14. ABSTRACT In a disease outbreak medication needs to be rapidly yet safely distributed to a population to minimize infection outbreak. We investigated if there are significant differences in efficiency (time) and error rates in drug dissemination to large groups of people using algorithm driven paper vs. PDA methodology. Subjects were sent through points of dispensing with volunteer clerks processing them during two sessions (alternating modes for session two). Time to process subjects through each arm was recorded, along with the errors in medication prescription. Data analysis indicated no significant difference in time or number of errors made with PDA vs. paper methods. However, the mode and order of testing affected time. Clerks doing the paper method second were slower than those who did paper first (P = 0.001). The PDA method was consistent in time whether clerks used it first or second. This may indicate the presence of a fatigue factor from using the paper method. Both methods require questions to be asked, but the PDA requires less thinking as one only plugs in answers to questions, whereas the clerks using paper must also interpret the answer and follow the paper-based algorithm. This may have resulted in slower times as fatigue played a role in the second session. The findings may indicate that during a disease outbreak, when clerks are tired yet still must continue processing citizens, an algorithm-driven PDA may be beneficial to improve efficiency.

INTRODUCTION

In a biological attack or infectious disease emergency medication needs to be rapidly yet safely distributed to a large population to minimize infection outbreak. We trained volunteers in the use of technology that included the use of Personal Digital Assistants (PDAs) to study whether an algorithm-driven PDA could improve efficiency and safety of medication distribution vs. a more traditional paper decision flow chart method. If equal or effective, other benefits could be gained from electronic storage of data including easy retrieval and logistics of medication dispensing. The research question of interest in this study was: Are there significant quantifiable differences in efficiency (time) and error rates in drug dissemination to large groups of people in a disease outbreak scenario using a paper decision-tree method vs. PDA-assisted method? For this study 30 volunteers (mock citizens each reading a total of 128 identities to clerks) were sent through points of dispensing (PODs), with 30 volunteer clerks processing these subjects. Data gathering consisted of two sessions during a mock disease outbreak. For the first session, half the clerks processed citizens using the paper method and the other half processed citizens with the PDA. For the second session the clerks switched modes and processed citizens using the alternate method. Each volunteer clerk received the same training and saw the same subject identities (64 in each session). Time to process subjects was recorded with a stopwatch along with the prescription generated by the clerk for each identity. The correct antibiotic for each citizen identity was kept on a master answer sheet for later comparison. PDA answers were automatically uploaded to a database while paper version answers were recorded manually on identity-coded flowcharts. The following sections will describe the events, results, and accomplishments of this study. With validation through this project the Patient Medical Assistant (PMA) system could be utilized for the purpose of training volunteers and managing emergency events. As such the tool also has widespread application for homeland defense and bioterrorism preparedness.

BODY

The following section describes the research accomplishments associated with each task outlined in the approved Statement of Work (SOW). The SOW is as follows:

Task 1: *Provide the technical environment, systems, technical evaluation, and validation to enable the Mass Medication Clinic (MMC) to operate effectively.*

This task was accomplished through the following steps:

Provide a technical environment where the MMC can operate effectively

- Procured server hardware, server systems, network hardware and networked PDAs.
- Installed hardware and systems infrastructure.

Provide systems for determining the distribution of mass medications.

- Developed data repositories.
- Developed data access protocols and methods.
- Developed server-side user interface to view captured data.
- Developed PDA application for gathering data.

Evaluate the technical aspects of the system

- Procedures performed per hour were evaluated.
- PDA failures were evaluated and problems fixed.
- Local network failures were evaluated and problems fixed.
- Data transfer error rate was evaluated and problems fixed.

Validate the use of the MMC/PMA system.

- Alpha and Beta testing of software and hardware were conducted at the CTA facility. Final tests to verify the system occurred during two dry run rehearsals. Hardware and software worked perfectly and as planned without failure or errors and were ready for the actual study data-gathering activity.

In June of 2006 the CTA/UH team met together to diagram the various PDA screens that would lead a volunteer through the algorithm-driven process (the same algorithm as appears on the paper flowchart currently in use by the Hawaii Department of Health – see Algorithm, Appendix 1). All screens were diagrammed during this meeting. Based on the PDA screen diagrams, CTA developers then began detailed development of the actual configuration of the screens. After initial design work, the CTA developers commenced software development. PDA server software was then developed and tested. Alpha and Beta of software and hardware systems was then completed. By February 2007 final steps were completed (including verification during the dry runs) for the study to begin in March 2007.

The server was initially used to store the initial data configuration that was later installed onto each PDA. During operational use at the time of the mock disease outbreak, the server acted as an aggregation point for data collected by the PDAs and by any workstations connected to the system. It periodically copied data to a central data repository.

The PDAs had the necessary software installed. This included the screening application, the data gathering application, the on-board database, and the data transfer application. During operational use each PDA operated in an independent, disconnected fashion. It stored the collected data in its own database and automatically, on a periodic basis, transferred that data to the POD server as communications links allowed.

