Military Airlift: C-17 Aircraft Program

Summary

The C-17 Globemaster III is a long-range cargo/transport aircraft operated by the U.S. Air Force since 1993. Congress approved development of the aircraft in the late 1970s, when it was recognized that the Air Force did not have enough airlift capability. In 1981, the McDonnell Douglas C-17 emerged as winner of a competition with Boeing and Lockheed to develop a next-generation aircraft to replace C-130s and C-141s.

Full-scale development of the C-17 got underway in 1986, but technical problems and funding shortfalls delayed the program, leading to slipped schedules and increased costs. Despite those difficulties, the C-17 has retained broad congressional support and enjoys strong Air Force and Army backing. Defense officials view the C-17 as essential in the post-Cold War environment, because of its ability to fly long distances with large payloads yet still use smaller bases in remote areas.

The C-17 first flew in 1991, about a year later than originally scheduled. Deliveries began in 1993, and in January 1995, the Air Force declared the aircraft fully operational. C-17s have been successfully used in Bosnia, Kosovo, Afghanistan, Iraq, and other operations.

Production problems in the late 1980s raised questions about the possibility of more cost-effective alternatives. In April 1990, Defense Secretary Cheney reduced the projected buy from 210 to 120 planes. In late 1993, the Department of Defense (DOD) gave the contractor two years to solve production problems or face termination of the contract, with airlift shortfalls to be filled by modified commercial transport planes or existing military airlifters.

By the mid-1990s, the program's earlier difficulties had been largely resolved, although some questioned the number of C-17s to be procured. In 1996 DOD approved plans to order 80 more C-17s for a total of 120 aircraft — increased in late 1998 to 134. In June 2001, DOD announced its decision to acquire 137 C-17s, which would bring the Air Force's million-ton-miles-per-day capability to 45.3. Through FY2004, some \$46 billion was provided for the C-17 program, which would cost about \$60.1 billion for development and procurement of 180 aircraft, as estimated in June 2004. The current plan is to buy 180 aircraft, though Air Force officials would like 222.

The C-17 program is at the center of a number of airlift issues that confront policymakers. These issues include, but may not be limited to airlift needs and requirements, cost and budget, and industrial base issues. Alternatives to the C-17 program must also be weighed.

Military Airlift: C-17 Aircraft Program

Introduction

Background

The Air Force's C-17 Globemaster III is a long-range cargo/transport aircraft manufactured by Boeing (since its acquisition of McDonnell Douglas in 1997). Powered by four turbofan engines made by Pratt & Whitney, the C-17 is expected to meet U.S. strategic (long-range) airlift requirements, complementing the tactical (shorter-range) airlift capabilities of the C-130 Hercules cargo/transport planes built by Lockheed-Martin. The C-17 can carry some 169,000 lbs of outsize or oversized cargo (e.g., Abrams tanks and Apache helicopters) and can operate from smaller runways than the larger C-5 Galaxy.

The program had a difficult time winning the support of Congress in the late 1970s. The main hurdle at the program's outset was that the Air Force had not clearly demonstrated a need for additional strategic airlift capacity. Funding was finally approved to begin development in FY1981. Just when the program was getting under way, however, DOD decided in early 1982 that the airlift shortfall was too urgent to await development of a new plane and that it would also be better to buy some planes already in production. Congress approved funds in the FY1983 budget to purchase 50 additional C-5 cargo planes (made by Lockheed Martin) and 44 new KC-10 Extender aerial refueling aircraft (then made by McDonnell Douglas) to make up part of the airlift shortfall in the shortest time possible.¹ Since the Air Force wanted to develop the C-17 as well as to buy additional C-5s, Congress directed the service to develop a comprehensive description of its future acquisition plans. The result was the Airlift Master Plan of September 1983, which compared several alternatives for modernizing the airlift fleet and concluded that the C-17 was the most cost-effective.

Performance Considerations

The Air Force states that the performance characteristics of the C-17 are significantly better than those of other cargo/transport aircraft. The C-17 can land on shorter runways and is more maneuverable on the ground than the larger C-5 or commercial transport planes, such as the Boeing 747, which require much longer and wider runways. That requirement limits the number of available bases, and the number of aircraft that can use a base at any one time (called "maximum on the

¹ The KC-10 is a large aircraft. In addition to 356,000 lbs of fuel, it can carry up to 75 troops and 170,000 lbs of cargo. The KC-10 fleet represents approximately 12% of all of DOD's organic airlift capability. See CRS Report RS20941 for more information.

ground” or MOG by logisticians). In explaining the November 1995 decision to buy another 80 C-17s, DOD officials cited as a critical feature their calculations that eight C-17s could land and offload 3,852 tons per day in a space where only three modified 747s could operate delivering 1,754 tons per day.

The C-17 is also expected to be more cost-effective than its competitors based on projected life-cycle costs. The C-17’s performance in the “reliability, maintainability, and availability evaluation” exercises of July-August 1995 confirmed its supporters’ expectations about operational capabilities with favorable cost implications, in part because fewer people are needed to operate and maintain the aircraft.

