Acknowledgments

This effort to assist the Lead Agent Office in determining how they might best measure the performance of TRICARE in Region 6 is dedicated to all of the beneficiaries who utilize the Military Health System and depend on us as healthcare professionals to meet their needs. I attribute much of the value of this project to the support provided me by the staff of the Lead Agent Office and the Executive Team who gave me free access and information critical to the understanding of their operations. I would also like to thank Lieutenant Paul Toland and Major Troy McGilvra for their assistance with data collection as well as Captain Barna Lambert for her assistance in content analysis. I gratefully extend thanks to the entire staff of TRICARE Southwest for giving me a welcome place to call home during my residency. Their willingness to share, to assist, and to create a meaningful residency is much appreciated. And a special thanks to my preceptor Colonel Mark Loper, in whom I witnessed incredible talent and energy to reconstitute the professional performance and direction of the Lead Agent staff, MTF Commanders, and Contractor through leadership, collaboration, and visionary management. His compelling and unselfish desire to contribute to the continuous learning of Baylor students both past and present will long be remembered. Finally, I wish to thank my wife Gigi for her patient understanding and positive, encouraging support. These past two years of challenges, learning, and accomplishments would not have been possible without her help. Thank You.

Abstract

The Military Health System's (MHS) benefit program, TRICARE, is administered through a direct care system supported by a civilian network via 12 regional Managed Care Support Contracts (MCSCs). Lead Agents, whose offices serve not only to oversee MCSC performance but also to manage the healthcare benefit program for MHS beneficiaries, monitor these regional contracts. As such, they are inundated with numerous metrics, many of which are not optimal for strategic management. This graduate project identifies the critical performance indicators for the Region 6 Lead Agent Office (TRICARE Southwest) through a comparative analysis of similar health plans.

Using a quantitative decision-making tool, known as the JUDGE (Judging Utility: a Decision Generator and Evaluator) Model, the performance measurements of TRICARE Southwest were compared with those of TRICARE Northwest and PacifiCare of Texas. Critical performance indicators were identified for three core domains: health status, operations/member services, and cost accountability. An analysis provides the executive staff of TRICARE Southwest recommendations to assist in developing an optimal performance measurement system for Region 6. The critical performance indicators identified should aid leaders in determining the "health" of the health plan.

Identifying the Critical Performance Indicators for the TRICARE Lead Agent Office, Region 6

Introduction

The objective of this Graduate Management Project (GMP) was to conduct an analysis of the performance measurement process at the office of the Lead Agent, TRICARE Southwest, Department of Defense (DoD) Health Services Region (HSR) 6. "The Lead Agent coordinates the delivery of health care and integrates the capabilities of the military treatment facility with those of the contractor's network" (Johnson, 1996). In order to accomplish this, the Lead Agent staff monitors a plethora of metrics in overseeing the Managed Care Support Contract (MCSC) as well as metrics surrounding the direct care system. For the TRICARE Program to be effectively and efficiently managed, it was imperative that the proper indicators be identified and categorized by core domain for not only operational management but also benchmarking capability. The Regional Executive Council (REC) are arguably the primary stakeholders for the Lead Agent, and their interests were considered in the performance measurement process. Furthermore, future Military Health System (MHS) rightsizing will likely involve Lead Agent consolidations that will necessitate a streamlined methodology of continuous quality improvement and a performance-based management system.

Conditions Which Prompted the Study

In March 1995, the MHS began implementation of DoD's managed care program, TRICARE. Twelve HSRs were established in the Continental United States (CONUS) in each of which a MCSC would be awarded. These MCSCs would supplement the care delivered by the uniformed services' medical treatment facilities (MTFs) in providing healthcare to beneficiaries of the Civilian Health and Medical Program of the Uniformed Services (CHAMPUS). As of June 1998, all DoD CONUS HSRs are operating a MCSC to provide care to their beneficiaries. Lead Agents are responsible for MHS oversight of the MCSCs and have a variety of associated responsibilities. In November 1995, the Office of the Assistant Secretary of Defense (Health Affairs) (OASD) (HA) provided the Lead Agents, through the Service Surgeon Generals, guidelines "designed to clarify Lead Agents' roles without being prescriptive" (U.S. Department of Defense, 1995). Included in these guidelines was the charge to "participate in MHS metric standardization of data to be reported/used" (U.S. Department of Defense).

