13. ABSTRACT *(Maximum 200 words)*

This final Dredged Material Management Plan/Environmental Impact Statement (DMMP/EIS) presents the Corps of Engineers' programmatic plan for maintenance of the authorized navigation channel and certain publicly owned facilities in the lower Snake River reservoirs between Lewiston, Idaho and the Columbia River, and McNary reservoir on the Columbia River for 20 years; for management of dredged material from these reservoirs; and for maintenance of flow conveyance capacity at the most upstream extent of the Lower Granite reservoir for the remaining economic life of the dam and reservoir project (to year 2074). The Corps, along with the U.S. Environmental Protection Agency, analyzed four alternatives for this Final DMMP/EIS: Alternative 1 - No Action (No Change) - Maintenance Dredging With In-Water Disposal; Alternative 2 - Maintenance Dredging With In-Water Disposal to Create Fish Habitat and a 3-Foot Levee Raise; Alternative 3 - Maintenance Dredging With Upland Disposal and a 3-Foot Levee Raise; and Alternative 4 - Maintenance Dredging With Beneficial Use of Dredged Material and a 3-Foot Levee Raise (Recommended Plan/Preferred Alternative).

ERRATA SHEET FOR APPENDIX B - COST ESTIMATES

This appendix has not been substantially changed from the draft and will not be reprinted. Please make the following changes to the draft appendix and consider the draft appendix with corrections as the final appendix.

Front cover:
Apply the attached label (FINAL, July 2002) on the front cover to the right of the draft date.

Footnotes throughout the appendix:
Change all footnote references from "Draft DMMP/EIS, October 2001" to "Final DMMP/EIS, July 2002."

Page B-II
Change the first bullet at the top of the page to read:
Mobilization from as far away as the mouth of the Columbia River was included to allow wider competition in contracting.

Page B-V
Change the third bullet from the bottom of the page to read:
Mobilization from as far away as the mouth of the Columbia River was included to allow wider competition in contracting.

Page B-VI
Add following the last bullet at the top of the page:
Disposal at the Joso site will actually require dredging of the access channel into the site at a cost during the first year of $95,332 including indirect costs. However, since this cost is less than 1 percent of the first-year dredging and site construction cost ($9,738,000), the Upland 3.a.b Cost Estimate was not revised. Details of the dredging cost breakdown can be seen in the Contingency Upland Disposal Cost Estimate on pages B-251 and B-252.

Section 3.1.3 Confluence Dredging - Snake and Clearwater Rivers [300,000 cy (229 367 m^3) Dredging Program]
Page B-VII
Change the title to read:
Template Dredging: Year 1 to end of project [300,000 cy (229 367 m^3)] and Upland Disposal Site Construction: Years 1, 21, 27, and 28

Section 3.1.3 Confluence Dredging - Snake and Clearwater Rivers [300,000 cy (229 367 m^3) Dredging Program]
Page B-VII
Change the 4th sentence from the end to read:
Construction of the RCC cap at the Chief Timothy transfer site and initial disposal in the Page Creek disposal site will occur in year 28.

TABLE OF CONTENTS (continued)

Page

1.0 COST ESTIMATE SUMMARY - GENERAL

The following is a summary of the assumptions and parameters used to develop estimated costs for disposal of dredged material. Detailed estimates follow this summary in the same order as they are presented in the summary. The costs include overhead and profit, but escalation and contingencies have not been included in the calculations.

In the following discussions, the two general dredging operations are described as template dredging and template maintenance dredging. The term "template dredging" is used to describe the process of initial cleanout of the defined dredging template. "Template maintenance dredging" is used to describe the dredging required to keep the defined template free of sediment for the remainder of the study period. Larger annual quantities of dredged material are projected for the initial effort to create the dredging template. Smaller annual quantities are projected for the period focused on maintaining the established template.

2.0 IN-WATER DISPOSAL ESTIMATES

These planning level estimates for disposal of dredged materials using in-water disposal were produced utilizing the Cost Engineering Dredge Estimating Program (CEDEP). The Government Estimate is based on the following assumptions:

- Work will be conducted 24 hours per day in three 8-hour shifts per day, 7 days a week, considering four holidays. Overtime hours are anticipated.
- Dredging operations will begin on December 15 and shall not continue after February 28 in any given year due to the fish window requirements.
- The prime contractor will perform all work.
- All in-water disposal sites are accessible without further dredging requirements.
- Dredging will be accomplished using 15-cubic yard (cy) [11.5-cubic meter (m^3)] clamshell dredges in the Snake/Clearwater Rivers confluence area in the Lower Granite reservoir and 10-cy (7.6-m^3) clamshell dredges in the other reservoirs. The use of clamshells and scows has been considered due to the anticipated existence of silt type materials within the confluence areas.
- Dredged material will be transported to in-water disposal sites with scows. No overflow will be allowed.
- This work will take place during winter months, but no adverse weather conditions other than normal winter work weather have been assumed.
- The anticipated types of soil to be encountered are sand, silts, gravels, and cobbles.
- Considerations for delays due to traffic and coordination efforts have been accounted for within the effective working time.
- All necessary labor will be available within the project location.