As part of the 1993 omnibus agreement between the Air Force and McDonnell Douglas, DOD agreed to change certain contract specifications that were causing design and cost problems. The most noteworthy of these changes included cruise speed reduced from Mach 0.77 to Mach 0.74; maximum payload from 172,200 lb to 169,000 lb; and ferry range from 4,600 nm to 4,300 nm. Air Force General Ronald Fogleman, then head of the U.S. Mobility Command, said these changes did not affect critical operational requirements, explaining that a 3,200-mile mission with a 110,000-lb payload had been established as a goal and that the C-17 would meet or exceed this requirement.

Production and Schedule

The C-17 program has experienced a noteworthy amount of turbulence, and planned purchases and inventories have been increased and decreased over time.

The FY1985 budget included \$129 million to begin full-scale development of the C-17 — then to be produced in a 210-aircraft program. The Airlift Master Plan had projected a requirement for 210 C-17s, with 180 in the active fleet and 30 additional aircraft for backup and spares and for testing and evaluation. The Air Force would also retain 114 C-5s but would turn many of these over to the Air Force Reserve and Air National Guard. By the mid-1980s the C-17 program appeared to be on track, if somewhat behind schedule. Production difficulties later delayed the program further, with slipped schedules and rising development costs. In April 1990, Defense Secretary Dick Cheney reduced the program from 210 to 120 production C-17s, reflecting revised estimates of airlift requirements in view of the collapse of the Soviet Union, as well as domestic budgetary restraints.

The Air Force agreed in December 1993 to buy another 12 C-17s during FY1994- FY1995, but Defense Secretary Les Aspin stated that the contract would end with the 40 aircraft then on order if McDonnell Douglas failed to resolve production and cost problems during that two-year period. In that event, DOD would buy a mix of C-17s and modified commercial transport planes, or C-5 military transports to replace the aging C-141 Starlifter. By accepting the 1993 agreement, McDonnell Douglas incurred a loss of nearly \$1.5 billion on the development phase of the program. In addition, the company agreed to spend \$456 million in process improvements and testing. DOD agreed to provide an additional \$438 million for the program — \$237 million to settle claims with McDonnell Douglas and \$201 million for flight testing.

In November 1995, the Defense Department decided to continue procurement of the C-17 for a total program of 120 aircraft instead of meeting airlift requirements with a mix of C-17s, modified Lockheed C-5s, and Boeing C-33s. The military services argued that additional airlift capacity was critical and that if C-17s were not procured, other less capable cargo/transport aircraft would be needed to make up the shortfall. Most Members of Congress recognized the need for additional airlift, although some questioned the need to buy as many as 80 more C-17s.

In January 1996, the Defense Acquisition Board (DAB) approved plans to buy 80 C-17s (for a total of 120 aircraft) over a seven-year period (FY1997-FY2003) in a multiyear contract that would be less expensive than either single-year buys or multiyear procurement over a longer period (with savings estimated at 5% of a projected program cost of \$18 billion). The Air Force argued that buying the C-17 in six or seven years would provide the planes sooner and more cost-effectively and would avoid funding competition with other Air Force programs after 2003. Critics argued that such a long-term contract could entail financial penalties for reducing annual buys, if budgetary constraints in future years were to force the Air Force to choose between buying C-17s or other aircraft, such as F/A-22 Raptor. On May 31, 1996, the Air Force and McDonnell Douglas (now owned by Boeing) signed a \$16.2-billion multi year procurement contract for 80 aircraft to be produced over seven years.

The first of these 80 aircraft was delivered on August 10, 1998, bringing total deliveries to 41 aircraft. In late 1998, 14 more aircraft were added to planned buy, bringing the planned total to 134 C-17s. By late 2002, the Air Force had taken delivery of 100 C-17s.

In early 2002, Air Force officials said that even more C-17s are needed. Chief of the U.S. Transportation Command, Gen. John Handy said that he wants 222 C-17s to meet the nation's airlift needs.² This is an increase of at least 42 aircraft from the desires of his predecessor. Former head of the U.S. Transportation Command, Gen. Charles "Tony" Robertson testified in April 2001 that he needed 170 to 180 of the aircraft to meet requirements outlined in DoD's Mobility Requirements Study 2005 (MRS-05).³ In August 2002, Boeing was awarded a \$9.7 billion contract to produce an additional 60 C-17s, which would bring DOD's total inventory to 180. This contract is expected to keep the Long Beach, CA production line open until 2008.⁴ The 60 airframes purchased under this contract will cost approximately \$161 million each. Engines and other equipment cost approximately \$25 million per aircraft, bringing the approximate aircraft cost to \$191 million each.⁵

Basing

Active duty C-17s are currently based at Charleston AFB, SC (437th Airlift Wing), and McChord AFB, WA (62nd Airlift Wing). A training unit of eight aircraft is based at Altus, OK (97th Air Mobility Wing). The first C-17 arrived at March Air Reserve Base, CA, on August 9, 2005, and seven more Globemasters are scheduled to be based there. The Air Force plans to base C-17s at six additional bases: McGuire AFB, NJ, Dover AFB, DE, Travis AFB, CA, Elmendorf AFB, AK, Hickam AFB, HI, and an Air National Guard wing at Jackson International Airport, MS.⁶ This basing plan has proven controversial for some Members of Congress.⁷