One month later, senior staff members of OASD(HA) formulated a series of performance metrics that ultimately led to the MHS Performance Report Card initiative. In September 1998, the MHS Performance Report Card initiative was replaced by the TRICARE Operational Performance Statement (TOPS). TOPS is

"both a statement and an evaluation tool used by the leadership and staff of the TRICARE Management Activity (TMA) and the OASD-HA to get a snapshot of the performance of the MHS at quarterly intervals" (TRICARE Management Activity, 1998). The TOPS is not, however, designed to provide the Lead Agent with management feedback for regional improvement activities (Constantian, A., personal communication, October 19, 1998).

Each MCSC specifies certain management reports to be provided to the government by the contractor, but these metrics are not standardized among the Regions. With TRICARE fully implemented, it is critical that the Lead Agents establish and monitor those performance indicators that facilitate effective decision-making. A literature review coupled with an analysis of the management indicators available to the Region 6 Lead Agent and those used by comparative organizations will help identify the critical performance measurements needed for optimal health plan oversight. The recommendations could potentially serve as a template for those TRICARE Lead Agents just beginning managed healthcare delivery or for consolidated Lead Agents.

Statement of the Problem

Lead Agent offices are inundated with a variety of metrics generated both internally and externally. As they face reduced resources, those in leadership positions must be armed with a clear understanding of the critical indicators to be monitored. The question posed is: what performance measurements should be generated and monitored for the effective management of TRICARE in Region 6? This involves identifying the performance indicator candidates, categorizing them based upon Lead Agent core domains, verifying the quality, accessibility, and timeliness of the data, determining the indicators' strategic link, assessing the value of the indicators to stakeholders, and specifying the recommendations.

Literature Review

Performance measurement in the healthcare setting refers to the use of process measures and outcomes to understand organizational performance and to affect positive change to improve care (Nadzam & Nelson, 1997). While the performance of hospitals has been measured for some time by various organizations, health plan accountability in the managed care setting is much newer (Spoeri & Ullman, 1997). A common term used to denote published summaries of plan performance for a specified period of time is "report card." A report card can

provide "information about clinical outcomes, cost-effectiveness, and organizational performance in an era when healthcare organizations are competing for marketshare and consumers are demanding to be informed about their healthcare providers" (Slovensky, Fottler, & Houser, 1998).

A large number and variety of organizations produce health plan report cards for three principal user groups: purchasers, consumers, and health plans (Allen & Rogers, 1996). Employers desire health plan quality information to assess the value that they are receiving for their expenditures on employee and retiree healthcare benefits. Report cards assist consumers in evaluating the various available health insurance options. Finally, health plans can use the information to assist in continuous quality improvement (CQI) efforts (Scanlon, Chernew, Sheffler, & Fendrick, 1998).

While in many cases the report card initiatives in the commercial sector have been voluntary responses to a perceived public or employer desire for comparative data, they are increasingly accomplished with an underlying goal of accreditation. The National Committee for Quality Assurance (NCQA) and the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) are likely the most reputable accrediting organizations with national performance measurement systems. The NCQA's Health Employer Data and Information Set (HEDIS)

originated in 1989 by a coalition of employers and insurers seeking to establish standardized measurements for health plan comparison. JCAHO's initiative, Oryx, was introduced in February 1997 and allows organizations to build their own report cards (O'Malley, 1997).

Regardless of who develops them, report cards typically compare plans on one or more of the following types of information: "access to care, use of services, clinical indicators of quality such as immunization rates and surgical outcomes, measures related to finances and administrative efficiency, information on costs, and a variety of patient-derived measures including complaint data and results from member satisfaction surveys" (McGee & Knutson, 1994). The balance between administrative and clinical information included largely depends upon the intended users of the report card. As a result, those who develop report cards should employ a sound technical approach to measurement (McGee & Knutson).

Issues to consider when establishing the performance measurement system are "examining the appropriateness and feasibility of measures being considered for inclusion in report cards, standardizing definitions and formulas, determining sampling strategies and risk adjustments to be made, identifying limitations in the data, and discussing ways to avoid misinterpretation" (McGee & Knutson). Furthermore, health plans

must avoid focusing their resources solely on those items measured at the expense of other quality improvement activities that might be of greater importance to their own system and population needs. This necessitates that management personnel maintain a "big picture" view of the corporate environment (McGee & Knutson).

