population at the beginning of the period
B = births during the period
D = deaths during the period
DIM = domestic in-migration during the period
DOM = domestic out-migration during the period
IIM = international in-migration during the period
IOM - international out-migration during the period

In order to generate population projections with this model, we need separate data for each of these components. The assumptions and procedures by which these data are generated by single year of age, sex, and race are described in an appendix to this report. In general, the assumptions concerning the future levels of fertility, mortality, and net immigration are consistent with the assumptions developed for the national population projections to be published in Current Population Reports, Series P-25, No. 1018.

Once the data for each of the components have been developed, it is a relatively straightforward process to apply the cohort-component method and produce the projections. For each projection year, the base population for each state is disaggregated into the 3 racial categories - White, Black, Other Races - by sex and single years of age, age 0 to 85 and over. The next step is to survive each age-sex-race group forward 1 year using the pertinent survival rate. The internal redistribution of the population is accomplished by applying the appropriate state-to-state migration rate to the survived population in each state. The appropriate number of immigrants from abroad is then added to each group. The population under age 1 is then created by applying the appropriate age-specific birth rates to the females of childbearing age. The number of births by sex and race are survived forward and exposed to the appropriate migration rates to yield the population under age 1. As a last step, the final results of the projection process are adjusted to be consistent with the national population projections by single years of age, sex and race. The entire process is then repeated for each year of the projection cycle. A more complete discussion of each of the components is included in the appendix to this report.

2. The next step in the process involved the disaggregation of the projections of the male population aged 17 to 21 by race in each state to the county level. This disaggregation was accomplished by examining the historical proportions of the state male populations aged 17, 18, 19, 20, and 21 by race in each county. These historical proportions were projected into the future using the most recent trends in county population change.

3. Preliminary projections of the male population aged 17,

18, 19, 20, and 21 by race for each county for each year 1987 to 2000 were obtained by applying the projected proportions to the appropriate age,race cohort in the state projections.

4. The preliminary county figures for each state were aggregated and compared to the state projections. Final county projections for males aged 17 to 21 by race were obtained by weighting the preliminary county figures for each state to the corresponding state projections.

5. The male Hispanic and Non-Hispanic county projections by age were derived for each race using (a) Hispanic males aged 17, 18, 19, 20, and 21, by race as a proportion of all such males by race and age in each county for April 1, 1980; (b) the projected change in Hispanic males aged 17, 18, 19, 20, and 21, by race as a proportion of all such males in the U.S. from 1980 to each year 1987 to 2000; and (c) the final county projections for males aged 17 to 21 by race (obtained in Step 4). The projected changes in the U.S. proportions from 1980 to each year 1987 to 2000 (Item b) were applied to the initial proportions in each county (Item a) to yield a projected proportion in each county. This projected proportion Hispanic by race was applied to the final county projection of males aged 17 to 21 by race (Item c) to yield the male population aged 17 to 21 by race/Hispanic for each county.

6. As a final step, the numbers of males aged 17 to 21 by race/Hispanic in the military and institutions on April 1, 1980 were subtracted from the projected county figures.

7. The projected figures for each battalion were derived by aggregation of the appropriate counties. Although the age and race/Hispanic detail was projected at the county level; for the majority of counties, these data are not robust enough to show separately and are aggregated to the battalion level or to larger demographic groups.

C. Additional Notes

1. The projected figures for each battalion were derived by aggregation of specified counties. Although these projections incorporate battalion changes (i.e., Arthur, Chase, Dundy, Grant, Hayes, Keith, Perkins, and Red Willow counties in Nebraska were dropped from battalion 4D and added to 5L; while Morrow and Umatilla counties in Oregon were dropped from 6H and added to 6L as of October 1987), the maps in the report do not reflect these changes.

2. The projected figures for each brigade were derived by aggregation of specific battalions. For example, the northeast brigade refers to battalions 1A to 1N; the southeast brigade

refers to battalions 3A to 3K; the southwest brigade refers to battalions 4A to 4K, and 5N; the mideast brigade refers to battalions 5A to 5M; and the west brigade refers to battalions 6A to 6L. It should be noted that battalion 5N was changed to 4N, however the information was not received in time to incorporate this change in the battalion tables or maps.