C-17 in Recent Operations

The C-17 has been used in a number of military operations, including Joint Endeavor (Bosnia) Allied Force (Kosovo), Northern/Southern Watch (Iraq), Atlas Response (Mozambique and South Africa), Enduring Freedom (Afghanistan) Iraqi Freedom (Iraq). Also, the C-17 has been used to support peacekeeping operations, such as delivering cargo to peacekeepers in Darwin, Australia who were preparing to quell the ethnic fighting in East Timor, Indonesia. (1999). C-17s have also been used to support humanitarian and relief efforts. In 1999, for example, C-17s from the 437th Airlift Wing delivered cargo to victims of Hurricane Mitch in Honduras and Nicaragua and, in 2001, they carried federal relief workers and 30,000 lbs of supplies to flood-soaked Houston, Texas.⁸

The C-17 was first systematically employed in a major contingency beginning in December 1995, when U.S. and allied nations deployed peacekeeping forces to Bosnia in support of Operation Joint Endeavor. In the first three months of operations, Air Force mobility forces flew 3,827 missions, carried over 18,539 troops and delivered more than 45,000 short tons of cargo. The C-17 — used to satisfy the Army's need for high-capacity, short distance air transport to move peacekeepers, equipment and outsize cargo from Central Europe to the Bosnia area of operations — flew slightly more than 26 percent of the missions but delivered over 44 percent of the cargo.⁹ Globemaster crews reportedly offloaded cargos of some 165,000 lb in less than 15 minutes.¹⁰ GAO assessment of the C-17's performance during Joint

Endeavor (GAO/NSIAD-97-50) found good news to report. The C-17's mission capable rate was reported to be 86.2 percent, 5 percent higher than the required 81.2 percent. On the other hand, the GAO wrote that the C-17 was not required to perform many tasks which it had previous trouble doing, or could not do during operational testing. These tasks included landing at small austere airfields on short, wet runways, performing strategic airdrops of both troops and equipment, and providing aeromedical evacuation capability.

The C-17's ability to operate from austere airfields in Albania and Macedonia was further demonstrated during the Operation Allied Force in March-June 1999, when C-17s achieved a 96-percent mission-capable rate. In their joint testimony before the Senate Armed Services Committee, Secretary of Defense William Cohen and Chairman of the Joint Chiefs of Staff General Henry Shelton extolled the C-17's contributions to the Kosovo conflict. They said that "...the C-17 was the workhouse of the airlift force, providing for the rapid deployment of critical warfighting and humanitarian materiel." Furthermore, they testified that

Throughout Operation Allied Force, U.S. forces had to overcome many limitations in transportation infrastructure. Poor airport surface conditions in Tirana, Albania, for example, slowed aircraft turnaround times, limited throughput, and slowed the onward movement of forces and humanitarian supplies. Our transportation and other logistic assets proved to be flexible, effective, and efficient in responding to these limitations. In particular, the C-17 made the concept of direct delivery — the strategic air movement of cargo from an aerial port of embarkation to an airfield as close as practicable to the final destination, a reality."¹¹

Air Force officials said that the C-17s high payload capacity, ability to land on short, austere airfields, and its ground maneuverability were the keys to success during this operation.

Almost all of the Air Force's inventory of 50 C-17s were involved in the Balkan operation and the Globemaster flew half of the strategic airlift missions required by the operation."¹² The U.S. Air Force reports that C-17s from Charleston AFB, S.C. had flown 1,092 missions into the theater as of June 29, 1999, with a departure reliability rate of 96 percent. C-17 was also used extensively for intra-theater operations. Twelve C-17s flew 430 intra-theater airlift missions.¹³

¹³ Anthony Cordesman, "The Lessons and Non-Lessons of the Air and Missile Campaign in Kosovo," Center for Strategic and International Studies, Mar. 5, 2000.

The Air Force has consistently praised the C-17's performance in support of Operation Enduring Freedom, the war against terrorism in Afghanistan. Nearly 170 C-5 and C-17 cargo planes have been dispatched to create an "air bridge" to this distant, landlocked theater of operations.¹⁴ C-5 aircraft bring cargo and troops from the United States to staging bases in Europe and the C-17s fly directly to forward operating bases in Afghanistan. C-17s fly from Ramstein Air Base in Germany to Afghanistan, approximately 26 hours each way and 10,000 miles round trip.¹⁵ C-17s have also flown missions from U.S. bases directly to forward operating locations in Afghanistan.¹⁶

While distance is clearly a challenge, overflight, and infrastructure challenges appear to be even more burdensome. Most of the Afghan airfields from which C-17s operate are short (~3,500 feet), and strewn with debris and potholes. Some airfields are nothing more than packed dirt. C-5s cannot operate from these primitive airfields.¹⁷ For security reasons, C-17s offload cargo as quickly as possible (usually with engines running), make unscheduled landings, and fly seemingly erratic routes.¹⁸