The literature identifies several other factors to consider as well when establishing performance measurement activities. In their article "Developing a Corporate-Level Performance Assessment System," Laffel, Thompson, & Sparer (1995) describe a medical center's experience in establishing a report card. They found a major issue to be considered is the tradeoff between brevity and comprehensiveness. This is certainly germane for health plans also as they evaluate the extensiveness of their metrics. Alsever, Ritchey, & Lima (1995) found that for the Sisters of Charity Healthcare System to demonstrate value in a report card system, clear goals had to first be identified while recognizing that "the automation of data collection and the ability to quickly analyze and trend data are critical to quality improvement."

"Health plans increasingly realize that quality management, including performance reporting, is critical to their competitive success" (Heinen, Peterson, Pion, & Leatherman, 1993). While Jackson & Kroenke (1997) indicate that competition

is a driving force only for non-Federal health care systems, recent governmental activities indicate otherwise. Increased Congressional interest in the MHS has resulted in not only numerous General Accounting Office studies on cost-effectiveness as compared to civilian health systems, but also the initiation of demonstration projects such as TRICARE Senior Prime and the Federal Employees Health Benefits Plan 65 (FEHBP-65). Without a doubt, leaders of the MHS' managed care program, TRICARE, must recognize the necessity of performance measurement processes.

Fundamental to their success will be the regional Lead Agent staff's ability to benchmark their performance indicators. Benchmarking can be defined as "the continuous process of measuring products, services, and practices against the toughest competitors or those companies recognized as industry leaders" (Patrick & Alba, 1994). For Lead Agents, these comparisons should not only include the federal healthcare industry leaders but also civilian health plans that are increasingly becoming competitors of the MHS. Numerous studies (Gordan, 1996; Jordan, Straus, & Bailit, 1995; Joshi, 1994; Patrick & Alba, 1994) highlight the benefits of benchmarking in healthcare and provide lessons learned from previous initiatives.

"As the Department of Defense transitions to a capitated health care system modeled after managed care organizations, assessment and accountability of system effects on the quality

of health care delivery are critical" (Jackson & Kroenke, 1997). This challenge is exacerbated by the primary readiness mission of the MHS (Paul, 1997). In order to appropriately define the critical performance indicators, the Lead Agent executive staff "must view the reporting process as important from a strategic perspective, and establish processes and allocate resources to produce a report in an efficient and cost-effective manner that will meet the information needs of key stakeholders" (Slovensky et al, 1998).

Purpose

The purpose of this study is to identify the critical performance metrics to support executive decisions in the management of TRICARE Southwest. As suggested in the literature review, this will involve: assessing the performance indicators currently in use, exploring the quality improvement initiatives of other federal as well as civilian health plans, determining the interests of the executive management and key stakeholders, verifying the capabilities for collecting quality, accessible, and timely data, and recommending a performance measurement system for establishment at the Lead Agent Office, DoD HSR 6.

Methods and Procedures

The strategy for accomplishing this GMP involved naturalistic inquiry, qualitative data collection, and content analysis using a decision-making tool (Patton, 1989). This approach provided the best avenue for ensuring a flexible process for the identification of a value-added performance measurement system. Naturalistic inquiry involved the observation of internal and external Lead Agent Office operations (e.g. the Regional Executive Council meetings, the MCS Contractor's Program Management Reviews, and the Lead Agent staff's strategic planning sessions) and the investigation of two other managed care organizations' performance measurement activities. The qualitative data collected would then be systematically compared, using a decision-making tool, to determine the optimal performance indicators.

Data Collection

The existing management metrics for TRICARE Southwest were obtained through a variety of sources. This included interactions with Lead Agent staff members, involvement with the contractor's Program Management Review meetings, and participation in the Lead Agent staff's strategic planning sessions. This effort was timely as the Office of the Region 6 Lead Agent underwent reorganization in Winter 1998-99, and new

leadership sought opportunities for improvement under a visionary management framework.

