

LABOR STANDARDS APPLICATION PROGRAM
BLAST AND PAINT SHOPS
FINAL REPORT

Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

December 28, 1984

This project is managed and cost-shared by Peterson Builders, Inc. for the National Shipbuilding Research Program. The program is a cooperative effort of the Maritime Administration's Office of Advanced Ship Development, the U.S. Navy, the U.S. shipbuilding industry, and selected academic institutions.

Peterson Builders, Inc.
Labor Standards Application Program
Phase IV FY-83
Blast and Paint Shops
Task ES-8-19

FINAL REPORT

1. Program Objective

This Report describes the participation of Peterson Builders, Inc. in the Maritime Administration (MarAd) National Shipbuilding Research Program for FY-83 to implement labor standards during ship construction towards controlling production costs in the two closely related areas of blasting and painting. The overall objective of this Research Program is to reduce the cost of building ships. The objective of this specific project in the blast/paint areas was to improve planning, scheduling, production control, and worker productivity through the application of labor standards, and thereby reduce the cost of blasting/painting operations.

2. Project Conceptual Plan

The PBI proposal for this project lists six major Tasks intended for accomplishment during this .program. These Tasks outline the

general commitments considered necessary to provide a workable and successful program for implementing labor standards. The listing that follows briefly describes these Tasks, which cover a broad range of effort.

Task A - Develop procedures, charts, and other forms for presenting labor standards information at a level of detail suitable for use by planners and schedulers in applying labor standards to actual production work.

Task B - Determine non-process factors in each area of concern.

Task C - in planners and schedulers in techniques for applying labor standards;

Task D - Instruct supervisors' on the purpose and application of labor standards.

Task E - Develop a system to monitor the currentness of labor standards.

Task F - Write a final report summarizing program success./failure, productivity and cost savings attainable, and related conclusions.

The format used for developing-labor standards data prior to the

FY-83 program was the H. B. Maynard Work Management Manual (WMM) which served as a guide to the process of obtaining and documenting standard data. Each of the ten sections of the WMM identified specific data covering the conditions that occurred on the job. In conjunction with the WMM, the Maynard Operational Sequence Technique (MOST) was the system used to process the standard data. The several work methods involved in each area of concern were identified, and labor time was assessed to each of them.

The FY-83 MarAd program commitment was to implement labor standards in the areas for which labor standard" data had already been developed during the FY-82 program. Before the actual start of the FY-83 program, the need for a more detailed plan that would direct efforts to implement labor standards and accomplish the goals of the FY-83 program was clearly recognized. This plan was devised by P231, and was termed the MarAd Project General Approach. The plan would: (1) list the phases that had to be accomplished; (2) state the objectives to be met during each phase; (3) provide a procedural step-by-step plan of action and sequence for carrying out each phase; and (4) make it possible to establish schedules leading to completion of the phases and the project on time.

The development of each phase would consist of: (a) a written' statement of the objective of that phase; (b) a detailed plan of action; (c) the actual implementation of the plan of action to

accomplish the given objective; and (d) a follow-up report of results, problems, and actions taken or needed to improve conditions and achieve the goals of the overall project.

3. Methodology

The specific approach used during this project is described below, and consists of seven Phases, the last two of which were not reached (See paragraph 4.1). These Phases are first listed, and are then described individually in detail. (Note: PBI, General Operating Procedures in the blast and paint shops are contained in Appendix A.)

- Phase I - Establish Baseline Data
- Phase II - Validate Labor Standards
- Phase III - Formalize Queuing Procedures
- Phase IV - Apply Labor Standards
- Phase V - Examine Delay Time (Project terminated here.)
- Phase VI - Refine Application Procedures
- Phase VII - Evaluate Cost Effectiveness

3.1 Phase I - Establish Baseline Data

The purpose of obtaining baseline data was to capture working conditions on the job prior to the application of labor standards. The absence of adequate labor reporting records and performance data with which to compare productivity changes made

the collection of baseline data absolutely essential. The system of labor reporting did not identify the individual job. Rather, labor time was charged to a general account number encompassing many jobs.

Baseline data was gathered using forms designed by PBI called Activity Sheets (Appendices B and C). On these sheets were recorded the actual methods being employed and actual worker time on the job. Information on non-process conditions was also gathered on these same sheets.

A Product Mix Sheet (Appendix D) was also used to see what impact a variable product mix might have on establishing a format to apply labor standards. Part configuration was found to be more important than product mix.