In addition to moving personnel and war materiel, C-17s conducted numerous food drops early in the campaign. Beginning on October 7, 2001, the first day of the war, the Air Force began flying two to four food-drop flights per day. From an altitude of 25,000 feet, each C-17 unloaded about 17,000 humanitarian daily rations over Afghanistan.¹⁹

Air mobility operations, as expected, played a significant role in the Iraq war. Reports suggest that airlift operations were largely satisfactory, and that the C-17 airlift aircraft performed well. Air mobility missions accounted for 16,740, or 40%, of the 41,404 sorties (excluding sorties by special operations forces and Army helicopters, and "coalition sovereignty flights") in the war.²⁰ The U.S. Transportation Command reported that by April 10, 2003, it had flown 16,213 air mobility missions

for the war, exceeding the total number of such missions flown in the 1991 Persian Gulf war.²¹

The requirement for U.S. strike aircraft to fly around rather than through Turkish airspace increased aerial refueling requirements because those aircraft now had to fly longer missions. Turkey's decision not to allow the U.S. Army's 4th Infantry Division to attack northern Iraq from bases in Turkey increased airlift requirements because establishing a U.S. ground presence in northern Iraq then had to be done primarily by air. Fifteen C-17 aircraft executed one of the largest air assaults in recent memory, airdropping 1,100 paratroopers from the Army's 173rd Airborne Brigade. To buttress this force, U.S. airlift aircraft transported an additional million pounds of equipment, several M-1 Abrams tanks, and another 1,000 soldiers.

Issues

The C-17 program is at the center of a number of airlift issues that confront policymakers. These issues include, but may not be limited to airlift needs and requirements, cost and budget, and industrial base issues. Also, alternatives to the C-17 program must also be weighed.

Needs and Requirements

The number of C-17s that should be procured is related to the overall airlift requirement, which is typically measured in millions of ton-miles per day (MTMD). In March 2001, the Air Force announced the findings of its Mobility Requirements Study 05 (MRS-05). MRS-05's principal finding was that the goal set by the previous mobility study for an airlift fleet capable of moving 49.7 MTMD of personnel and cargo was inadequate to meet the national military strategy. MRS-05 recommended an airlift fleet capable of 54.5 MTMD. At that time, DOD's strategic airlift capability was approximately 44.7 MTMD, nearly 10 MTMD short of the MRS-05 goal.²² In June 2001, DOD announced its decision to acquire three additional C-17s, which would bring the Air Force's million-ton-miles-per-day capability to 45.3.²³ This increase to 137 Globemasters reduced the gap between and desired and actual airlift capabilities to 9.2 MTMD.

Will the global war on terrorism and other global commitments make this shortfall worse? Many factors suggest a growing need for airlift, and the Air Force began in June 2004 the first "post 9/11" review of transportation requirements. This Mobility Capabilities Study (MCS), once scheduled for completion in March 2005, is now hoped to be completed in October 2005. Some expect that the MCS will

²¹ Chuck Roberts, "C-130 Crews Keep The Supplies Coming," *Air Force News*, Apr. 16, 2003.

²² For more information on MRS-05, see CRS Report RS20915.

²³ Jonathan M. Block, "Officials: Air Force to Procure Three Additional Boeing C-17s," *Inside the Air Force*, June 29, 2001.

project airlift needs closer to 60 MTMD than the 2000 estimate of 54.5 MTMD.²⁴ Others speculate that the MCS will not increase the 54.5 MTMD requirement, because planners know that DOD cannot afford to purchase enough aircraft to provide this amount of airlift.²⁵ Those who hold this perspective imply that the MCS is not an unbiased study of requirements, but a compromise between what is needed, and what can be achieved.

How significant is the current shortfall? Does it jeopardize current and future force projection capabilities? The commander of the U.S. Transportation Command testified that he could not provide the airlift capabilities on the schedule desired by Operation Iraqi Freedom's planners.²⁶ However, others point out that despite these perceived shortfalls, the war was executed successfully. Further, the significance of the current and projected shortfall may be mitigated by a historical review which indicates that DOD has always "required" more airlift than it was able to provide.

The Soviet invasion of Afghanistan in December 1979, prompted President Carter to declare that the United States would defend its interests in the Persian Gulf by force if necessary. Concern that U.S. military forces might be ill-prepared to carry out such a mission led Congress to ask DOD to conduct a study of the entire long-range strategic mobility situation, showing how much airlift and sealift would be needed to deploy forces to remote areas.

Known as the Congressionally Mandated Mobility Study (CMMS), a classified report was sent to Congress in April 1981. The CMMS considered all modes of strategic mobility and what it would take to satisfy the simultaneous demands of a major war in Central Europe and any one of three lesser contingencies, including a deployment to the Persian Gulf. The study established several long-range strategic airlift goals that were considered attainable within the limits of realistic budget assumptions. One of the conclusions was that 66 MTMD of airlift capacity would be needed by the year 2000. At the time of the study in 1981, the Air Force's long-range cargo capability was only 29 MTMD.