3. This report updates the February 1987 report "Projections of the Military Origin 1980 to 1995." The difference between the earlier and current reports are (1) methodology used to prepare the projections, (2) the incorporation more recent data, (3) the projections have been extended to the year 2000, and (4) males in military barracks and institutions have been excluded.

Appendix to Methodology

This section includes a more complete discussion of the assumptions used to generate each of the components of population change in the annual projections of population by single years of age, sex and race for all states.

Base Population

The beginning population of these projections is the estimate of the July 1, 1986 resident population of states by sex and single years of age as published in Current Population Reports, Series P-25, No. 1010. However, in order to begin the projection system, the base population of each state needed to be further disaggregated into the three racial categories. Such detailed information is only available for April 1, 1980. Because of differences in the reporting of race between the 1980 census and other sources of administrative data such as births and deaths, the census counts were modified to be consistent with the Office of Management and Budget categories. (See Jeffrey S. Passel, "Procedures for Producing Preliminary OMB-Consistent Modified Race Data from the 1980 Census by Age, Sex, and Hispanic Origin for States and Counties," Bureau of the Census, 1983, unpublished.)

In order to generate the detailed information for each state on July 1, 1986, the modified census counts are projected forward to each July 1 date 1981 to 1986, using the appropriate mortality, fertility, immigration and state-to-state migration rates. For July 1, 1986, the initial sets of state data were further adjusted to be consistent with both the July 1, 1986 estimates of the resident population of states by sex and single years of age and the July 1, 1986 estimates of the resident population of the United States by sex, race, and single years of age. (Current Population Reports, Series, P-25, No. 1000 and No.1010).

The population data for each state shown in this report are for the resident population of each state. They include the members of the Armed Forces where they reside at their duty station. Because of the marked differences in migration behavior exhibited by persons in the military, the projection of the military population is handled separately. Prior to the first step in the projection cycle, the military population in each state by sex, race, and single years of age is subtracted from the resident population. After the application of the appropriate mortality, fertility, net immigration and state-to-state migration rates, the military population is added back to the state population. For these projections, the estimates of the military population in each state are assumed to remain constant at levels estimated using July 1, 1985 estimates of the military population.

Mortality:

The assumptions about future levels of mortality used in these projections are consistent with the revised middle series mortality assumptions used in the national population projections

(See Current Population Reports, Series P-25, No. 1018 for a complete discussion of the methodology used to develop these assumptions.) . In general these projections assume a slight increase in overall life expectancy from 75.0 in 1986 to 77.6 in 2005 and 81.2 in 2080. The national level projections provide us with annual projections of the survival rates by single years of age, sex and race for each projection year 1986 through 2080. However, in order to prepare the projections at the state level, we must make an additional assumption relating to state differences in mortality. In recent projections, we made no distinction among states in their survival rates and used the national survival rates for all states. However with the increasing importance of projections of the elderly population, and the availability of decennial life tables by state, we re-examined the validity of this assumption. For 1970 and 1980, we found considerable variation among states in the life expectancies. This variation was also present within the various sex-race groups.

Given these findings, for this set of projections, we decided to use state life tables to incorporate existing state differentials into the mortality assumptions. Additionally, we are making the assumption that throughout the projection period, the existing patterns of state differentials in mortality remain unchanged.

To begin our projections of survival rates, we utilized the 1979-1981 state life tables developed by the National Center for Health Statistics (NCHS) to develop state survival rates for 1980 by single years of age, sex and race. State life tables for the White population were available for all states. However, for many states, NCHS had not developed life tables for the Black population. For those states where a life table for the Black population was available, we used the data to calculate survival rates by single years of age and sex for the Black population in 1980. For the remainder of the states, we developed the survival rates by age and sex for the Black population by applying the state differentials in the survival rates for the White population to the U.S. survival rates in 1980 developed for the Black population.