A spot sampling check was also used as a technique to get on-the-spot data, without involving any judgement factors. This technique was used to sample value-added time, as follows:

- 1 Process time with value-added - time that adds value to the product, enhances it; machining, welding, painting, etc.

- 1 Process time with no value-added - time that does not add value to the product, but is necessary to get the job done; load and unload piece.

Non-process time with no value-added - in effect, wasted time; idle time, improper method.

Figure 1.shows value-added comparisons based on worker activities in the blast/paint areas.

Abbreviations for Figure 1

PW/VA	-	Process with value added
PW/OVA	-	Process without value added
PFD	-	Personal, fatigue, and delay
BS	-	Blasting sections,
BLP	-	Blasting loose parts
PS	-	Painting sections
PLP	-	Painting loose parts

MAY 14, 1984

Figure 1

3.2 Phase II - Validate Labor Standards

Validation of existing labor standards was considered necessary to determine whether methods observed earlier in the FY-82 labor standards program had changed, and would require updating. Current methods were observed to substantiate whether they were still being used, as well as to measure the related labor times. Changes were reviewed and questioned, as were any new methods encountered in the blast/paint areas. Where a change did occur, evaluation was carried out to determine whether it: (1) involved improved paint application; (2) improved blasting capacity and skill; (3) reduced the time to do the work; (4) added truly necessary steps; and (5) changed shop conditions or facilities.

The validation process was an effective way to identify and remove from consideration those methods that were no longer used, and to correct those methods that had changed substantially. One of the major changes encountered was that the paint shop had shifted to almost 100% airless spraying with the purchase of a plural component paint mixing and pumping system.

3.3 Phase III - Formalize Queuing Procedures

Queuing procedures, for the most part, were non-existent at the start of the FY-83 program. There was no scheduling of blast/'paint actions, no parts transfer paperwork, no adequate information on the part itself, . and no documented information on

what had to be done to the part. It was intended to establish queuing procedures so that it would be possible to apply labor standards to the work. The first need was to get control of what was happening. Several new forms were tried, as follows:

1 Material Move Request (Appendices E and E1) - this form would provide all the information needed on the job and would get the part moved to the blast/paint area. The information on the form would then be used by the blast/paint scheduler in filling out a Job Card.

1 Job Card (Appendices F and F.1) - this form was filled out from information on the Material Move Request. The card was given to the worker at the start of the job, who filled in his name, clock number, time in and out, and the number of pieces.

1 Material Move Request Form and Job Record (Appendix G) - this combination card was later tried at the request of the shop scheduler, in an attempt to adapt to the present system more effectively than with the two separate forms.

Ž UARCO (Appendix H) - this form is a material requisition form commonly used at PBI. Evaluation disclosed that it did not request all the information needed to apply a labor standard to the job.

Trial usage of the Material Move Request, the Job Card, and the

Material Move Request Form and Job Record revealed that they required a large amount of effort, particularly on the part of the scheduler. The Material Move Request was filled out by the sending department and was made up of three copies; one for the sender, one for the part load, and one for the department receiving the parts. The Job Card also resulted in too much paperwork. Ordinarily a Job Card was needed for each part. A summary Job Card was considered for very short cycle jobs such as jobs with a cycle time of 0.3 hours and jobs with less than five pieces. Use of the UARCO form took less time than the others, but it did not contain all the information needed. Clearly, the time consumed by the overall forms effort indicated the need for a computerized routing system. Such a system was not in place, nor could it be established soon enough to benefit " this project.

In view of the conditions surrounding the movement and handling of parts, and the absence of an acceptable format for obtaining information needed for applying labor standards, it was not possible to establish and implement effective queuing procedures.

3.4 Phase IV - Apply Labor Standards

The objectives of this Phase were to apply labor standards, monitor work performance, record problems, work up solutions to the problems, and make the necessary changes. This Phase overlapped somewhat into Phase III, as scheduling standards were

already being applied coincident with attempts to implement queuing procedures. Standard times were taken from pick-off charts (Appendices I through P). Information not available from the UARCO form was gained from other sources, but this action proved to be very time consuming.

The problems discovered in implementing the labor standards were: (1) insufficient lead time from when the parts were received to when they had to be completed; (2) inadequate information on the UARCO form to apply the labor standard to the job; and (3) inadequate records as to where the stock was located in the yard. These problems were treated, and some improvements were made on the first and third items. However, the UARCO form with its shortcomings, and the paperwork handled manually, were not conducive to the application of labor standards. For ship sections and large parts which were tracked closely, however, few problems were encountered.