In 1991-1992, an updated Mobility Requirements Study (MRS) concluded that 57 MTMD would be required during the 1990s in a new set of scenarios based on changing international circumstances and reductions in the size and deployment of U.S. military forces. At the time, DOD's airlift capabilities were approximately 48 MTMD: a nine MTMD shortfall. The study also concluded that even with 120 C-17 aircraft and commercial cargo and transport planes in the Civil Reserve Air Fleet (CRAF), the total U.S. cargo airlift capability would remain at 48 MTMD because of the phaseout of aircraft reaching the end of their service life.

²⁶ Sharon Weinberger, "Handy: Airlift Shortage Forcing Military Tradeoffs," *Defense Daily*, Mar. 23, 2004, p.3.

The April 1995 Mobility Requirements Study Bottom-Up Review Update (MRSBURU) revised downward airlift requirements to 49.7 MTMD. Between 1997 and 2001, DOD's airlift capabilities fluctuated between 41 and 43 MTMD, consistently below the stated requirement. The MRSBURU also concluded that 120 to 140 C-17s, or some comparable aircraft, would be needed in the 1990s.

Budget and Cost Factors

A major issue in the C-17 program has been the fact that while it appears to offer great capabilities, the aircraft is more expensive than other potential alternatives. The acquisition of several proposed "non-developmental airlift aircraft" (NDAA) alternatives, as projected by their manufacturers and the Congressional Budget Office, were less expensive than an airlifter, such as the C-17, designed and manufactured to military specifications. (See "alternatives" section below). As of December 31, 2004, DOD estimated a 180-aircraft C-17 program to cost \$59.2 billion, for a program unit acquisition cost of \$328 million per aircraft. Unit costs have been reduced by multiyear procurement. Under the multiyear production contract of May 31, 1996, 80 aircraft were produced during the 1996-2003 period for some \$16.2 billion, at a program unit cost of \$202.5 million.²⁷ The current \$9.7 billion multiyear procurement contract equates to a price of \$161.6 million per aircraft. The contract calls for the delivery of 15 aircraft per year.

Another issue that has dogged the C-17 program has been a controversy over recent budget profiles. Congressional appropriators in FY2003 and FY2004 (see congressional action section below) have expressed concern that the Air Force has not requested funding consistent with "full funding" principles which guide prudent procurement practice and could be creating future liability for DOD and Congress. If the C-17 were being "incrementally funded" some fear that it would violate the *Antideficiency Act*, which defends against procuring items for which funds have not been allocated.²⁸

In March 2004, it was reported that a study by the House Appropriations Surveys and Investigation staff raised concerns that the Air Force had in fact overstepped its authority in the current C-17 MYP by committing DOD to producing the aircraft in advance of congressional appropriations.²⁹ The contract's liability clause (which pays a negotiated penalty to the manufacturer if the government decides to breach the terms of the contract) was also deemed suspect as inconsistent with general practice. Air Force officials disagree with these depictions of the C-17 MYP contract, and emphasize the cost savings realized by such contracts. In their FY2005 spending bill, Congressional appropriators strongly expressed their

dissatisfaction with the current C-17 funding profile.(see Congressional Action section, below)

Industry and Exports

Under current plans, the C-17 production line is scheduled to shut down in two years. If Boeing is not under contract for additional advanced procurement by January 2006, the final C-17 will be delivered in April 2008. DOD would need to begin funding advanced procurement of additional aircraft in 2006 to postpone this event. Some in Congress have encouraged DOD to procure more C-17s than are currently planned, arguing that airlift needs are increasing.³⁰ Procuring additional C-17s domestically or exporting them are seen as two potentially complementary methods of both keeping the production line open and reducing the per-aircraft production costs.

Appropriations conferees have directed the Air Force to study options for commercializing the heavy, outsized aircraft for incorporation into CRAF. (H.Rept. 108-553, p. 77.) Some industry studies suggest that a commercial market for up to 10 C-17s may exist for use in heavy industry, mining, or similar endeavors. The Air Force and Boeing have considered a number of different potential strategies to exploit or expand this potential market.³¹

The first potential strategy has been called the Commercial Application of Military Airlift Aircraft (CAMAA). Under CAMAA, DOD would loan money directly to companies or guarantee the financing of companies which would purchase C-17s from Boeing. Civilian owners of the BC-17X (as the commercial variant would be called) would make the aircraft available to DOD in time of need, much like CRAF. The Air Force proposed several options to sweeten the deal, such as helping companies find customers who need outsized cargo delivery and providing them monthly military business paid for at commercial rates. In addition to having access to these aircraft, the Air Force and civilian users would benefit because building BC-17Xs for civilian use would effectively exploit excess production capacity and help lower the per-unit cost of those aircraft bought by DOD.³²

A second potential strategy would be for the Air Force or the General Services Administration (GSA) to sell used C-17s to commercial companies. Commercial clients would, presumably, be interested in used aircraft because they would cost less than new aircraft. As part of the arrangement, the commercial owner would make the aircraft available to DOD in times of crisis, thus increasing the potential

³⁰ Gail Kaufman, "USAF C-17s May Come Earlier Than Requested," *Defense News*, Mar. 29, 2004.