There were numerous metrics gathered, and all were categorized by description, point of contact, source, and frequency of monitoring. The Contract Data Requirements Listings (CDRLs) specify reports and metrics that the Managed Care Support Contractor is required to submit to the Government. Of the hundreds of CDRLs originally identified for contract monitoring, the Lead Agent staff has narrowed the necessary regional submissions to 63, which were included in the study. Over 180 metrics reviewed through the Program Management Review were also catalogued in the list of existing measurements. Finally, the metrics established for the TRICARE Senior Prime Program were included. These metrics were identified by the TRICARE Senior Prime Quality Council as the performance indicators for their health plan. The listing of existing metrics for TRICARE Southwest is identified in Appendix A.

In order to provide an appropriate comparison, the performance measurement activities of the TRICARE Northwest Lead Agent Office (HSR 11) and a local civilian health plan, PacifiCare of Texas, were also selected for assessment. Region 11 provided an example of another DoD Lead Agent's approach with the same MCS contractor. Furthermore, TRICARE Northwest was a more mature region and had more experiences to draw upon. Their

metrics are listed in Appendix B and include the metrics supporting their "Border to Border Goals and Objectives" and selected ones from the Region 11 Program Management Review. PacifiCare served as an example of another plan's activities within the same geographical region. As a non-governmental health plan, it also facilitated some other unique comparisons. PacifiCare's metrics are included in Appendix C and include metrics that reflect their for-profit status.

Once the existing metrics for TRICARE Southwest, TRICARE Northwest, and PacifiCare were collected, the second step was to determine their candidacy as critical performance indicators for TRICARE Southwest. All metrics were considered as candidates unless one of the following conditions applied: (1) the identified measurement was not actually a metric (e.g. a narrative report such as a network provider listing); (2) the measurement was an MTF, FHFS, or external-organization specific metric (e.g. an operating profit margin); or (3) the measurement was not a metric for executive level management consideration (e.g. a total number of surveys processed). When there was any uncertainty, the point of contact for the metric was queried regarding the potential candidacy. These determinations are included in the respective metrics' listings in appendices A, B, and C.

The next step in the critical performance indicator identification process was to determine the core domains or performance drivers for TRICARE Southwest and to verify primary stakeholder acceptance. The Executive Staff, during a strategic management off-site meeting, identified the organization's 3 core domains: health status, operations/member services, and cost accountability. Subsequently, the Executive Staff drafted a goal for each domain. The 3 domains and their goals were clearly supported by the agenda of a primary stakeholder in the performance measurement process, the Regional Executive Council (REC).

The REC's membership is comprised of the MTF Commanders within the Southwest Region, to include 13 Air Force facilities, 4 Army facilities, and 1 Navy facility. The REC meets on a quarterly basis and discusses issues facing the TRICARE program. As a part of this process, they define the Critical Initiatives for the Lead Agent staff to target as opportunities for performance improvement activities. The most recent REC meetings were held in November 1998 and February 1999, during which their discussions and decisions supported the core domains and goals for regional performance measurement. Members of the REC agreed that the role of the Lead Agent's Office is not solely to monitor contract compliance, but to serve as a partner with the Managed Care Support Contractor in an effort to build

and maintain the best healthcare system possible. As such, these key stakeholders expect the Lead Agent staff to identify and track the fundamental measurements for operating a successful, regional healthcare delivery system.

In this effort, the next step was to organize the potential critical performance indicators by the 3 core domains and specific metric types. This step is important to ensure that the final metrics identified, following the content analysis, can assist the Executive Staff in determining, for each goal, potential objectives that are definable and measurable. This also allowed the combination of metrics from the 3 organizations, to eliminate redundancy and produce a consolidated list of critical performance indicator candidates. Table 1 depicts the 14 resulting categories for content analysis.

Table 1

Categories for Content Analysis

Health Status (Appendix D)	Operations/ Member Services (Appendix E)	Cost Accountability (Appendix F)
Utilization Management	Provider Services	Enrollment Based Capitation
Quality Management	Customer Service	Resource Sharing
Case Management	Customer Satisfaction	Claims Processing
Health Care Information Lines	Enrollment	Pharmaceuticals
Clinical Indicators	Access to Care	

Content Analysis

The next stage in the process of identifying the critical performance indicators for TRICARE Southwest involved the use of a quantitative decision-making tool, known as the JUDGE (Judging Utility: a Decision Generator and Evaluator) Model. The JUDGE model provides an analytical method of making a decision and provides a mathematical best choice. However, the user of the model may have to consider additional factors before making the final decision. Using the JUDGE Model allowed the potential performance indicators identified for Region 6 to be compared with those of TRICARE Northwest and PacificCare of Texas, by core domain and metric type.