Being unable to effectively implement labor" standards for loose parts, and seeing no immediate improvements in queuing procedures, the only recourse was to terminate the labor standards project in the blast/paint areas. This was done on July 17, 1984.

3.5 Phase V - Examine Delay Time

This Phase identified the delay times observed in Phase I and Phase IV. The objective was to isolate delay times, investigate the reasons for the delays, and find solutions that would eliminate or at least reduce the lost time. Each delay was given a thorough review toward reducing the impact on job performance.

The non-process factor is made up of the remaining unavoidable delays and is a separate add-on to the standard (Appendix Q). The non-process factor accounts for real and acceptable differences between level times and actual times to accomplish the work. In the blasting area the non-process factor amounted to 10.8%. In the loose parts painting area the non-process factor was 8.4%. Some of the delays in the blasting area were a result of scheduling difficulties, and recurring problems with the large doors to the booth. The scheduling difficulties have lessened somewhat, but the door problem persists and will probably require door replacement.

In the loose parts painting area, the delays which had to do with the painting of loose parts involved substantial time for parts to air dry, along with excessive handling time. In addition, the laying out of parts on 4' X 8' plywood sheets created very congested working conditions' in the shop. A drying oven was installed to speed up the drying cycle time. While previously six to eight hours was required to air dry a part, oven drying

time is only ten minutes. Oven drying proved to be an effective approach to the elimination of most of the drying delay time, and stepped up productivity at least thirty-eight times faster.

Another productivity improvement resulting from delay time examination was the purchase of a plural component proportioning system for mixing paint. This system reduced mixing and cleaning time, supported airless spraying equipment, and reduced paint waste in mixing. These improvements appear as benefits from the program (paragraph 4).

3.6 Phase VI - Refine Application Procedures

The object of this Phase was to simplify the method of applying labor standards based on experience gained during the trial period, and 'co instruct planners and schedulers in techniques for applying labor standards. This Phase is a take-off and refinement of Phase IV to further improve application procedures. This Phase was not reached because the project was terminated.

3.7 Phase VII - Evaluate Cost Effectiveness

A brief evaluation of costs to apply labor standards vs. savings from the application of labor standards was made, even though the project had to be terminated. Costs for this type of program must be viewed in the long run, because initial costs are bound to be high. In this specific case, continuing on despite major

implementation difficulties clearly was not cost effective. Depending on the results of the companion effort at PBI to apply labor standards in the electrical area, the future may hold another attempt to treat the blast/paint areas. By that time, and based on experience gained both during this project and the companion electrical project, implementation may be more manageable.

4. Overview, Conclusions, and Benefits

4.1 Overview

From the start of this project, the implementation of labor standards in the blast/paint areas was viewed with some reservation. The concern at hand was not that the implementation of labor standards was technically unfeasible, but rather that establishing the changes needed to allow for a suitable implementation program would be difficult. The lack of any formal system at PBI to move parts to the blast/paint areas was recognized as an initial condition, as was the lack of readily available information needed to identify the parts in order to establish the labor standards. These concerns were expressed in several of the Monthly Progress Reports on this project. There was also some question as to whether the application of labor standards would generate enough savings to cover the application costs. The following conditions were identified which could adversely affect the implementation of

labor standards. in the blast/paint areas:

- . Lack of formal scheduling of work to these facilities.
- . Absence of an adequate tracking system for loose parts.
- . Scarcity of information on actual job performance.
- . Lack of a formal yard transportation system with dependable movement of parts.

These conditions impact the application of labor standards, and the resulting problems were amplified because 80% of the total blast/paint work goes through the loose parts painting area. Forms and procedures were developed and implemented in an attempt to combat these conditions, but proved to be too time consuming and had to be abandoned.

Faced with the inability to remedy the existing conditions, and seeing no immediate opportunity for substantial improvements like the introduction of a computerized routing system, the balance of the project to implement labor standards in the blast/paint areas was terminated on July 17, 1984.

4.2 Conclusions

Although the full project was not carried to completion, several conclusions were reached relative to the implementation of labor standards:

- 1 A routing system (preferably computerized) is essential to control the movements of, and provide information on, the large volume of individual parts (about 80% of the total items) encountered in the blast/paint areas. Such a system would make queuing procedures workable, and thereby support the efficient application of labor standards with attendant savings in productive effort.