³¹ Aircraft like the C-17, built to military specifications, tend to be too expensive for civil users. Trucks, ships, or large commercial aircraft are often used to move large industrial parts and products.

³² Amy Butler, "Commercial C-17 Buys Would Stabilize Cost, Enhance Reserve Air Fleet," *Inside the Air Force*, Dec. 22, 2000; Christian Lowe, "Air Force Issues Draft Solicitation for Civilian C-17s," *Defense Week*, July 9, 2001.

inventory of outsize/oversize airlifters available to DOD. The Air Force could use the profits of the sale to help finance the purchase of new C-17s.

A third potential strategy would be for the Air Force to trade in older C-17s to Boeing and receive credit to purchase new ones. Reportedly, the Air Force prefers this approach to selling the aircraft directly to commercial companies because it would relieve it of any potential responsibility for ensuring the aircraft are certified for civil application.³³

The feasibility of any of these strategies is unclear. In a “post-9/11” environment typified by a declining aviation market, few companies may wish to risk investing in such expensive cargo aircraft. Also, increased demands for long-range airlift may make increased C-17 buys more feasible for the Air Force and thus make a commercial variant less necessary. Some question why the Air Force would want to sell any of its C-17s if there is a growing requirement for them. On the other hand, one private company — Cargo Force — has publicly stated that it desires to purchase 25 to 80 C-17s, but some allege that DoD is blocking such a sale because it fears that this might reduce the likelihood that Congress will fund additional C-17s for the Air Force.³⁴

In October 2002 it was reported that DOD’s Business Initiatives Council had approved the CAMAA program as an “efficiency measure,” but DoD has reportedly cooled to this particular approach.³⁵ Some also question whether Congress’ appetite for unconventional financing and procurement strategies in the aftermath of the KC-767 tanker lease proposal.³⁶ Any creative attempts to establish an outsize/oversize commercial market based on the C-17 would likely have to be done without creating financial liability for DoD.³⁷

Close U.S. allies also have strategic airlift requirements that may be satisfied by the C-17. Having long recognized a deficit in their long range airlift capabilities, several NATO countries (Germany, France, Spain, Britain, Turkey, Belgium and Portugal) plan on purchasing the jointly developed A400M turboprop airlifter. This program has experienced numerous perturbations in schedule and budget. In December 2002, for example, Germany announced that it would reduce its planned acquisition of the A400M from 73 to 60 aircraft. Portugal, it is rumored, is considering cancelling its order entirely.³⁸ Some analysts suggest that NATO

countries should pool its resources and lease the C-17 or Russian AN-124 aircraft rather than trying to build their own airlifter.³⁹ Former NATO Secretary General Lord Robertson, for one, supports leasing C-17 and C-130J aircraft as a stopgap measure to improve NATO's airlift capabilities until the A400M enters service in 2008.⁴⁰

British defense officials view the C-17 as an asset that can be used in rapid-reaction operations. The United Kingdom's Strategic Defense Review of July 1998 indicated that the Ministry of Defense might lease or buy several C-17s to meet air mobility requirements of Britain's Rapid Reaction forces. In May 2000 it was reported that the U.K.'s Royal Air Force had committed to a \$750 million deal to lease four C-17s from Boeing for seven years. Deliveries began in the summer of 2001. Britain has "conditionally committed" to purchase 25 Airbus A400M transports following the C-17 lease. However, in October 2002 senior British defense officials said that they were considering holding on to its four C-17s once the lease had expired.⁴¹

Canada is another country that has given purchase of the C-17 some consideration. In May 2001 it was reported that the Canadian Department of National Defense had allocated almost \$1 billion (U.S.) to meet strategic lift requirements. In addition to the C-17, Canada is considering the Airbus A400M and the Antonov An-7X. Lt. Gen. David Kinsman, chief of Canada's Air Staff and commander of their Air Command said that Canadian forces have "a well established and recognized requirement for an outsized, C-17-like strategic airlifter."⁴²

Some Alternatives

Opponents of the C-17 have proposed alternatives ranging from extending the service life of cargo planes now in service to relying more on sea lift or developing large airships (blimps). Timeliness is the strongest argument for delivering military cargo by air, and some analysts believe that where time is not so critical it would be possible to use sea lift instead of buying additional airlift assets. The Department of Defense has steadfastly defended the C-17, arguing that it will be needed even more, as more U.S. troops return from overseas stations. The Air Force continues to assert that the C-17 holds high priority in relation to other Air Force programs, pointing out that the current U.S. airlift capability is only about 48 million ton miles per day compared to the 54.5 MTMD stipulated in the 2001 mobility requirements study.

Buy Fewer C-17s and More Commercial Aircraft. One proposed alternative is to buy fewer C-17s and to make up the shortfall with additional

commercial transport/cargo aircraft — referred to as “non-developmental airlift aircraft” (NDAAs). The leading candidate in the NDAA option is a military version of the Boeing 747 jumbo jet, designated the C-33. These Boeing C-33s would not be replacements for the C-17 but would fill the need for routine cargo flights between large airports. The C-17 can be operated on unimproved surfaces and can unload under austere conditions. Proponents of the NDAA argued that its acquisition cost would be less than that of the C-17, whose special performance features would not be needed in many airlift operations.