The first step of the model was to specify the attributes of competing alternatives. In this case, that involved specifying the important attributes of a good metric. Seven attributes were used to describe the potential metrics: data quality, data accessibility, data timeliness, data actionable, strategic link, external benchmark, and stakeholder value.

The attributes used were identified in the literature (Gundacker, 1998; National Performance Review, 1997; Roadman, 1999) as fundamental characteristics of good performance measurements. Data quality, listed first, refers to the accuracy of the metric's source data. Secondly, the data's accessibility indicates the ease or difficulty in obtaining the

metric's source data. The currency of the metric's source data is assessed by the third attribute, data timeliness. The fourth attribute, termed data actionable, refers to the meaningfulness of the metric and the degree to which it facilitates executive level decision-making. The fifth attribute identified as strategic link indicates whether or not the metric is aligned with the TRICARE Southwest's mission, vision, and goals. Sixth, external benchmark evaluates the proliferation of the metric among the 3 organizations. Finally, the seventh attribute, stakeholder value, compares the metric to the critical initiatives and key interests of TRICARE Southwest's primary stakeholder, the REC.

The second step of the model was to rate the attributes. Each attribute was rated on a 9-point scale. The bipolar relative rating scale is anchored at each point, with the measurement of 1 representing extremely undesirable and 9 representing extremely desirable. While none of the attributes are undesirable, their significance in the identification of the critical performance indicators is scored relative to one another.

Ratings were then recoded and rescaled (step three) so that a neutral point of zero could be obtained. This was accomplished by subtracting 5 from each of the ratings previously assigned on the 9-point scale. The ratings were then

rescaled by multiplying the recoded ratings by a scaling factor of 5.56. This factor is used so that the rescaled ratings sum to 100. The same initial and recoded ratings were included in all 14 JUDGE Model calculations that are found in Appendix G.

Step four was to identify the alternatives. There are a multitude of metrics in the healthcare industry. Again, the alternatives were limited to those critical performance indicator candidates that are: (1) already used at TRICARE Southwest, (2) used at TRICARE Northwest, and (3) used at PacifiCare of Texas. Writing the alternative equations in linear form produces the following:

■ Alternative A (Current Metric at TRICARE SW):

$$Y^{(1)} = {}_1W_1V^{(1)} + {}_1W_2V^{(2)} + \dots + {}_1W_{10}V^{(10)}$$

■ Alternative B (Metric at TRICARE NW):

$$Y^{(2)} = {}_2W_1V^{(1)} + {}_2W_2V^{(2)} + \dots + {}_2W_{10}V^{(10)}$$

■ Alternative C (Metric at PacifiCare of TX):

$$Y^{(3)} = {}_3W_1V^{(1)} + {}_3W_2V^{(2)} + \dots + {}_3W_{10}V^{(10)}$$

where Y is the alternative, w is the attribute's utility, and V is the rescaled rating.

Step six was to judge each attribute's utility in relation to each attribute. Table 2 indicates the method used in determining the utility of each attribute:

Table 2

Methods Used to Determine Attribute Utility

Attribute Number	Attribute Description	Method Used For Determining Utility	Source
1	Data Quality	Data Review	LA Info Mgt
2	Data Accessibility	Data Review	LA Info Mgt
3	Data Timeliness	Data Review	LA Info Mgt
4	Data Actionable	Data Review	Resident
5	Strategic Link	Exec. Interaction	Resident
6	External Benchmark	Data Review	Resident
7	Stakeholder Value	REC Review	Resident

The utility for attributes 1-3 was based on the responses of the Lead Agent's Chief of Data Quality and Analysis, Captain Barna Lambert, as she investigated the metrics. For attributes 4-7, the utility of each attribute was judged using a subjective, "best estimate" method based upon the Resident's interactions with the Executive Management Team, Lead Agent Staff Members, the Regional Executive Council, and representatives of the two external organizations. This involved assessing the importance of the metric to the organization based upon its need in executive level decision-making activities.