- 1 The sampling techniques employed, in combination with the insight gained into productive work by means of the labor standards, proved to be both efficient and effective in highlighting major problem areas (e.g. excessive air drying time; excessive paint mixing and cleaning time) leading directly to corrective actions (e.g. drying oven; plural component proportioning system for mixing paint).

- 1 Labor standard data needs periodic updating to accommodate changes in production procedures and equipment, some of which are subtle and may be unnoticed unless and until a formal investigation is made.

The classical advantages of applying labor standards to production work are real, valuable, and dynamic. An effective labor standards program provides improved knowledge about the productive processes, which enables improvements in the credibility of planning scheduling, estimating, manpower loading, and overall productivity targets. Workers and supervisors have a reliable guide to reasonable performance, and those supporting and controlling production have a reliable performance reference on which to base their involvements.

4.3 Benefits

Although the project was terminated before extensive labor standards implementation in the blast/paint areas was realized, several major benefits resulted directly from this project:

c The paint drying oven, installed in July 1984, provides greatly improved productivity, reduced waiting time, and improved accessibility to the paint booth area for ship sections and loose parts (by elimination of air drying tables). The cost to paint loose parts has dropped substantially. On a three shift operation at the current cost reduction rate, estimated yearly savings would be \$176,505.00. In addition, what was once a critical backlog of unpainted parts is now a one-to-two day turnaround for parts dried in the oven.

- Installation of a plural component proportioning system to handle two part epoxy paint mixing has produced savings estimated at \$24,000.00 per year. This is largely due to less paint waste, reduced mixing time, and use of an airless spraying system.

- 1 If labor standards had been fully implemented in the blast/paint areas, the overall savings are estimated to exceed 35% or \$109,200.00 per year.

- 1 The assignment of a scheduler to the blast/paint area, and the resultant prescheduling of parts~ has provided better control over parts coming to the blast/paint booths.

- 1 Labor standards data from this project will be directly applicable to a project now in progress "The Economics of Shipyard Painting", for the 023-1 Panel of the SNAME Ship Production Committee under the MarAd National Shipbuilding Research Program.

GLOSSARY

Baseline Data - The measure of the efficiency rate and performance level in the department (within or outside the shop) at the current time before there are any changes or implementation of a labor standards program to improve the productivity of this department.

Standard Data - A set of synthesized time values established using the MOST technique.

Labor Standards - A combination of standard data setup in an organized pattern to cover work content.

Process with Value Added - Is any physical change that takes place to the product, i.e., painting, blasting a profile on material, bolting two pieces together, etc.

Process without Value Added - Is any supporting activity to the process that doesn't physically change a product, i.e., setup and tear down equipment, operator loading and unloading parts, etc.

Avoidable Delay - A delay which is under the control and responsibility of the worker (i.e., wasting time, inefficient or improper work method).

Unavoidable Delay - A delay which is outside the control or responsibility of the worker (i.e., receive instructions, cleanup).

Non-Process Time - The time spent by workers while engaged in activities outside the basic process (personal time, waiting for material, equipment breakdown, delays, etc.).

Non-Process Factor - A factor developed to take into account the real, natural and acceptable differences between level times and actual times for accomplishing work. The magnitude of the non-process factor is based on a work sampling conducted at the work place.

Appendix A

Peterson Builders, Inc. General Operating Procedures Blast and Paint Shops

This Appendix describes the general operating procedures used in the Blast and Paint Shops.

A.1 Transfer

A.1.1. All loose parts to be blasted and/or painted shall be accompanied by a UARCO form filled out with the following information (see Appendix H of this Report for a sample UARCO form).

- 1 - Contract No. (use WORK ORDER NO. space)
- 2 - Date of Transfer (DATE)
- 3 - Drawing No. (DRWG. NO.)
- 4 - Date Required (DATE REQ'D.)
- 5 - Hull No. (use space at top of form)
- 6 - Department originating the transfer (DEPT.)
- 7 - Part No. (PIECE NO.)
- 8 - Number of pieces for each part (QUAN.)
- 9 - Directions to blast/paint the parts (use ITEMS space)
- 10 - Destination after blast/paint (use ITEMS space)
- 11 - Preparer's Signature (BY)

A.1.2. The UARCO form is filled out by the Department requesting the parts to be blasted and/or painted. This Department should call the Paint Shop (Ext 159) and ask for the Leadman in charge of scheduling (Bruce Jorgensen). The Leadman/Scheduler will indicate when the material may be delivered to the Paint Shop (or associated storage area). When the material arrives at the Paint Shop it must be accompanied by a properly filled out UARCO form. The Leadman/Scheduler uses the information on the UARCO form for scheduling the material within the shop.