- Equipment will be mobilized from as far away as the mouth of the Columbia River to allow contractors from Portland and Seattle to compete.
- Turbidity monitoring will be required during the dredging operation.
- Sieve analysis testing for coarse-grained and fine-grained materials will be required for determining which disposal area to use.
- All equipment is considered owned - no rental equipment is considered. All equipment other than dredging plant rates were computed based on Engineering Pamphlet (EP) 1110-1-8. All equipment other than dredging plant mobilization and demobilization costs are computed as 5 percent of direct costs.

2.1 Confluence Dredging - Snake and Clearwater Rivers

There are four different dredging programs proposed for the Snake/Clearwater Rivers confluence area. The Snake River dredging areas associated with the confluence dredging programs are assumed to extend from the vicinity of Silcott Island near Snake River Mile (RM) 131 to the U.S. Highway 12 Bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake RM 139.5. The Clearwater River dredging areas are assumed to extend from the Snake/Clearwater Rivers confluence upstream to the Port of Lewiston (from Clearwater RM 0.00 to Clearwater RM 1.66). All material is assumed to be disposed of in-water at sites between Centennial Island located near Snake RM 120.5 and the upstream face of Lower Granite Dam (RM 108). The disposal sites are assumed adequate to contain all materials dredged.

The four dredging programs proposed for the Snake/Clearwater Rivers confluence area vary in the quantity of material removed annually. Two of the programs include an initial multi-year template dredging operation followed by a smaller-volume template maintenance dredging operation for the rest of the study period. The volumes and timing of the dredging associated with each of the programs are explained in the following sections.

2.1.1 Confluence Dredging - Snake and Clearwater Rivers [2 million cy (1 529 110 m^3) Dredging Program]

The 2 million cy (1 529 110 m^3) dredging program will consist of a template dredging operation and a template maintenance dredging operation.

2.1.1.1 Template Dredging: Years 1 through 20 [2 million cy (1 529 110 m^3) annually]

Dredging will be done to excavate the defined dredging template during the first 20 years of the project, removing 2 million cy (1 529 110 m^3) of material annually. Material will be hauled to designated spots and used to construct beneficial habitat. This portion of the work will cost approximately $4.5 million annually.

2.1.1.2 Template Maintenance Dredging: Year 21 to end of project [725,000 cy (554 302 m^3) annually]

Template maintenance dredging will continue from year 21 to the end of the project, removing approximately 725,000 cy (554 302 m^3) of material annually. Material will be hauled to designated spots and used to construct beneficial habitat. This portion of the work will cost approximately $2.4 million annually.

2.1.2 Confluence Dredging - Snake and Clearwater Rivers [1 million cy (764 555 m^3) Dredging Program]

The 1 million cy (764 555 m^3) dredging program will also consist of a template dredging operation and a template maintenance dredging operation.

2.1.2.1 Template Dredging: Years 1 through 10 [1 million cy (764 555 m^3) annually]

Dredging will be done to excavate the defined dredging template during the first 10 years of the project, removing 1 million cy (764 555 m^3) of material annually. Material will be hauled to designated spots and used to construct beneficial habitat. This portion of the work will cost approximately $2.4 million annually.

2.1.2.2 Template Maintenance Dredging: Year 11 to end of project [325,000 cy (248 480 m^3) annually]

Template maintenance dredging will continue from year 11 to the end of the project, removing approximately 325,000 cy (248 480 m^3) of material annually. Material will be hauled to designated spots and used to construct beneficial habitat. This portion of the work will cost approximately $1.3 million annually.

2.1.3 Confluence Dredging - Snake and Clearwater Rivers [300,000 cy (229 367 m^3) Dredging Program]

The 300,000 cy (229 367 m^3) dredging program includes only a template dredging component. Template dredging will continue throughout the project, removing approximately 300,000 cy (229 367 m^3) of material annually. Material will be hauled to designated spots and used to construct beneficial habitat. This portion of the work will cost approximately $1.2 million annually.

2.1.4 Confluence Dredging - Snake and Clearwater Rivers Maintenance Dredging Program

The navigation and facility maintenance dredging program will maintain the design templates of features within the confluence area such as the Federal navigation channel, recreational facilities, and irrigation intakes. Dredging will not extend outside the limits of the original design template of each feature.

Maintenance dredging will continue throughout the project, starting in year 5 and then again in year 10 when 41,500 cy (31 729 m^3) of material will be removed from within the authorized navigation channel. At 10-year intervals thereafter, an additional 41,500 cy (31 729 m^3) of material will be removed. Material will be hauled to designated spots and used to construct beneficial habitat. This portion of the work will cost approximately $389,000 each year dredging takes place.