Step seven was a comparison of alternative decision indices. Calculating a weighted composite score for the alternatives for each attribute allowed a comparison of alternatives. The weighted composite score was calculated by multiplying the valence for each attribute by the weights for each alternative.

Evaluation of the decision components was the eighth step. Appendix G shows the final attribute scores for each alternative. After reviewing these attributes it was decided that no adjustment to ratings or weighted values would be necessary. The final step of the model is to determine the conclusion. Based upon the JUDGE model analyses, scores were calculated for each metric type and are also included in Appendix G.

The Results

Health Status

JUDGE Model calculations under the health status core domain were accomplished for utilization management, quality management, case management, clinical indicators, and healthcare information lines. For all five metric types, TRICARE Southwest's method scored highest. With the exception of healthcare information lines (which PacifiCare data did not include), PacifiCare's method scored second for each of the metric types. Several explanations exist for these findings.

The success of the TRICARE Southwest performance indicators for health status is largely due to the metrics that were included from the TRICARE Senior Prime demonstration. The utilization management, quality management, and case management metrics that are being used with the Senior Prime population

should also be considered for use with the Prime population. This would mirror the practice used by PacifiCare, whereby metrics examined for the senior population are also measured for their commercial product. Furthermore, it should be noted that the clinical indicators of PacifiCare outsourced those of TRICARE Southwest on the attributes of data actionable, strategic link, and stakeholder value. However, the pervasive lack of quality, accessible, and timely MHS clinical data from the TRICARE Southwest perspective largely prohibits PacifiCare's clinical indicators from usage at the Region 6 Lead Agent.

While TRICARE Northwest certainly has metrics measuring health status, their minimal representation in the metric types examined resulted in lower scores. Since TRICARE Northwest also includes a TRICARE Senior Prime demonstration, it is likely that they actually have more clinical metrics than were included in this study. Finally, their measurement for the healthcare information line is identical to that used by TRICARE Southwest, since the metric is a CDRL of the MCSC, Foundation Health Federal Services.

Operations/Member Services

JUDGE Model calculations under the operations/member services core domain were accomplished for provider services, customer service, customer satisfaction, enrollment, and access

to care. The results for this core domain were mixed across the three organizations, and there were some noteworthy trends.

TRICARE Southwest scored highest for both provider services and customer service. The importance of examining network adequacy coupled with issues such as provider satisfaction highlighted Region 6's efforts. Measuring customer service metrics are included in the quarterly performance management review of the MCSC, and emphasize compliance with contractual standards. PacifiCare, however, best measured customer satisfaction, through a process examining member complaints.

TRICARE Northwest scored highest for measuring enrollment as well as access to care. While the comprehensive list of metrics surrounding enrollment is similar between Regions 11 and 6, TRICARE Northwest has carefully extracted those specific performance measurements that are worthy of executive oversight. This resulted in higher weighted composite scores for their enrollment indicators. In measuring access to care, TRICARE Northwest excels by examining not only the civilian network compliance with access standards, but also the performance of the regional MTFs or the direct care system. This provides Region 11's executive team with a snapshot of the entire region's performance.

Cost Accountability

JUDGE Model calculations under the cost accountability core domain were accomplished for enrollment based capitation, resource sharing, claims processing, and pharmaceuticals. TRICARE Northwest performance indicators scored a perfect 100 for three of the metric types: enrollment based capitation, resource sharing, and pharmaceuticals.

Enrollment based capitation (EBC) and resource sharing are reflective of relatively new business practices for the MHS. In fact, EBC has not yet been implemented as a funding methodology for the MHS. Anticipating this future budgeting methodology, TRICARE Northwest monitors performance indicators both inter- and intra- regionally to assess their health plan's financial condition. While TRICARE Southwest is aware of resource sharing target savings versus actual savings, TRICARE Northwest monitors this regularly as a formal objective. Moreover, their executive staff also monitors regional pharmaceutical costs through inventory levels, utilization summary, and other health insurance off-sets. Data from PacifiCare did not indicate any monitoring activity surrounding pharmaceuticals.