Once these initial sets of survival rates by single years of age, sex and race were developed for each of the states we had to bring them forward to 1986 and then project to each year 1987 to 2010. To bring the state rates forward to 1986, we applied the national change in survival rates by single years of age, sex, and race from 1980 to 1986 to the initial state rates. To project the rates forward, applying the assumption that the state differentials remain constant, we applied the projected annual change in the U.S. survival rates by single years of age, sex and race for each year 1987 to 2010, to each set of state rates. (See P-25, No. 1018 for the projected trends in U.S. survival rates)

The National Center for Health Statistics does not prepare separate life tables for race groups other than White and Black. There are no national level projections of survival rates for the "Other Races" population. Since we did not have sufficient data

to make any separate assumptions for this race group, we are applying the state survival rates for the White population to the Other Races population. This is the same assumption that was used in the national projections.

International Immigration:

For this set of state population projections, we are projecting separately the foreign and domestic migration components. In general, the overall levels as well as the age, sex and race distribution of net immigration are consistent with the levels and distributions used in the current set of national projections. These projections assume a decreasing level of net immigration from an annual level of 600,000 through 1988 linearly decreasing to 500,000 by 1998 and remaining at that level for the remainder of the projection cycle. This annual net immigration assumption is composed of approximately 160,000 emigrants, and 760,000 decreasing to 660,000 immigrants. Included in the immigration category is an assumed level of 200,000 undocumented immigrants decreasing to an annual level of 100,000. The age, sex, and race distribution of the net immigration component is based on the most recent characteristics of each of the net immigration components. Once these overall levels and age, sex and race distribution of the net immigration component are determined, the next step involves distributing the component to each of the states. For distribution to the states, we separated the net immigration component into each of the following categories: immigration, emigration, and the separate flows of migrants between each state and Puerto Rico.

Emigration: For the first time in our projection system, rates of emigration are applied to the base population of each state to develop the number of emigrants leaving each state. The emigration rates are based on the assumption used in the national level projections of 160,000 emigrants leaving the U.S. each year. In order to compute the rates for each state, the distribution of 160,000 emigrants by age, sex, and race is alloted to states on the basis of the 1980 residence of the foreign born population. Using this result as the numerator and the 1980 population of each state as the denominator, we calculated the rates of emigration from each state. Although we are assuming that the rates of emigration remain constant throughout the projection period, the number of emigrants from each state and the total numbers from the United States change throughout the projection period due to the projected changes in the base population of each state.

Flows Between U.S. and Puerto Rico: Another portion of the overall net immigration component is the flow of persons between each state and Puerto Rico. For these projections, these flows are projected using sets of state-to-Puerto Rico and Puerto Rico-to -state migration rates. To develop the migration rates between each state and Puerto Rico, we utilized the decennial census data on residence 5 years ago for each state and Puerto Rico. Since the decennial data are for a 5-year migration interval, the first

step was to convert the migration data to a 1-year migration interval. By making the simplifying assumption that there is no return or repeat migration, we can obtain an annual migration flow by dividing each 5-year flow by five. Using this result as the numerator and the base population of each state and Puerto Rico as the denominator, we developed the state-to-Puerto Rico and Puerto Rico-to-each state set of migration rates. In addition, since there are no reliable data to update this beginning set of rates, we are assuming that these migration rates remain constant throughout the projection cycle. Even so, the number of persons moving between the U.S. and Puerto Rico changes throughout the projection period due to the projected changes in the base population of each state and Puerto Rico.

Gross Immigration: The remaining components of net immigration consist of legal aliens, undocumented aliens, and the net movement of U.S. citizens. For convenience, we will refer to this component as gross immigration However, unlike the emigration and Puerto Rico components of net immigration, the gross immigration entering the United States had to be calculated. For these projections, we are assuming that the net immigration by age, sex, and race equals the assumption used in the national projections. Given this distribution and the total numbers of emigrants and net movement between the United States and Puerto Rico already calculated in the model, the gross immigration to the United States can be calculated as a residual.

Once the gross immigration to the United States is developed, the second step involves distributing this residual to each state. To distribute the gross immigration to each state, we relied upon the 1980 decennial data on the current residence of immigrants who entered the United States between 1975 and 1980. Since this distribution is developed using the responses to the decennial data, it includes documented and undocumented immigrants. By applying this 1980 distribution to the residual numbers developed in step one, we are able to allocate the gross immigration to each state.