2.2 Dredging McNary Reservoir [32,000 cy (24 466 m^3)]

The Columbia and Snake Rivers' McNary reservoir dredging areas are assumed to extend throughout the vicinity of the Ice Harbor Cut Navigation Channel from Snake RM 3 to Snake RM 9, located upstream of the confluence of the Columbia and Snake Rivers. All material is assumed to be disposed of between Columbia RM's 314.5 and 316.5.

Maintenance Dredging: 2-Year Intervals [32,000 cy (24 466 m^3)]

Dredging operations in the McNary reservoir will take place on a semi-annual basis, removing approximately 32,000 cy (24 466 m^3) with each effort. This portion of the work will cost approximately $297,000 semi-annually.

2.3 Dredging Ice Harbor Reservoir [2,000 cy (1 529 m^3)]

The Snake River's Ice Harbor reservoir dredging area is located downstream of Lower Monumental Dam. All material is assumed to be disposed of between Snake RM's 10 and 23.

Maintenance Dredging: 2-Year Intervals [2,000 cy (1 529 m^3)]

Dredging operations in the Ice Harbor reservoir will take place on a semi-annual basis, removing approximately 2,000 cy (1 529 m^3) with each effort. This portion of the work will cost approximately $192,000 semi-annually.

2.4 Dredging Lower Monumental Reservoir [2,000 cy (1 529 m^3)]

The Snake River's Lower Monumental reservoir dredging area is located downstream of Little Goose Dam and near the confluence of the Palouse and Snake Rivers. All material is assumed to be disposed of between Snake RM's 42 and 47.

Maintenance Dredging: 2-Year Intervals [2,000 cy (1 529 m^3)]

Dredging operations in the Lower Monumental reservoir will take place on a semi-annual basis, removing approximately 2,000 cy (1 529 m^3) with each effort. This portion of the work will cost approximately $230,000 semi-annually.

2.5 Dredging Little Goose Reservoir [4,000 cy (3 058 m^3)]

The Snake River's Little Goose reservoir dredging area is located downstream of Lower Granite Dam and at Schultz Bar, located near Snake RM 100. All material is assumed to be disposed of between Snake RM's 71 and 83.

Maintenance Dredging: 2-Year Intervals [4,000 cy (3 058 m^3)]

Dredging operations in the Little Goose reservoir will take place on a semi-annual basis, removing approximately 4,000 cy (3 058 m^3) with each effort. This portion of the work will cost approximately $248,000 semi-annually.

3.0 UPLAND DISPOSAL ESTIMATES

These planning level estimates were produced utilizing the MICRO Computer Aided Cost Estimating System (MCACES) and the CEDEP. The Government Estimate is based on the following assumptions:

- Work will be conducted 24 hours per day in three 8-hour shifts per day, 7 days a week, considering four holidays. Overtime hours are anticipated.
- Dredging operations will begin on December 15 and shall not continue after February 28 in any given year to comply with agency requirements that prohibit in-water work during periods of fish migration.
- The prime contractor will perform all work.
- All disposal transfer sites are accessible without further dredging requirements.
- Dredging will be accomplished using 10-cy (7.6-m^3) clamshell dredges and material will be transported on scows for disposal. The dredging material will be off-loaded from the barges on to the disposal area. The use of clamshells and scows has been considered due to the anticipated existence of silt type materials within the confluence areas.
- The anticipated types of soil to be encountered are sand, silts, gravels, and cobbles.
- Considerations for delays due to traffic and coordination efforts have been accounted for within the effective working time.
- No adverse weather conditions other than normal winter work weather have been assumed.
- All necessary labor will be available within the project location.
- Equipment will be mobilized from the mouth of the Columbia River to allow contractors from Portland and Seattle to compete.
- Turbidity monitoring will be required during the dredging operation.
- Sieve analysis testing for coarse-grained and fine-grained materials will be required for determining which disposal area to use.

- All equipment is considered owned - no rental equipment is considered. All equipment other than dredging plant rates were computed based on EP 1110-1-8. All equipment other than dredging plant mobilization and demobilization costs are computed as 5 percent of direct costs.

3.1 Confluence Dredging - Snake and Clearwater Rivers

For the upland disposal operation, the dredging programs are similar to those described for the in-water disposal operation. The dredging areas and volumes of dredged material removed are the same (see section 2.1), but the material is assumed to be disposed of in designated upland sites. The disposal sites are assumed to contain all materials dredged.

The following sections describe the dredging and disposal activities for the four dredging programs with emphasis on the development of the upland disposal sites.

3.1.1 Confluence Dredging - Snake and Clearwater Rivers [2 million cy (1 529 110 m^3) Dredging Program]

The 2 million cy (1 529 110 m^3) dredging program will consist of a template dredging operation and a template maintenance dredging operation.

