14. ABSTRACT We found that CWS can do a reasonable job of capturing expertise in arithmetic compared to indices that incorporate correct answers. We also found (in conjunction with Rick Thomas and Alex Kirlik) similar results for a performance domain, putting a golf ball. In addition, we initiated the development of designs that allow the extraction of individual performance from team scores. We used the CTEAM simulation to study the development of expertise of teams of simulated air traffic controllers. CWS served as the primary index of performance, although traditional measures were examined as well. As a performance measure, CWS (based on time through sector) was observed to be more sensitive to improvement over practice than operational errors. Experts make too few errors to provide differential accuracy information, while CWS attends to aspects of performance that can always be observed, whether errors are made or not.

Objectives: Our goal was to explore the utility of the CWS index of performance, and to apply that index to team performance.

Key Findings: We found that CWS can do a reasonable job of capturing expertise in arithmetic compared to indices that incorporate correct answers. We also found (in conjunction with Rick Thomas and Alex Kirlik) similar results for a performance domain, putting a golf ball. In addition, we initiated the development of designs that allow the extraction of individual performance from team scores.

We used the CTEAM simulation to study the development of expertise of teams of simulated air traffic controllers. CWS served as the primary index of performance, although traditional measures were examined as well. As a performance measure, CWS (based on time through sector) was observed to be more sensitive to improvement over practice than operational errors. Experts make too few errors to provide differential accuracy information, while CWS attends to aspects of performance that can always be observed, whether errors are made or not.

At the individual level, initial (untrained) skill superiority was maintained over trials. Moreover, training yielded skill superiority that was not overcome with practice. Thus, with individuals, rank orders of performance were maintained whether initial superiority was produced by individual differences or by training.

A similar picture emerged for team training. That is, initially superior teams maintained their advantage over trials. Although, inferior teams generally improved with practice, they did not catch up to the superior teams. As with individuals, final rankings were highly correlated with initial rankings.

Personnel supported: The PIs (Weiss and Shanteau) received support for the summer months. At CSULA, Kristin Brennan was supported and she received an M.A. degree in 2006. Lydia Jennings also received some support, and she is expected to receive an M.A. degree in 2007. At KSU, John Raacke and Brian Friel were supported and they received Ph.D. degrees in 2004 and 5, respectively. Christopher Barlett, Christopher Vowels, and Margo Voller received support during their pursuit of Ph. D. degrees. Several undergraduates were supported as well.