INTERNAL MIGRATION:

Introduction: At the state level, internal migration is the most important and complex component of population change. In general, it is also the component that shows the greatest degree of fluctuation. Unfortunately, migration data are often the least timely and least comprehensive of the population data sets. For preparing "state of the art" demographic population projections, a complete migration data set should include timely, up-to-date information on in and out migration for demographic and geographic disaggrregations of the total population. Unfortunately, no single U.S. data source currently meets all the requirements of a complete data set.

In the absence of complete information, we have several alternatives. One alternative is to compromise the methodology to accommodate the available data. Another alternative is to

devise techniques to extract and combine the maximum information from available data set to produce a "synthetic" data set.

At the time of the last set of state population projections (Current Population Reports, Series P-25, No. 937), detailed tabulations of migration from the 1980 decennial census were not yet available. These projections relied upon net migration data and utilized a net migration projection system. (See Current Population Reports, Series P-25, No. 937 for a discussion of the inherent problems in a net migration system)

Multi-state projection or demographic accounting systems solve many of the faults of a net migration system.(Willekens) Place-to-place migration data can be used to explicitly model migration flows between states. The rate of moving from one origin state to one destination state is calculated and applied to the base population of the origin state. Using this approach in a projection system, the potential number of inmigrants to a state can be linked to the geographic as well as the age, sex, and race distribution of the population. The use of state-to-state migration rates also ensures that the sum total for the nation of all projected internal out and in migration is zero, a necessary ingredient of any multi-state model.

However, in order to use such "state-of-the-art" methods as multi-state demographic accounting, we need a migration data set that meets the following criteria:

1. Migration should be expressed as a destination-specific, out migration rate. In order to construct these rates, the data base must use state-to-state migration streams applied to a base period population.

2. Each of these streams should be disaggregated by the major demographic dimensions (eg. age, sex, and race).

In order to be used in a cohort component projection model that projects population on a yearly basis, an additional condition is required:

3. The migration data must be available for a 1-year migration interval.

Traditional multi-state models and many of the former methods used at the Census Bureau assume that the calculated migration rates remain constant throughout the projection period. In order to add a more dynamic element to the projection of migration rates, a further condition of the migration data set must be met:

4. The data should be available on an annual basis for a substantial number of time periods.

Finally, if the projections are to be used in the Census Bureau's production framework to produce annual population projections for single years of age, two final conditions must hold:

5. The data or some procedure to update them on a timely basis must be available - before more recent estimates make the projections obsolete.

6. The migration data must be consistent with the population base of the projection which is a census-level estimate.

Unfortunately, no single U.S. data source currently meets all six of the above conditions. In the United States, we have 3 major sources of migration data: national surveys (e.g. March supplement to the Current Population Survey), administrative data sets, and the decennial census. Each data set provides us with partial information and contains unique characteristics. (See Long and Wetrogan, "Creating Annual State-to-State Migration Flows, Paper Presented at 1985 Population Association of America for a complete discussion of the three data sets.) However, none of the three principal data sources available to us at this time meet the six requirements for a migration data set to be used in state-to-state population projections and we had to proceed by creating a "synthetic" data set.

Development of Base Year Migration Data Set: The first step in this process is to develop an appropriate beginning migration matrix of annual state-to-state migration rates by age, sex, and race. The 1975-80 decennial migration data provide us with a good beginning framework. However, while the census data provide us with good state-to-state data by age, sex, and race, these data cover a 5-year time frame, and our model requires the equivalent migration rates for a 1-year time frame.

Given the effects of return and repeat migration, it is not possible to simply divide the 5-year rate by five (Long and Boertlein, 1980; Rees, 1977). Instead, we had to develop an empirical relationship between the 1-year and 5-year migration data. Using the results of the questions on residence 1 year earlier in the 1976 and 1981 CPS, we developed an estimated average 1-year interstate migration rate for 1975-1980 by single years of age. We then produced an aggregated cohort migration rate for 5 years by adding the annual rates for 5 consecutive cohort single year of age groups. A comparison of the aggregated cohort migration rate with the corresponding 5-year interval migration rate for the 1975-1980 period from the 1980 CPS provides us with information by single years of age on the relationship of 1-year and 5-year migration data.