3.1.1.1 Template Dredging: Years 1 through 20 [2 million cy (1 529 110 m^3)] and Upland Disposal Site Construction: Years 1 and 2

The initial construction of the Chief Timothy transfer site and the Page Creek upland disposal site will occur in year 1. Upland disposal of dredged materials during the first year will be restricted to temporary placement of the materials at the Chief Timothy transfer site. Year 2 will include construction of the Chief Timothy transfer site roller-compacted concrete (RCC) cap and upland disposal of dredged materials at Page Creek. Dredging will remove approximately 2 million cy (1 529 110 m^3) of material annually for the first 20 years to establish the defined dredging template. The estimated cost of this work is $33.4 million over the first 2 years and $20.2 million annually for years 3 through 20.

3.1.1.2 Template Maintenance Dredging: Year 21 to end of project [725,000 cy (554 302 m^3)]

Starting in year 21, the dredging operations would be scaled back, reducing the quantity of dredged material to 725,000 cy (554 302 m^3) annually. This amount of material would be disposed of at the Page Creek site through the remainder of the project. The estimated annual cost of this work is $8.3 million.

3.1.2 Confluence Dredging - Snake and Clearwater Rivers [1 million cy (764 555 m^3) Dredging Program]

The 1 million cy (764 555 m^3) dredging program will also consist of a template dredging operation and a template maintenance dredging operation.

3.1.2.1 Template Dredging: Years 1 through 10 [1 million cy (764 555 m^3)] and Upland Disposal Site Construction: Years 1 through 3

The initial construction of the Chief Timothy transfer site and the Page Creek upland disposal site will occur in year 1. Upland disposal of dredged materials during the first year will be restricted to temporary placement of the materials at the Chief Timothy transfer site. Year 3 will include construction of the Chief Timothy transfer site RCC cap and upland disposal of dredged materials at Page Creek. Dredging will remove approximately 1 million cy (764 555 m^3) of material annually for the first 10 years to establish the defined dredging template. The estimated cost of this work is $23.9 million over the first 3 years and $10.3 million annually for years 4 through 10.

3.1.2.2 Template Maintenance Dredging: Year 11 to end of project [325,000 cy (248 480 m^3)]

Starting in year 11, the dredging operations would be scaled back, reducing the quantity of dredged material to 325,000 cy (248 480 m^3) annually. This amount of material would be disposed of at the Page Creek site through the remainder of the project. The estimated annual cost of this work is $5.7 million.

3.1.3 Confluence Dredging - Snake and Clearwater Rivers [300,000 cy (229 367 m^3) Dredging Program]

Template Dredging: Year 1 to end of project [300,000 cy (229 367 m^3) and Upland Disposal Site Construction: Years 1, 21, and 27

The 300,000 cy (229 367 m^3) dredging program includes only a template dredging component. Template dredging will continue throughout the project, removing approximately 300,000 cy (229 367 m^3) of material annually. The upland disposal site at Joso will be constructed during the first year and dredged material will be deposited at the Joso site for the first 20 years of the project. In year 21, the Chief Timothy transfer site will be constructed. Starting in year 21 and continuing until year 28, all of the dredged material [300,000 cy (229 367 m^3) annually] will be used to develop the Chief Timothy transfer site. In year 27, construction of the Page Creek upland disposal site will begin. Construction of the RCC cap at the Chief Timothy transfer site and initial construction of the Page Creek disposal site will occur in year 28. The total cost of the work through year 28 is estimated at $122.6 million. From year 29 to the end of the project, the materials will be disposed of at the Page Creek site. The annual cost of this work is estimated at $3.6 million.

3.1.4 Confluence Dredging - Snake and Clearwater Rivers (Maintenance Dredging Program)

The navigation and facility maintenance dredging program will maintain the design templates of features within the confluence area such as the Federal navigation channel, recreational facilities,

and irrigation intakes. Dredging will not extend outside the limits of the original design template of each feature.

Construction of the Joso disposal site and disposal of 41,500 cy (31 729 m^3) of dredged material at the Joso site will occur in year 5. Maintenance dredging operations will dispose of an additional 41,500 cy (31 729 m^3) of material at the Joso site in year 10 and at 10-year intervals after that until the end of the project. Initial construction of the Joso disposal site and placement of 41,500 cy (31 729 m^3) of dredged material at the Joso site during the first year will cost $3.2 million. Disposal of an additional 41,500 cy (31 729 m^3) of dredged material during year 10 of the project will cost an additional $1 million. Disposal of 41,500 cy (31 729 m^3) at 10-year intervals during the remainder of the project will cost $1 million per operation.

3.2 Dredging McNary Reservoir [32,000 cy (24 466 m^3)]

The Columbia and Snake Rivers' McNary reservoir dredging areas are assumed to extend throughout the vicinity of the Ice Harbor Cut Navigation Channel from Snake RM 3 to Snake RM 9, located upstream of the confluence of the Columbia and Snake Rivers. All material is assumed to be disposed of in designated upland sites.

Maintenance Dredging: Year 1 to end of project [32,000 cy (24 466 m^3)] and Upland Disposal Site Construction: Year 1

The first year of operation will include construction of the Joso site and upland disposal of 32,000 cy (24 466 m^3) of dredged material. Semi-annual maintenance dredging will remove and dispose of 32,000 cy (24 466 m^3) of dredged material at the Joso site. Initial construction of the Joso disposal site and disposal of 32,000 cy (24 466 m^3) of material during the first year will cost $2.9 million. The remainder of the work will cost approximately $683,000 semi-annually.