A.2 Material Handling

A.2.1 Material is stored on racks in the designated paint storage area, or (if there is room) in the blast or paint booths. Material is brought into the blast/paint area by one of five ways: by hand, cart, forklift, Go-Devils, or on a jig (as with large sections).

A.2.1.1 Material brought in by hand is loaded directly onto tables.

A.2.1.2 Material brought in by cart is usually left on the cart inside the Paint Shop.

A.2.1.3 Material brought in by forklift is left on its pallet or in its tote pan, or may be a single part moved into the Shop by the forklift.

A.2.1.4 Material brought in by Go-Devil is loaded on racks (side shells and plates) or on large stands (tanks and other large bulky-shaped items).

A.2.1.5 Large sections are set on a jig which is pushed/pulled by tractors and/or Go-Devils. The Building Maintenance Crew is called in to open the doors of the Blast or Paint Shop. The section on the jig is moved into the building where it is blocked and left for blasting/painting.

A.3 Blasting

A.3.1 Small parts (under 30#) are loaded on a steel grate table. Larger parts are left on their pallets or on the floor. The material is blasted to a near white to obtain the proper mil profile, or else sweep blasted (if previously blasted and having a coat of shop primer). (Note: Sweep blasting is for cleaning the material of light rust and dirt. It is not intended for applying a profile to the material.)

A.4 Clean Up

A.4.1 Individual parts

The material is blown off using an air hose to remove the grit left after blasting. The vacuum recovery unit is used to vacuum up the grit that collects inside tight spots and to replenish the supply of grit to the blasters. The material is then transported to the Paint Shop by the same means it was delivered to the blast booth. Note: If a scheduling problem or bad weather occurs, the material can be painted in the blast booth.

A.4.2 General Area

When grit in the hoppers runs low, or before and after removal of a large section on a jig, grit is picked up off the floor and dumped at the conveyor opening by a small front-end loader. The remaining grit is swept into a pile by a power brush, and then moved to the conveyor opening by a small front-end loader. The conveyors are turned on, and the operators check for larger contaminants that may clog the conveyor. When the hoppers have been filled to the top of the window plate, the conveyors are turned off. Note: Hoppers must not be filled past the top of the window plate because the grit will overflow into the waste barrel.

A.5 Painting

A.5.1 In the paint booth, loose parts and large sections are painted by one of five ways: dipping, brushing, rolling, conventional spraying, and airless spraying. Areas to be masked, such as joint edges or other specified surfaces, are covered with masking tape before paint is applied. The masking tape is removed as soon as the paint is dry to the touch and does not easily scratch off by hand.

A.5.1.1 Dip Painting

Only very small parts in large quantity are dipped. They are placed in a dipping basket, dipped into the paint, and then spread out over a screen mesh.

A.5.1.2 Brush Painting

Brush painting is only used for touch up in the Paint Shop. Paint is applied by brush to areas that have been scratched, missed, have runs, etc., and to apply shop primer over welds and edges that were masked off for fit up.

A.5.1.3 Roller Painting

Painting with a roller is used for the application of fire retardant paint to wood, or vapor barrier paint to insulated duct work.

A.5.1.4 Conventional Spraying

Conventional spray painting is used when a small quantity of paint is needed, usually two quarts or less. Loose parts are painted on one side. When dry, they are turned over and a coat of paint is applied to the other side. This process is repeated until the required number of coats have been applied.

A.5.1.5 Airless Spraying

Airless spraying is the process used most often for large quantities of loose parts, large sections, side shells, plates, tanks, etc. which are to be painted with the same type of paint. The paint is applied and checked periodically for the recommended mil thickness. The number of coats applied depends on the painting schedule and contract specifications.

A.6 Drying

A.6.1 Air Drying

All large sections air dry because of their size. Loose parts are left to air dry on the pallets or four-wheel carts where they were painted, or are laid out on tables made up

of bucks, 2" X 4"sr and 4' X 8' pieces of plywood.

A.6.2 Oven Drying

Loose parts are loaded on aluminum carts which move on a track in and out of the oven. The parts are then painted and the operator starts the painting/drying cycle. The doors open on the oven, and one cart goes into the oven as one cart comes out of the oven. The oven doors close and the timer resets for ten minutes. This process is repeated until the specified number of coats have been applied to the parts.