To compute the beginning state-to-state migration matrix by single years of age, sex, and race we assumed that the relationships between 5-year and 1-year interstate migration rates within a given age group derived using the CPS, apply equally for each age, sex, race, state-to-state flow from the decennial data. For consistency with the annual state estimates program, we further adjusted the beginning matrix of annual migration rates by single years of age, sex and race to reflect the overall state-to-state migration rates derived from an average of the 1976 to 1980 administrative data. The resulting beginning matrix of annual migration rates incorporates the migration levels implied by the administrative data, and the demographic dimensions implied by the decennial and CPS data.

Updating the Beginning Migration Matrix: The next stages of development involve devising a method to update quickly the beginning migration matrix to reflect the current or projected shifts in population distribution. The administrative data on migration from matched tax returns provide the best source to inform us about the change in migration trends since the 1975-1980 period.

The updating process adjusts for the change overtime in each state-to-state rate. For years in which the state-to-state rates are available from the administrative records, we can compute the ratio of the current state-to-state rate to the average of the 1976 to 1980 values. By assuming that the ratio of the current state-to-state rate to the 1976-1980 average applies to every age-sex-race group in the synthetic migration matrix, we can update the beginning migration matrix.

Projection of the Migration Matrix: For projection years beyond the last date of tax return data, some method of extending the state-to-state rates forward annually is necessary. For this set of projections, instead of the past practice of holding the current migration rates constant, we have added a dynamic element to our migration projections. We are relying upon the annual time series of state-to-state migration rates calculated from the administrative data from 1975 through 1986 to provide the basis for developing the projected trends. We begin by developing a 1995 value for each of the 2,601 state-to-state rates (51 state of origins x 51 state of destinations). For each of the 2,601 state-to-state rates, we estimate a linear regression model using the historical time series of data (the historical series excluded the 1977-1978 data). By extending the regression model forward, we can develop a preliminary 1995 value. In order to place some limits on the linear regression models, we evaluated the 1995 values with the mean of the historical data sets and the last observed values (the 1985-1986 migration rates). We accepted the regression value only if it was within a range of .8 to 1.2 times the mean of the historical data. In those cases, where the 1995 value exceeds this limit, we set the 1995 value at either .8 or 1.2 times the mean. In those cases where the actual 1986 and 1995 values were both outside the range, we set the 1995 value to equal the 1986 level. Once the 1995 value was established, the intermediate values between 1986 and 1995 were obtained by linear interpolation. For the years beyond 1995, the state-to-state rates were assumed to remain constant at the 1995 levels.

Projecting the Age, Sex, Race Specific State to State Rates: Once the annual state-to-state rates are projected, the next step involves updating the initial matrix of state-to-state migration rates by single years of age, sex,and race. We use the same process to update to a projected value as we developed to update to a current value. For each year 1987 to 1995, we can compute the ratio of the projected state-to-state rate to the average of the 1976 to 1980 values. By assuming that the ratio of the projected state-to-state rate to the 1976-1980 average applies to

every age-sex-race group in the synthetic migration matrix, we develop a set of projected state-to-state migration rates by single years of age, sex and race. Since we are assuming that the total state-to-state rates remain constant beyond years 1995, the matrix that is developed for 1995 applies for every year 1995 through 2010. Using this process, we have developed a set of state-to-state rates by single years of age, sex, and race that incorporates the annual trends implied by the administrative data and the age, sex and race distributions implied by the 1980 decennial data.

Fertility:

In order to develop projections of the number of births for each state, we need to have 1) the number of females of childbearing age in each state and 2) the rate at which these women will bear children.

For each projection year, the first step is to develop an approximation of the female population exposed to the possibility of childbearing during that period. Since the projection of births is the last component of population change to be developed, a preliminary projection of the population aged 1 and over is available for the end of the period. By averaging the appropriate July 1 female populations of each race by single years of age from age 14 through age 49, we can develope an approximation of the number of females exposed to childbearing during the period.