3.3 Dredging Ice Harbor Reservoir [2,000 cy (1 529 m^3)]

The Snake River's Ice Harbor reservoir dredging area is located downstream of Lower Monumental Dam. All material is assumed to be disposed of in designated upland sites.

Maintenance Dredging: Year 1 to end of project [2,000 cy (1 529 m^3)]

Maintenance dredging will consist of removing 2,000 cy (1 529 m^3) annually from the Ice Harbor reservoir, hauling the material to the Joso site, and disposing of the material at the Joso site. This portion of the work will cost approximately $204,000 semi-annually.

3.4 Dredging Lower Monumental Reservoir [2,000 cy (1 529 m^3)]

The Snake River's Lower Monumental reservoir dredging area is located downstream of Little Goose Dam and near the confluence of the Palouse and Snake Rivers. All material is assumed to be disposed of in designated upland sites.

Maintenance Dredging: Year 1 to end of project [2,000 cy (1 529 m^3)]

Maintenance dredging will consist of removing 2,000 cy (1 529 m^3) semi-annually from the Lower Monumental reservoir, hauling the material to the Joso site, and disposing of the material at the Joso site. This portion of the work will cost approximately $208,000 semi-annually.

3.5 Dredging Little Goose Reservoir [4,000 cy (3 058 m^3)]

The Snake River's Little Goose reservoir dredging area is located downstream of Lower Granite Dam and at Schultz Bar, near Snake RM 100. All material is assumed to be disposed of in designated upland sites.

Maintenance Dredging: Year 1 to end of project [4,000 cy (3 058 m^3)]

Maintenance dredging will consist of removing 4,000 cy (3 058 m^3) semi-annually from the Little Goose reservoir, hauling the material to the Joso site, and disposing of the material at the Joso site. This portion of the work will cost approximately $244,000 semi-annually.

3.6 Dredging Contaminated Material [7,000 cy (5 352 m^3)]

The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake RM 131 to the State Highway 12 Bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake RM 139.5. The Clearwater River dredging areas are assumed to extend from the Snake/Clearwater Rivers confluence upstream to the Port of Lewiston (from Clearwater RM 0.00 to Clearwater RM 1.66). All material is assumed to be disposed of utilizing a disposal area at Joso near Snake RM 56. The disposal site is assumed adequate to contain all materials dredged. It is anticipated that, on an annual basis, approximately 7,000 cy (5 352 m^3) of material will be dredged that will be determined to contain contaminated materials that will require upland disposal at a site designed to contain such materials. A site will be developed at Joso that is appropriate for containment of contaminated materials.

Maintenance Dredging: Year 1 to end of project [7,000 cy (5 352 m^3)] and Joso Contingency Upland Disposal Site Construction: Year 1

Initial construction of the Joso disposal site and disposal of approximately 7,000 cy (5 352 m^3) of contaminated dredged material will take place in the first year. The estimated cost of initial construction, dredging, and disposal of materials in the first year is $11,612,000. It was assumed that disposal of approximately 7,000 cy (5 352 m^3) of contaminated dredged material will take place each confluence dredging operation. The estimated cost of this work is $230,000 per year that dredging takes place in the confluence area.

Release 1.2c

Project Description:
The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66.
All material assumed to be disposed of from downstream of Centennial Island located near Snake River Mile 120.5 to the upstream face of Lower Granite Dam River Mile 108. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to the Confluence of the Snake and Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve

analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Release 1.2c

Project Description:
The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66.
All material assumed to be disposed of from downstream of Centennial Island located near Snake River Mile 120.5 to the upstream face of Lower Granite Dam River Mile 108. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to the Confluence of the Snake and Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve

analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

LABOR ID: NWW99D EQUIP ID: NAT97C CREW ID: NAT99A UPB ID: UP99EA

Project Description:
The Snake River, Lower Monumental Pool dredging area is located downstream of Little Goose Dam and near the confluence of the Palouse and Snake River confluence. All material assumed to be disposed of between Snake River Mile 42 to Snake River Mile 47.

Basis of Design:
Planning level estimate produced utilizing the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 10cy clamshell dredges, with the use of scows for in-water disposal.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to Little Goose Lock and Dam, approximately 394 River Miles to allow contractors from Portland & Seattle to compete.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.

Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Release 1.2c

Project Description:
The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66.
All material assumed to be disposed of utilizing a transfer station near Snake River Mile 131, located near the Mouth of Alpowa Creek where the material will be temporarily stored. The material will be rehandled from the Transfer Station to the final Disposal Area at the Page Creek - East Side Site. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating System (MCACES) and Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements. Construction of the Transfer Station and the Disposal Area will occur during year one.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal. The Transfer Station and the Disposal Area will be constructed during the first year. The first years dredging material will be used for development of the Transfer Station. After year one the dredging material will be offloaded from the barges on to the Transfer Site where the material will be allowed to dewater. The material may be moved from the Transfer Station to the final Disposal area throughout the remainder of the year.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than

normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Dredging Plant Equipment Mobilization will be from the Mouth of the Columbia River to the Confluence of the Snake and Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment considered. All equipment other than dredging plant rates were computed based on the EP 1110-1-8. All equipment other than Dredging Plant mob and demob costs computed as 5% of the direct costs.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP), Historical Dredging Equipment information, and EP 1110-1-8.

Dredging 725tCuY Confl. Upland D
DMMS Dredging
of Snake & Clearwater Rivers
with Upland Disposal

Designed By: Walla Walla District COE
Estimated By: R. Hynek and J. Davin

Prepared By: Cost Engineering Branch
Kim Callan, Chief

Preparation Date: 05/28/99
Effective Date of Pricing: 05/01/99
Est Construction Time: 60 Days

Sales Tax: 7.90%

Release 1.2c

Project Description:
The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66.
All material assumed to be disposed of utilizing a transfer station near Snake River Mile 131, located near the Mouth of Alpowa Creek where the material will be temporarily stored. The material will be rehandled from the Transfer Station to the final Disposal Area at the Page Creek - East Side Site. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating System (MCACES) and Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal. The dredging material will be offloaded from the barges on to the transfer site where the material will be allowed to dewater. The material may be moved from the Transfer Station to the final Disposal Area throughout the remainder of the year.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment

Mobilization will be from the Mouth of the Columbia River to the Confluence of the Snake and Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment considered. All equipment other than dredging plant rates were computed based on the EP 1110-1-8. All equipment other than Dredging Plant mob and demob costs computed as 5% of the direct costs.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs included Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

LABOR ID: NAT99A EQUIP ID: NAT97C CREW ID: NAT99A UPB ID: UP99EA

Project Description: The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66. All material assumed to be disposed of utilizing a transfer station near Snake River Mile 131, located near the Mouth of Alpowa Creek where the material will be temporarily stored. The material will be rehandled from the Transfer Station to the final Disposal Area at the Page Creek - East Side Site. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design: Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating System (MCACES) and Cost Engineering Dredge Estimating Program (CEDEP)

Overtime: Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows: Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements. Construction of the Transfer Station and the Disposal Area will occur during years one and two.

Sub Contracting Plan: No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access: It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology: Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal. The Transfer Station and the Disposal area will be constructed during the first two years. The first two years dredging material will be used for development of the Transfer Station. After year two the dredging material will be offloaded from the barges on to the Transfer Station site where the material will be alowed to dewater. The material may be moved from the Transfer Station to the final Disposal Area throughout the remainder of the year.

Conditions: This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal
winter work weather has been assumed.

Equipment/Labor Availability &
Distance Traveled: Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia

River to the Confluence of the Snake and Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equiment considered. All equipment other than the dredging plant rates were computed based on the EP 1110-1-8. All equipment other than Dredging Plant mob and demob costs computed as 5% of the direct costs.

Environmental Concerns: Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Dredging 325tCuY Confl. Upland D
DMMS Dredging
of Snake & Clearwater Rivers
with Upland Disposal

Designed By: Walla Walla District COE
Estimated By: R. Hynek and J. Davin

Prepared By: Cost Engineering Branch
Kim Callan, Chief

Preparation Date: 05/28/99
Effective Date of Pricing: 05/01/99
Est Construction Time: 60 Days

Sales Tax: 7.90%

Release 1.2c

Project Description:
The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66.
All material assumed to be disposed of utilizing a transfer station near Snake River Mile 131, located near the Mouth of Alpowa Creek where the material will be temporarily stored. The material will be rehandled from the Transfer Station to the final Disposal Area at the Page Creek - East Side Site. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating System (MCACES) and Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal. The dredging material will be offloaded from the barges on to the transfer site where the material will be allowed to dewater. the materail may be moved from the Transfer Station to the final Disposal Area throughout the remainder of the year.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment

Mobilization will be from the Mouth of the Columbia River to the Confluence of the Snake and Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment considered. all equipment other than dredging plant rates were computed based on the EP 1110-1-8. All equipment other than Dredging Plant mob and demob costs computed as 5% of the direct costs.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Upland 3.a.b

Dredging 3hT CuY Confl.Upland#29
DMMS Dredging
of Snake & Clearwater Rivers
with Upland Disposal

Designed By: Walla Walla District COE
Estimated By: R. Hynek and J. Davin

Prepared By: Cost Engineering Branch
Kim Callan, Chief

Preparation Date: 05/28/99
Effective Date of Pricing: 05/01/99
Est Construction Time: 60 Days