A.7 Painting Procedure - Paint Booth

A.7.1 Set Up Procedure for the Painter

A.7.1.1 Equipment for personal protection

The operator wears gloves, coveralls, earplugs, mask, helmet liner, hardhat, and safety glasses.

A.7.1.2 Set Up Operator

Put on coveralls, safety glasses, and hardhat. When working in a place with excessive noise wear earplugs. When painting, wear a mask with helmet liner and gloves (optional).

A.7.2 Conventional Painting Equipment

A.7.2.1 Toola

- 1 - Crescent wrench
- 2 - Screwdriver
- 3 - Putty knife
- 4 - Wst mil gauge
- 5 - Rags

A.7.2.2 Equipment

- 1 - Pressure pot
- 2 - Spray gun
- 3 - Air hose

A.7.2.3 Set Up Conventional Equipment

- 1 - Set up pressure pot.
- 2 - Use crescent wrench to loosen four wing nuts.
- 3 - Remove cover and set aside.
- 4 - Place screen in pressure pot.
- 5 - Pour mixed paint through screen into pressure pot and set aside paint can.
- 6 - Remove screen and rinse in thinner tank.
- 7 - Place cover on pressure pot.

- 8 - Hand tighten four wing nuts on cover evenly.
- 9 - Tighten four wing nuts evenly with crescent wrench.
- 10 - Attach air hose to pressure pot.
- 11 - Turn lever to pressurize the pot and feel for air leaks. If there are no air leaks, the pressure pot is set up correctly. If there are air leaks, disconnect air supply and repeat steps 9, 10, and 11.

A.7.2.4 Set Up Spray Equipment

- 1 - Uncoil air hose and paint hose and remove any twists or kinks.
- 2 - Fasten airline and paint hose to pressure pot using wrench.

A.7.2.5 Teardown and Clean Pressure Pot

- 1 - Turn off air supply at pressure pot.
- 2 - Disconnect air hose from pressure pot.
- 3 - Slowly open valve at pressure pot to release air pressure in pot.
- 4 - Loosen four wing nuts with crescent wrench or suitable tool.
- 5 - Remove cover from pressure pot.
- 6 - Dump paint out of pot into waste bucket.
- 7 - Use rag with thinner and wipe out pot and inside of cover.
- 8 - Pour about 1/3 gallon of thinner into pot.
- 9 - Place cover on pot and tighten four wing nuts.
- 10 - Connect air hose to pressure pot.
- 11 - Turn on valve to pressurize pot.
- 12 - Spray paint into waste bucket until only thinner comes out. Then spray into waste thinner bucket, occasionally covering spray tip with rag until the thinner is used up.
- 13 - Turn off air at pressure pot.
- 14 - Disconnect air hose from pressure pot.
- 15 - Repeat steps 3, 4, and 5.
- 16 - Wipe out pot and cover with rag.
- 17 - Replace cover and tighten four wing nuts by hand.
- 18 - Loosen air line and paint hose connection to spray gun.
- 19 - Place spray gun in thinner.
- 20 - Coil air hose and paint hose around pressure pot and return to storage.

A.7.2.6 Set Up Spray Gun

- 1 - Uncoil air hose and paint hose and straighten, removing any twists or kinks.
- 2 - Fasten air hose and paint hose to pressure pot using wrench.

- 3- Fasten air hose and paint hose fittings to spray gun.
- 4- Turn on air lever and paint lever at pressure pot.
- 5- Test spray pattern on spray gun. "Adjust spray pattern using two knobs on spray gun to 12" fan.

A.7.3 Airless Spray Painting

A.7.3.1 Set Up Airless Sprayer

- 1 - Select correct spray tip for the paint application.
- 2 - Attach spray tip to airless spray gun with a crescent wrench.
- 3 - Place siphon tube in paint bucket.
- 4 - Connect air supply to the airless sprayer.
- 5 - Place spray gun in waste bucket and spray into bucket until all the thinner is forced out of the paint line, and paint is visibly coming out.
- 6 - Check for leaks and test spray pattern by depressing trigger, and visually inspect pattern.