The next step in the projection process is the development of the appropriate state-age-race-specific fertility rates. The assumptions about future levels of fertility used in these projections are consistent with the revised middle series fertility assumption used in the national population projections (See Current Population Reports, Series P-25, No. 1018 for a complete discussion of the method used to develop these assumptions). In general, these projections assume a slight increase in the levels of fertility to an ultimate level of 1.8 births per woman. The national projections provide us with a set of annual age-specific birth rates by race for each projection year. However, for the state projections we need to make an additional assumption about the differentials in these rates by state.

Before making this assumption, we examined the patterns of state age-specific births rates. For the White population, using fertility data from the National Center for Health Statistics and decennial population data, we calculated state age-specific birth rates. For 1950, 1960, 1970, and 1980, we found considerable variation in the total fertility rates and the age patterns of childbearing among states. The fertility data for 1970 and 1980 for the Black population showed similar variation among states. For this set of state population projections, we are incorporating the existing differentials in state age-specific birth rates. Additionally, we are making the assumption that the existing patterns of state differentials remain constant throughout the projection period. (See Martin O'Connell, Regional

Fertility Patterns in the United States: Convergence or Divergence?", International Regional Science Review, Vol 6, no. 1, 1981)

In order to fully incorporate these assumptions into the projection model, we had to develop an initial set of age-specific birth rates for each state. The National Center for Health Statistics tabulates data for each state for births by age of mother for the White and Black populations. To calculate the initial set of rates, we averaged the 1979, 1980, and 1981 data on births by age of mother and race for each state. Using the 1980 census population in each state as the denominator, we developed an initial set of age-specific birth rates for the White and Black populations in each state.

To project the state rates forward to each year through 2010, we need to make an additional assumption concerning the trends in the initial set of state differentials. By making the assumption that the initial set of state differentials remain constant over time, we can apply the annual changes in the projected national rates to the individual state rates calculated in 1980 to obtain annual projections of the age-specific birth rates for each state.

We did not have sufficient data for the race groups other than White and Black to prepare a separate set of initial age-specific birth rates for each state. Since we did not have sufficient data to make any separate assumptions for this race group, we are applying the state age-specific birth rates for the White population to the "Other Races" population.

The total number of births is developed by applying the state age-specific birth rates to the appropriate female population. Once the number of births is obtained for each projection year, the national race-specific sex ratio at birth was used to divide the births into males and females. Finally the number of births by sex and race were survived forward, migrated from state to state and moved between the U.S. and abroad to give us the population under age 1 on July 1 of each projection year.