Sales Tax: 7.90%

Release 1.2c

Project Description:
The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66.
All material assumed to be disposed of utilizing a Disposal Area at Joso near river mile 56. The Disposal Area is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing MICRO Computer Aided Cost Estimating Program (MCACES) and the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal. Construction of the Disposal Area will occur during the first year. The dredging material will be offlaoded from the barges on to the Disposal Area.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to the Confluence of the Snake and Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment considered. All equipment other than dredging

plant rates were computed based on the EP 1110-1-8. All equipment other than dredging plant mob and demob costs computed as 5% of the direct costs.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

by Building Systems Design, Inc.
Release 1.2c

Project Description: The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66. All material assumed to be disposed of utilizing a Transfer Station near Snake River Mile 131, located near the Mouth of Alpowa Creek where the material will be temporarily stored. The material will be rehandled from the Transfer Station to the final Disposal Area at the Page Creek - East Side Site. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design: Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating System (MCACES) and Cost Engineering Dredge Estimating Program (CEDEP)

Overtime: Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 24 hr/day, 3-8 hour shifts/day, 7 days/week, considering 4 holidays.

Construction Windows: Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements. Construction of the Transfer Station and the Disposal Area will occur during year the first 7 years.

Sub Contracting Plan: No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access: It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology: Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal. The Transfer Station will be constructed during the first year. The first seven years dredging material will be used for developement of the Transfer Station. The Disposal Area wil be constructed during year seven. After year seven the dredging material will be offloaded from the barges on to the transfer site where the material will be allowed to dewater. The material may be moved from the Transfer Station to the Disposal Area throughout the remainder of the year.

Conditions: This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled: Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to the Confluence of the Snake and

Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment considered. All equipment other than dredging plant rates were computed based on the EP 1110-1-8. All equipment other than dredging plant mob and demob costs computed as 5% of direct costs.

Environmental Concerns: Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99!
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Release 1.2c

Project Description:
The Snake River dredging areas are assumed to extend from the vicinity of Silcott Island near Snake River Mile 131 upstream to the State Highway 12 bridge upstream of the confluence of the Snake and Clearwater Rivers, located near Snake River Mile 139.5. The Clearwater River dredging areas are assumed to extend from the Snake River confluence upstream to the Port of Lewiston, from Clearwater River Mile 0.00 to Clearwater River Mile 1.66.
All material assumed to be disposed of utilizing a Disposal Area at Joso near river mile 56. The Disposal Area is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating Program (MCACES) and the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on an 8 hour operation. Work shall be conducted on a 8 hr/day, 1-8 hour shift/day, 6 days/week.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 15cy clamshell dredges, with the use of scows for in-water disposal. Construction of the Disposal Area will occur during the first year. The dredging material will be offloaded from the barges on tot he Disposal Area.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to the Confluence of the Snake and Clearwater Rivers, approximately 463 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment condsidered. All equipment other than dredging

plant rates were computed based on the EP 1110-1-8. All equipment other than dredging plant mob and demob costs computed as 5% of direct costs.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Release 1.2c

Project Description:
The Columbia and Snake Rivers, McNary Pool dredging areas are assumed to extend throughout the vicinity of the Ice Harbor Cut Navigation Channel from Snake River Mile 3 to Snake River Mile 9. All material assumed to be disposed of utilizing a Disposal Areaa at the Joso near Snake River Mile 56. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating System (MCACES) and the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 8 hour operation. Work shall be conducted on a 8 hr/day, 1-8 hour shifts/day, 6 days/week.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 10cy clamshell dredges, with the use of scows for in-water disposal. Construction of the Disposal Area will occur during the first year. The dredging material will be offloaded from the barges on to the Disposal Area.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to Ice Harbor Lock and Dam, approximately 334 River Miles to allow contractors from Portland & Seattle to compete. All equipment is condisered owned - no rental equipment considered. All equipment other than dredging plant rates were computed based on the EP 1110-1-8. All equipment other than dredging plant mob and demob costs computed as 5% of direct costs.

Environmental Concerns:

Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Release 1.2c

Project Description:
The Snake River, Ice Harbor Pool dredging area is located downstream of Lower Monumental Dam. All material assumed to be disposed of utilizing a Disposal Area at Joso near Snake River Mile 56. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating Program (MCACES) and the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 8 hr/day, 1-8 hour shifts/day, 5 days/week.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 10cy clamshell dredges, with the use of scows for in-water disposal. The dredging material will be offloaded from the barges on to the Disposal Area.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to Lower Monumental Lock and Dam, approximately 365 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment considered. All equipment other than dredging plant rates were computed based onthe EP 1110-1-8. All equipment other than dredging plant mob and demob costs computed as 5% of direct costs.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be

required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Project Description:
The Snake River, Lower Monumental Pool dredging area is located downstream of Little Goose Dam and near the confluence of the Palouse and Snake River confluence. All material assumed to be disposed of utilizing a Disposal Area at Joso near Snake River Mile 56. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating Program (MCACES) and the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on an 8 hr/day, 1-8 hour shift/day, 5 days/week.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 10cy clamshell dredges, with the use of scows for in-water disposal. The dredging material will be offloaded from the barges on to the Disposal Area.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to Little Goose Lock and Dam, approximately 394 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment considered. All equipment other than dredging plant rates were computed based on the EP 1110-1-8. All equipment other than dredging plant mob and demob costs computed as 5% of direct costs.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve

analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Release 1.2c

Project Description:
The Snake River, Little Goose Pool dredging area is located downstream of Lower Granite Dam and at Schultz Bar located near Snake River Mile 100. All material assumed to be disposed of utilizing a Disposal Area at Joso near Snake River Mile 56. The disposal site is assumed adequate to contain all materials dredged.