A.7.3.2 Clean Up Airless Sprayer

- 1 - Turn off air at airless sprayer.
- 2 - Pull lever at airless sprayer to release air pressure.
- 3 - Remove spray tip using a crescent wrench and set aside.
- 4 - Using a rag and thinner pail, remove siphon tube from paint bucket, wipe siphon tube with rag, and place siphon tube in thinner pail.
- 5 - Turn on air at airless sprayer.
- 6 - Spray into waste pail. This will empty the paint hose of paint, and fill the hose with thinner.
- 7 - Disassemble spray tip for cleaning using a screwdriver.
- 8 - Spray the spray tip with thinner from the spray gun until the spray tip is clean.
- 9 - Assemble spray tip and set aside.
- 10 - Disconnect air hose from airless sprayer.
- 11 - Release pressure from spray gun by pulling the trigger.
- 12 - Remove the filter cap.
- 13 - Take filter apart and replace cap.
- 14 - Connect air hose to airless sprayer.
- 15 - Using spray gun, clean filter and inner filter.
- 16 - Disconnect air hose from airless sprayer.
- 17 - Remove filter cap and place inner filter and filter in filter cap.

- 18 - Connect filter and inner filter to airless sprayer.
- 19 - Remove siphon tube from thinner bucket and place in siphon holder.

A.7.3.3 Mixing Paint - Two Part

- 1 - Mix paint - two part
- 2 - Open paint can cover using a screwdriver.
- 3 - Place air mixer in thinner tank.
- 4 - Operate air mixer in thinner tank to clean mixer.
- 5 - Place mixer in paint and operate mixer for about 30 seconds to mix paint.
- 6 - Move mixer from paint to thinner tank and operate mixer in thinner to clean.
- 7 - Remove inner pail from two-part paint can with pliers and set on floor.
- 8 - Get mixer from thinner tank and mix paint for 30 seconds.
- 9 - Pour specified amounts of paint into paint can.
- 10 - Mix two part paint with mixer for about 30 seconds.
- 11 - Place mixer in thinner tank and operate a few seconds to clean it.
- 12 - Pick up inner pail with pliers and place in paint can.
- 13 - Place cover on paint can and tighten with screwdriver or putty knife.

A.7.3.4 Mix Paint - One Part

- 1 - Open can by removing cover with screwdriver or putty knife.
- 2 - Place mixer in thinner tank and operate mixer for 5 seconds.
- 3 - Move mixer to paint pail and mix paint for 30 seconds.
- 4 - Place mixer into thinner tank and operate mixer for 5 seconds.
- 5 - Pour paint into paint can.
- 6 - Place cover on paint can and tighten with screwdriver or putty knife.

A.7.4 Plural Component System

A.7.4.1 Plural Component System - Set Up

- 1 - Make sure lever at the incoming air regulator at back of system is turned clockwise to off.
- 2 - Turn air regulator all the way out.
- 3 - Slowly turn on air.

- 4 - Turn air regulator in so that the gauge reads 80 PSI.
- 5 - Turn lever to ON (down) at both paint pumps.
- 6 - Make sure thinner valve is shut (turn clockwise).
- 7 - Make sure both needle valves are turned all the way in to the closed position.
- 8 - Push double valve lever forward.
- 9 - Check two pump regulators to make sure they are at the same setting.
- 10 - Plural component system is ready to use for spraying.

A.7.4.2 Plural Component System - Teardown

- 1 - Back out main air regulator until the gauge points to zero PSI and pressure is released.
- 2 - After pressure is released, pull double valve lever back to close paint valves.
- 3 - Open thinner valve (turn counter-clockwise).
- 4 - Turn on thinner pump (turn lever down).
- 5 - Open one needle valve (make sure the other needle valve is closed).
- 6 - Run thinner through until all the paint is out of the line.
- 7 - Close first needle valve.
- 8 - Open second needle valve.
- 9 - Run thinner through lines until all the paint is out.
- 10 - Open first needle valve.
- 11 - Run thinner through both lines.
- 12 - Close thinner valve (turn lever clockwise).
- 13 - Turn off main air supply to plural component system.

A.7.4.3 Change Paint Drums on Plural Component System

- 1 - Disconnect air hose from agitator and connect it to piston.
- 2 - Wait for agitator and pump to raise.
- 3 - Turn agitator and pump 18~ degrees over other drum.
- 4 - Pull lever and guide agitator and pump into new drum.
- 5 - Disconnect hose from piston and connect to agitator.

A.8 Drying Oven

A.8.1 Drying Oven - Start

- 1 - Turn on waterfalls #5 and #6. (Note: Oven cannot be started unless waterfalls are on.)