Claims processing metrics for TRICARE Northwest scored just higher than those of TRICARE Southwest. Claims processing has increasingly become an area of focus for the MHS, and as a result, are receiving additional attention by performance

measurement activities. Areas of emphasis include claims' inventory levels, electronic claim volumes, and top five denial reasons. Two of TRICARE Northwest's "Border to Border" objectives are targeted at improving claims processing activities.

Limitations

As with any research effort, limitations of the study did exist. The procedures used in the data collection and content analysis phase required some amount of subjective interpretation by the resident and organizational points of contact. Attempts were made, however, to reduce the influence of subjectivity by establishing decision-making criteria and using the quantitative JUDGE Model. Furthermore, Regions other than 6 and 11 might be able to benefit from this GMP effort, but the recommended performance indicators are specific to Region 6 and reflect the perspective of TRICARE Southwest. Those Regions just beginning healthcare delivery may be slow in establishing the processes to collect the appropriate data and will also need to measure other metrics associated with a new MCSC.

Discussion

Clearly, the findings of this research provide some applicable information for Office of the Lead Agent. Comparing

TRICARE Southwest with TRICARE Northwest and PacifiCare of Texas yielded both similarities and differences that are noteworthy. Furthermore, the key characteristics of the critical performance indicators spotlight the fundamental requirements of appropriate health plan metrics. Finally, there are challenges that must be faced and, more importantly, addressed before an appropriate performance measurement system can be implemented. These issues (similarities/differences, key traits, and challenges) are addressed in detail below.

Similarities and Differences

As might be expected, the similarities among the three organizations were most often between the two DoD entities. The fact that both Lead Agent Offices work with the same Managed Care Support Contractor results in common CDRLs in many instances. Other similarities noted were the metrics established by TRICARE Southwest for the TRICARE Senior Prime program and the metrics used by PacifiCare for their senior citizen product line, Secure Horizons. This is largely due to the requirements that the Health Care Financing Administration (HCFA) places on health plans for Medicare patients.

The differences among the metrics of the three organizations also highlight some interesting points. PacifiCare of Texas, as a for-profit company, certainly had more

financial measurements than the two federal organizations. These measurements not only addressed cost accounting but also revenue management. Additionally, it should be noted that PacifiCare largely monitored the same metrics for both their commercial and senior product lines. Whereas, TRICARE Southwest segregates their existing performance measurement processes. Finally, TRICARE Northwest grouped their metrics by the organization's goals and objectives, while TRICARE Southwest does not have an existing system in place for indexing the metrics utilized.

Key Traits

Regardless of the source organization, the critical performance indicators identified possess some key traits that contribute extensively to their effectiveness as management metrics. For those metrics that address the health status of the population, an important feature was a focus on conditions that are principally treatable through modification of health behaviors. This provides the organization with targeted opportunities for health promotion and preventive medicine efforts with the goal of improved patient outcomes. Examples include smoking cessation, cardiovascular exercise, and nutritional education for health plan membership. Another focus of health status metrics is the utilization of health services.

The organization can use this information to consider the deployment of demand management techniques as well as to determine the acuity level of their health plan membership.

The critical performance indicators for operations and member services also have some distinguishing features. Compliance with standards is important for ensuring access to care, and it also impacts customer satisfaction levels. Member services such as toll-free telephone lines must be monitored rigorously to ensure that customers receive timely, accurate information. In addition, enrollment processes must be clearly defined and efficient, not only to expedite eligibility verification but more importantly to provide health plan members with the tools needed to access health services. Finally, provider-focused metrics must address credentialing processes and network adequacy.

Cost accountability has become increasingly important for Lead Agent Offices. With the potential implementation of Enrollment Based Capitation, the fiscal state of the region must be assessed proactively so that proper arrangements are established with the Managed Care Support Contractors. TRICARE Northwest has established metrics to accomplish this, providing true indicators of a critical performance area. Resource sharing opportunities must also be identified and evaluated to determine potential savings. Another area that has drawn

national attention for TRICARE, more so than civilian health plans, is claims processing. Several critical performance indicators for claims processing should be monitored regularly to maintain productive relationships with civilian network providers.