Basis of Design:
Planning level estimate produced utilizing the MICRO Computer Aided Cost Estimating System (MCACES) and the Cost Engineering Dredge Estimating Program (CEDEP)

Overtime:
Overtime is anticipated. The Government Estimate is based on a 24 hour operation. Work shall be conducted on a 8 hr/day, 1-8 hour shift/day, 5 days/week.

Construction Windows:
Dredging operations will begin on 15 December, and shall not continue after 28 Feb, in any given year, due to the fish window requirements.

Sub Contracting Plan:
No Sub Contracting considered all work to be performed by Prime Contractor.

Site Access:
It is assumed all Disposal Transfer Sites & the In-water Disposal sites are accessible without further dredging requirements.

Construction Methodology:
Common dredging methods using 10cy clamshell dredges, with the use of scows for in-water disposal. The dredging material will be offloaded from the barges on to the Disposal Area.

Conditions:
This work will take place during winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled:
Assume labor will be available within the project location. Equipment Mobilization will be from the Mouth of the Columbia River to Lower Granite Lock and Dam, approximately 431 River Miles to allow contractors from Portland & Seattle to compete. All equipment is considered owned - no rental equipment considered. All equipment other than dredging plant rates were computed based on the EP 1110-1-8. All equipment other than dredging plant mob and demob costs computed as 5% of direct costs.

Environmental Concerns:
Turbidity monitoring will be required during the dredging operation. Sieve

analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies:
Total costs include Overhead and Profit. Escalation and contingencies are not included.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: Cost Engineering Dredge Estimating Programs (CEDEP) and Historical Dredging Equipment information.

Release 1.2

Project Description: The JOSO Dredge Material Disposal Site is located along the southern shore of the Snake River between River Miles 56.5 and 56.8. The Disposal site will consist of two types of material disposal, about 25% of the pit will be lined for contaminated material storage. A barge slip and unloading area will be constructed at the West end of the Joso Site. Landings will be formed on either side of the slip for crane access. Two temporary dredged material storage areas will be developed adjacent to the slip for dewatering. One temporary storage area will be completely lined. A haul road will be developed to transport material from the unloading area/temporary storage to the permanent disposal area.

Basis of Design: Estimate based on preliminary drawings provided by soils/civil branch. Excavation and fill quantities provided by soils/civil branch. Estimate for Sheet Pile and in-water Mooring dolphins based on Port of Benton Modifications Estimate, Revision #4.

Overtime: Overtime is anticipated. The Government Estimate is based on a 8 hour operation. Work shall be conducted on a 8 hr/day, 1-8 hour shifts/day, 6 days/week.

Construction Windows: Most work will be accomplished in dry conditions between July 2002 and November 2002. Remaining work will be in-water and restricted to beginning 1 November 2002 extending through 15 December 2002.

Sub Contracting Plan: The following subcontractors included in the estimate: PD - Pile Driving Subcontractor LS - Landscaping Subcontractor

Site Access: The Joso Disposal Site is Located along the Southern Shore of the Snake River between River Miles 56.5 and 56.8. It is assumed the Site is accessible without further dredging requirements.

Construction Methodology: The construction methodology is standard marine and civil contruction.

Conditions: This work will take place during Summer through Winter months. The anticipated types of soil to be incountered are sand/silts/gravels/cobbles. The use of Clamshells and Scows has been considered, due to the anticipated existence of silt type materials within the Confluence areas. Considerations for delays due to traffic, and coordination efforts have been accounted for within the effective working time. No adverse weather conditions other than normal winter work weather has been assumed.

Equipment/Labor Availability & Distance Traveled: Equipment and Labor is available within a 100-mile radius which includes the cities of Richland, Pasco, Kennewick, Washington. Marine floating plant for dolphin construction is available from the Portland, Oregon and Vancouver, Washington area, approximately 275 miles distance.

Environmental Concerns: Turbidity monitoring will be required during the dredging operation. Sieve analysis testing for course grained and fine grained materials will be required for determining location of disposal area to use. No overflow will be allowed.

Contingencies: No Contingency

Profit: 9.26% profit developed using the weighted guidelines method.

Effective dates for:
Labor: General Decision Number WA990001, Modification #1 dated 3/1/99.
Equipment: NAT99A - EP 1110 - region 8, Jun99
99 Labor and Equipment Rates used as Requested by Project Manager Jack Sands
to correspond with other estimates developed for DMMP/EIS.
crews: USNBEN - Nat'l crews database-A - eff. Jan96