- 2 - Turn master switch to ON at control panel in the power room between Blast and Paint Shops.
- 3 - Push START button on control panel.
- 4 - Wait until OVEN PURGE (blue) light comes on.
- 5 - Push HEAT button.
- 6 - Temperature is set at 250 degrees - do not change.
- 7 - Load parts on table at oven.
- 8 - Spray parts on table.
- 9 - Push CYCLE START button at oven and align table with paint mark on floor and release.
- 10 - Timer is set for 10 minute cycle. (Epoxies take 10 minutes to dry; enamels take 3 minutes to dry).
- 11 - The oven automatically opens and closes doors and moves carts on the track.
- 12 - Repeat cycle when light comes on.

A.9 Blast Procedure - Blast Booth

A.9.1 Set Up Procedure for Blasting

A.9.1.1 Set Up Operator

- 1 - Put on coveralls.
- 2 - Tape wrists and ankles of coveralls.
- 3 - Put in earplugs.
- 4 - Put on hardhat liner.
- 5 - Place blasting helmet on head.
- 6 - Put on gloves.

A.9.1.2 Set Up Blasting Equipment

- 1 - Turn on two blowers, push START button for each blower.
- 2 - Turn on two hoppers, push START button and turn on power switch.
- 3 - Fill hopper to top of glass window of hopper.
- 4 - Turn off hopper, push STOP button and turn off power switch.
- 5 - Turn on main air lever.
- 6 - Turn on air valve at hopper inside blast booth for switch on blast nozzle.
- 7 - Turn on air valve for fresh air in helmet located by the blaster.
- 8 - Turn on switch and push button for light at blast nozzle.

A.9.1.3 Teardown Blaster

- 1 - Turn off switch and push button to turn off light at blast nozzle.
- 2 - Remove helmet and turn off air valve for fresh air.
- 3 - Turn off air valve at hopper inside blast booth.

- 4 - Turn off main air lever.

A.9.2 Vacuum Recovery System

A.9.2.1 Set Up System

- 1 - Turn on air, move lever in up position.
- 2 - Turn on power.
- 3 - Push START button.

A.9.2.2 Teardown System

- 1 - Push OFF button.
- 2 - Turn off power.
- 3 - Turn off air, move lever down.

A.9.2.3 Clean Out Vacuum

- 1 - Open bottom hatch - turn counter-clockwise.
- 2 - Scrape out inside with scraper.
- 3 - Close bottom hatch - turn clockwise.
- 4 - Clean out waste bucket and replace.

APPENDIX D

MATERIAL MOVE REQUEST

In an effort to initiate improvements to obtain better control of the handling of loose parts through the blasting and painting operations, a Material Move Request card is being proposed.

The Material Move Request card is a record of the movement of parts between departments. It is composed of three copies, the first two are reproducing copies that duplicate the information written on the first copy to the second and third. The third copy is a tag to be attached to the material for identification by the sending department. The first copy is given to the move man (trucker) by the sending department. The trucker passes it on to the scheduler in the department receiving the parts. The second copy is retained by the sender for his records. Each skid load to have a separate material move request.

The purpose of the Material Move Request is to:

- 1) Authorize the move of materials between departments.
- 2) Inform the department receiving the Material Move Request that they have the parts to work on.
- 3) The sending department has a record of when and where the parts were sent. The two departments have records and know where the material is.
- 4) The card copy identifies the material at all times should it get lost.
- 5) The scheduler receiving the first copy can proceed to schedule the work per the requested completion date.
- 6) Better flow of material through the department is possible as the work can be scheduled in a systematic way to satisfy time dates for following operations.
- 7) Will be used to provide information to fill out a job card to do the work.

BLAST/PAINT JOB CARD

The job card is a record of the work accomplished on a job. It also provides information about the job to the worker.

The top section of the job card is filled in by the Scheduler, whereas the bottom section is filled in by the worker.

The job card would have two copies. The first a paper copy will reproduce the second, a card copy. The first copy is retained by the Scheduler as a record of the status of the job. The second copy goes to the worker authorizing that person to do the job. All job cards on jobs whether completed or not are turned in at the end of the shift. Only the number of parts completed should be indicated on the job card. The Scheduler is to have the next days job cards ready at the start of the shift, which will include a new job card for a job over eight hours.

The purpose of the job card is to:

- 1) Provide information to establish work schedules and set up priorities.
- 2) Give the worker knowledge of what must be done on the job.
- 3) Provide information of work completed and who did the job.
- 4) Inform the Scheduler when to move the job to the next department and initiate the Material Move Request.

This job card can serve other purposes such as provide information that can be used for supervisory and management reports.