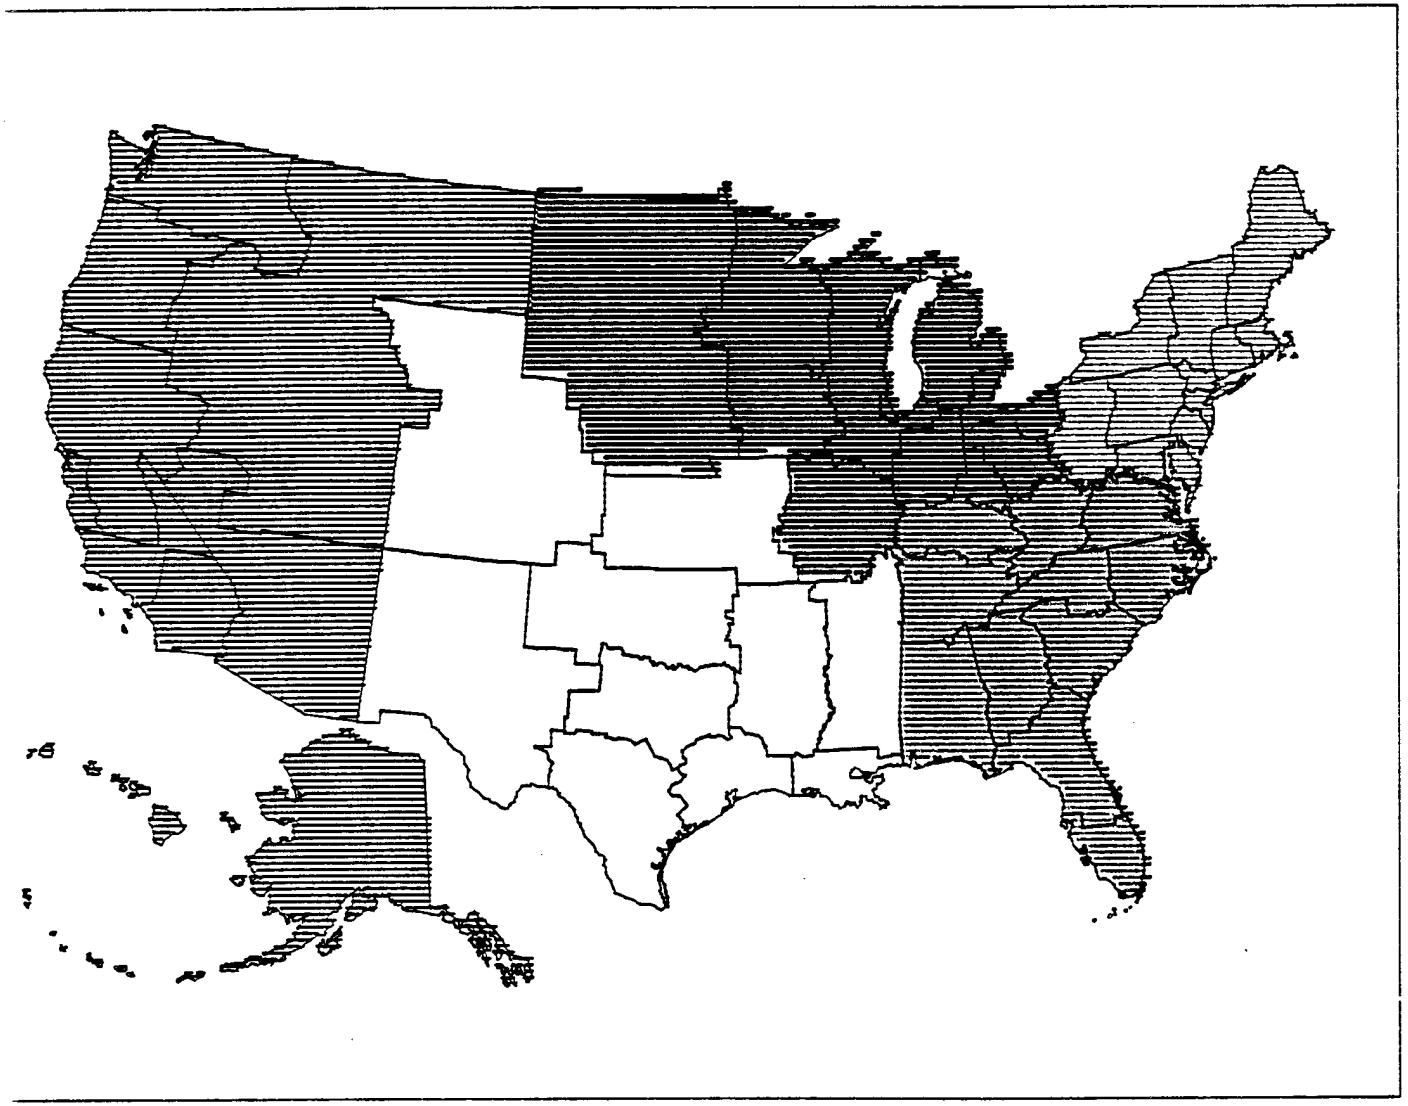

Adjustment to National Projections by Race, Sex and Age:

A final step in the projection model involves adjusting the sum of the State populations by age, sex and race to the middle series projections of the population of the United States (See Current Population Reports, Series P-25, No. 1018 for a discussion of the methodology used to develop these projections.). These national projections are prepared using the inflation-deflation procedure, which preserves the age pattern of undercount, but distorts the cohort changes. In addition, although the state projections system is consistent with the projected national trends in fertility and mortality, the state population projections model incorporated state differentials in mortality and fertility. Thus, the total number of births and deaths calculated in the state projections system will not equal the numbers developed in the national projections system. The comparison of the State totals by age, sex, and race to the U.S.

population revealed some differences. The State populations by age, sex, race were subsequently adjusted to the middle series national projections of the resident population to become consistent with the census-level projections using the inflation-deflation procedure. Thus the net sum of the annual components of change may not agree with the annual differences in the total population.