Challenges for Implementation

Undoubtedly, there are some formidable challenges for TRICARE Southwest as they seek to establish an effective performance management system. Issues surrounding data quality should be addressed regionally, just as they currently are at the DoD level. It is also vital that the Lead Agent Office hold the entire health system accountable and not solely the contracted portion. Moreover, for a performance measurement system to be implemented, TRICARE Southwest's executive team should focus its sights on the strategic landscape they are facing. This requires that they identify the internal organization's strengths and weaknesses and the external environment's opportunities and threats.

From discussions with and actions of MHS leadership, it is clear that several concerns surround data quality. The usage of multiple information systems, that are often incompatible, hamper data extraction. Issues surrounding the uncertain accuracy of the data that is collected give rise to speculation

among decisionmakers. The lack of standard business practices among the three services (Army, Navy, and Air Force) further exacerbates the problem. To address these and other data quality concerns, national MHS organizations, such as TMA, are creating teams focused on data management. A continuous improvement approach will be necessary to navigate this complicated terrain, and TRICARE Southwest should plan to address these hurdles from the regional perspective.

A second major challenge for the Lead Agent Office in establishing performance measurement processes is the disparity that exists between the MTFs and civilian provider networks. While Lead Agent staff members aggressively monitor the MCS Contractors performance, MTFs are not held accountable for the same results. This is due to the lack of command and control authority of Lead Agents over the MTFs in TRICARE Regions. The three services maintain authority over their respective facilities. This presents a tremendous obstacle for effective and efficient operations from a regional health plan perspective. Notwithstanding the current MHS structure, Lead Agent Offices, such as TRICARE Southwest, can seek to identify MTF performance deficiencies through a systems approach and through tactful, diplomatic relationships improve overall MHS performance.

Finally, TRICARE Southwest must build upon clearly defined goals and objectives as they address performance measurement activities. The organization currently has three overarching goals: (1) optimize the health status of the regional population; (2) optimize member-focused services for the regional population; and (3) optimize fiscal performance in the region. The critical performance indicators identified for each of the 3 core domains and the aforementioned related goals should assist the executive staff in determining measurable objectives. Once established, these foundational elements should provide TRICARE Southwest with the basis for an effective performance measurement system.

Conclusions and Recommendations

As the Region 6 Lead Agent Office prepares for future MHS rightsizing and potential restructuring, a well established performance measurement system that monitors the critical performance indicators will provide a mechanism for executive management decision support. Through a comparative analysis of similar health plans, the critical indicators have been identified for each of the core domains. Appendix H provides a matrix that lists, by their core domains, the critical performance indicators identified through the JUDGE Model calculations and provides executives a tool to indicate

applicability across the TRICARE Southwest's "Family of Health Plans."

This GMP wholeheartedly concurs with the fundamental elements required for an effective performance measurement process as identified in 1997 by the National Performance Review. The central findings of the "Benchmarking Study Report" were:

- Leadership is critical in designing and deploying effective performance measurement and management systems.
- A conceptual framework is needed for the performance measurement and management system.
- Effective internal and external communications are the keys to successful performance measurement.
- Accountability for results must be clearly assigned and well understood.
- Performance measurement systems must provide intelligence for decisionmakers, not just compile data.
- Compensation, rewards, and recognition should be linked to performance measurements.
- Performance measurement systems should be positive, not punitive.
- Results and progress toward program commitments should be openly shared with employees, customers, and stakeholders.

The executive staff of TRICARE Southwest should consider these tenets of quality management as they further develop their performance measurement processes.

Without a doubt, the MHS will continue to face budgetary pressures. Identifying the critical performance indicators for regional management of TRICARE is simply the beginning of the continuous improvement efforts that should be sought. Future research should be targeted toward improving the overall operations of the TRICARE program through trend analyses and business practice enhancements. Furthermore, additional studies to determine *specific* benchmarking opportunities with civilian health plans would benefit the MHS as it seeks to implement the industry's best practices.

The Lead Agent Office of Region 6 is well positioned for a dynamic future. In their quest to optimize MHS performance, the established core domains and goals provide targets to guide the arrows of effort. A comparison with similar health plans allowed the identification of critical performance indicators to be monitored. Through consistent assessment activities, TRICARE Southwest can translate vision into reality and truly become the premier MHS health plan.