Air Force officials conceded that in some situations a mix of C-17s and NDAAs might be the most cost-effective way to carry military cargo. However, DOD’s decision in November 1995 reflected a choice of an all-C-17 force of 120 aircraft (including the 40 then under contract) in lieu of a C-17/NDAA mix. A 1997 report by the Congressional Budget Office (CBO) stated:

If there was adequate room at airfields in regions of potential conflict, buying 32 more C-17s plus 30 C-33s would provide the same delivery capability as 80 additional C-17s. That option would also be nearly \$8 billion cheaper.... If, however, U.S. forces were limited to a few airfields that had a small amount of ramp space, that option might not deliver cargo as quickly as would 80 more C-17s. And such a combination would not provide as much flexibility to handle specific military missions such as strategic brigade airdrops.... The appropriate mixture of planes depends on how much DOD and the Congress are willing to pay for the flexibility provided by 80 additional C-17s.

This report considered the costs and capabilities of five alternatives to Administration plans for modernizing strategic airlift and sea lift, including buying fewer C-17s with estimated savings of \$8.4 to \$18.9 billion in 1998-2020.⁴³

Modernize the C-5 Galaxy Fleet. The Air Force owns 110 C-5s: 64 C-5As, 44C-5Bs, and two C-5Cs modified for the space program. On average, the A models are eight years older than the B models. The C-5, made by Lockheed Martin, is typified by its payload and range. One of the largest aircraft in the world, the C-5 can carry 160,000 lbs of cargo up to 3,730 nautical miles, and has a maximum payload of 291,000 lbs. The C-5 can carry large and irregularly shaped cargo, such as the Army’s 74-ton mobile scissors bridge, that no other U.S. aircraft can hold. Both the nose and aft ends of the C-5 open, facilitating rapid loading and off-loading. The C-5 has been plagued by reliability problems; its mission capable rate for 2000, for example, was 58 percent.

The debate regarding the C-5 fleet is how many aircraft should be modernized and kept operational, and how many should be retired. Rising maintenance costs have led some to argue that more C-5s should be retired sooner, and the savings be applied to increased purchases of the new and modern C-17. Proponents of the C-17 also argue that reducing the C-5 fleet in favor of C-17s make sense given the growing

⁴³ U.S. Congressional Budget Office, *Moving U.S. Forces: Options For Strategic Mobility*, Rachel Schmidt, Feb.1997; U.S. General Accounting Office, *Military Airlift — Options Exist for Meeting Requirements While Acquiring Fewer C-17s*, GAO/NSIAD-97-38, Feb. 1997.

need to engage terrorists and insurgents in theaters with limited aviation infrastructure. The Cold War paradigm of using strategic cargo aircraft to move large amounts of materiel to forward U.S. bases, then moving it a second time to the theater of operations on smaller airlift aircraft is not efficient, they argue. The C-17, they say, can do the job of both the C-5 (strategic airlift) and the C-130 Hercules (intra-theater airlift) and move war materiel directly from the United States into combat, if need be. As a more modern aircraft, the C-17 also offers more potential for upgrades and modifications than the C-5, it is argued. The C-17, for example, might be an option to consider when replacing the Air Force's aging fleet of AC-130 gunships. Investing more in the C-17 today, proponents argue, could benefit the Air Force in a number of ways that are currently not even obvious. Modernizing C-5Bs might make sense, some say, to improve that aircraft's mission capable rate, but sinking billions of dollars into the C-5A fleet is not a prudent investment.

Opponents of proposals to retire C-5s in favor of increased C-17 purchases say that the C-5 offers unique capabilities that the C-17 can't match. In a period of increasing mobility requirements, they argue, it makes little sense to prematurely retire aircraft in today's inventory. Proponents of the C-5 point out that over 70 percent of the Galaxy's structural life remain, which suggests that today's investments could be recouped for decades. The per-aircraft cost of AMP and RERP is expected to be approximately one-third that of a new C-17, and the C-5 will carry twice the payload. The upgraded aircraft (called the C-5M), is also expected to have greatly improved mission capable rates.⁴⁴ C-5 proponents also note that over the past three years, DOD has leased Russian AN-124 aircraft to carry outsize and oversize cargo because C-5 aircraft were unavailable. In 2003, it was estimated that the 79 AN-124 missions conducted in that year cost DOD \$28.9 million.⁴⁵ While the C-5 may not be as modern as the C-17, or able to operate from as many runways, the fact that DOD has to outsource missions to Russia indicates that the C-5 still offers important capabilities that the C-17 can't.

Currently, it appears that the Air Force plan is to upgrade and maintain both the C-5A and C-5B models.⁴⁶ On July 14, 2004, the Air Force's Fleet Viability Board (AFVB) released its assessment of the C-5A fleet. The AFVB found that the C-5A fleet — with appropriate investments — has at least 25 years of life remaining.⁴⁷ In Sec. 133 of their report on H.R. 1588 (H.Rept. (108-106) p. 97, House authorizers expressed concern over potentially premature retirement of the C-5A fleet, and

recommend a provision that would limit the Secretary of the Air Force from proceeding with a decision to retire C-5A aircraft from the active inventory if the active inventory of such aircraft would fall below 112, until a RERP (re-engine and reliability program)- configured C-5A aircraft completes a dedicated initial operational test and evaluation, and the Department of Defense's Director of the Operational Test and Evaluation has provided his assessment of the RERP-configured C-5A's performance to both the Secretary of Defense and the congressional defense committees.

Invest in Lighter-than-Air Concepts. The Army, the Navy and the Joint Staff have, or are studying, the pros and cons of augmenting fixed-wing airlift aircraft with "lighter-than-air" aircraft. Also known as airships, blimps, dirigibles, or zeppelins, these potentially large, helium-filled balloons offer many potential advantages over fixed wing aircraft. One potential advantage is cargo capacity. Some airships being considered can carry up to 1,000 tons (2.2 million lbs) of cargo. Thus, the cargo capacity of just one airship is roughly equivalent to the payload of 13 C-17s. Because it can hover, and land vertically on both land and water, airships can potentially deliver their cargos from the United States directly to the theater of operations, eliminating inter-theater transport, and reducing U.S. dependence on forward basing.

Opponents to lighter-than-air concepts argue that airships fly slower than fixed-wing aircraft, and are probably more vulnerable to enemy missiles. Proponents counter that while the airship top speed of 100 knots is slower than an airlifters speed (typically 450 knots) the very large payload makes up for the slower speed, and that some cargo can be delivered at slower rates and still meet operational needs. Also, airships may be more survivable than they appear, proponents argue, because despite their large sizes, airships have smaller radar and infrared signatures than airlift aircraft.⁴⁸

⁴⁸ For more information see CRS Report RS21886, *Potential Military Use of Airships and Aerostats*.

Congressional Action

The Bush Administration's budget for **FY2006** requested \$4.1 billion in overall C-17 funding, and is broken down in the table below. Congressional action is also described, with changes to the request highlighted in **bold** text.

C-17 FY2006 Funding (\$ Millions)			
	Procurement		R&D
	\$	#	\$
Request	MYP 2790.9 APCY 445.4 Mods 260.8	15	165.7
Authorization, House	Matched all funding requests		
Authorization, Senate	Matched all funding requests		
Appropriations, House	2790.9 445.4 176.8	15	165.7

Both house (H.R. 1815 Sec.131) and Senate (S.1042 Sec. 133) authorizers expressed support for DOD to enter into a new multiyear procurement contract for 42 additional C-17s.

The Bush Administration's budget for **FY2005** requested \$4.1 billion in overall C-17 funding, and is broken down in the table below. Congressional action is also described, with changes to the request highlighted in **bold** text.

C-17 FY2005 Funding (\$ Millions)

Appropriations, Conference	2,671.0 381.8 786.9 89.1	15	201.7

Appropriations conferees supported the house position to procure 15 C-17s in FY2005, provide advance procurement for 15 aircraft in FY2006, and fully fund these aircraft. House appropriators (108-553, p. 192) were "extremely displeased by the Air Force's continued use of a flawed and irresponsible financial strategy for the C-17 multiyear procurement contract." Committee members wrote that the Air Forces' approach to funding the C-17 was "an incremental financing scheme that abused the political support for the program and flaunted acquisition regulations and standard practices." (108-553, p. 192) The appropriators reduction of \$159.6 million from the C-17 ICS line funded the increase in MYP.

Appendix I: System Description⁴⁹

Power Plant:	Four Pratt & Whitney F117-PW-100 turbofan engines
Wingspan:	169 feet 10 inches (to winglet tips) (51.76 meters)
Length:	174 feet (53 meters)
Height:	55 feet 1 inch (16.79 meters)
Cargo Compartment:	length, 88 feet (26.82 meters); width, 18 feet (5.48 meters); height, 12 feet 4 inches (3.76 meters)
Speed:	450 knots at 28,000 feet (8,534 meters) (Mach .74)
Service Ceiling:	45,000 feet at cruising speed (13,716 meters)
Range:	Global with in-flight refueling ⁵⁰
Crew:	Three (two pilots and one load master)
Maximum T/O Weight:	585,000 pounds (265,352 kilograms)
Load:	102 troops/paratroops; 48 litter and 54 ambulatory patients and attendants; 170,900 pounds (77,519 kilograms) of cargo (18 pallet positions)

C-17 Globemaster III Taking off From Unfinished Runway

USAF photo by 1st Lt. Laurel Scherer

⁴⁹ Information derived from C-17 Globemaster III Fact Sheet, [<http://www.af.mil/factsheets/factsheet.asp?fsID=86>] and Air Force Magazine, 2000 USAF Almanac, May 2000.

⁵⁰ The first 70 C-17s have an unrefueled range of 4,370 miles with a 90,000 lb load. An extra fuel tank will be installed in the 71st and subsequent aircraft which will extend the unrefueled range to 5,060 miles with a 90,000 lb load, Seena Simon, "Extra Fuel Tank Allows C-17s to Fly Farther," *Air Force Times*, Apr. 2, 2001.