The communications technology can be deployed with each POD at the time of an incident and can allow many PDAs and workstations to connect with the server at one time without the need for cables or available ports. The PDAs use this connection to transfer their collected data to the server as they are able to make a connection. If a wireless connection cannot be made for some reason, the PDAs can transfer their data by being cradled to one of the workstations, or by downloading of data from PDA to portable storage device to local PMA server. The workstations can connect to the server via cable or a wireless connection.

During our study the data was transmitted from the PDAs to the server periodically. Making sure the data transfer is complete was a technical objective. In a real situation, the success of archiving is important as this archive will contain totals and information for statistical analyses (e.g., the number of people coming through, the medication they receive, how many are pregnant at the time, tracking of people as to who received what medication). This information is useful for re-stocking of medications, tracking of people (for example, if a certain disease is resistant to one of the drugs, the health department could immediately identify the affected population), and for future planning. The electronic data that will be stored on the servers can be utilized for operational needs. As our project included a scripted exercise to evaluate efficiency and accuracy of processing, the data saved for the current protocol has no research use other than to address the research questions identified in the proposal, since the data being collected has been defined for the exercise.

The data flow is described as follows:

1. The technician used the Diagnostic Application on the PDA to perform screening of patients for exposure to dangerous elements, prior conditions, current medications, etc.
2. The Diagnostic Application queried the PDA Database for the proper diagnostic procedure depending on the patients responses to questions asked. The database also stored the patient's responses for later recordkeeping and analysis.
3. At periodic intervals, the Data Transmission Application checked for an available connection and uploaded the collected data from the PDA to the POD Server through the Web Service through an available connection. (in a real emergency, if a connection is not available, the Data Transmission Application will wait a specified period of time and try again).
4. The Web Service used standard XML and Internet protocols to receive data transmitted from the PDAs. It immediately stored the received data in the Server Database.
5. The Server Database used standard database structures in normalized form to store and retrieve data.
6. The Data Review Application is a web-based application that can be accessed from any computer on the network by any authorized person. It provides aggregated statistics on the patients processed through the POD, the procedures performed, and the medications dispensed.
7. The Data Upload Application was used to send the data collected in each POD to a central server for later recordkeeping and analysis.
8. The Central Database is a permanent repository for data collected during each incident in which the PODs are mobilized.

During the course of the actual study (data collection), the 15 PDAs worked well with the exception of one PDA that malfunctioned and had to be replaced with a back-up. This occurred near the end of the study. The data uploading worked well and the massive data set generated was impressive (see supporting data, PDA Uploaded Data).

Task 2: *Determine the relative efficiency (time savings) as well as the type and dosage error rates in dispensing of medication between the paper processing system and the PDA processing system in a Mass Medication Clinic scenario. It is expected that the PDA system will demonstrate significant time savings allowing for more people to be processed in a given period of time. It is also anticipated that both type and*

dosage error rates will be lower with the PDA system than with the current paper processing system.

The HRPO (USAMRMC) approval memo was granted 12 February 2007, thus enabling the team to proceed with data collection. The data gathering date for this project was set for 3 March 2007 (with a back-up date of 17 March).

Final preparations for the data collection day took place over the course of two months prior to that date (January and February 2007). These preparations included:

- Volunteer subject recruitment and volunteer confirmation
- Periodic communications with all volunteers via e-mail regarding study day instructions and map, parking information, re-confirmation the night before the study, etc.
- Purchase of study materials (stop-watches, clip boards, pens and related supplies, gift cards)
- Preparation of all training packets, patient identity packets, coded flowcharts, patient trays, clerk trays, volunteer handouts (including information/consent form – see Appendix 2) patient/clerk chair signs, room door signs, volunteer rosters, volunteer ID badges, staff worker (monitors) ID badges, staff clip board (monitoring) instruction packets (see Monitor Packet, Appendix 3).
- Preparation of formal power-point presentation for initiation of volunteer research subjects.
- Two “dry-run” rehearsals with staff participating in running the study. This included viewing of the formal presentation, working the stop-watches, viewing the dynamics of clerk-patient encounters, working the PDAs.
- Planning breakfast items and bento lunches, arranging for their purchase
- Planning chair/table set-ups for the rooms used for the study (the actual physical arrangement of furniture took place the night before the study day).

The data collection scenario (mock disease outbreak) was modeled after Bioterrorism exercises routinely conducted at the Hawaii Department of Health (DOH), processing mock subjects through points of dispensing (PODs), with volunteer laypersons as processing clerks who process mock patients with a paper-based algorithm that determines which type and dose of antibiotic the individual needs. Our study also included the same algorithm in a PDA that would figure the type of antibiotic and dose and also

upload the data into a server. The overall study goal was to investigate differences in paper vs. PDA in the processing of mock subjects by volunteer clerks in terms of time and errors in processing.

The mock outbreak exercise was held at the University of Hawaii, John A. Burns School of Medicine on 3 March 2007. Seventy Department of Health employees were scheduled to arrive in the morning – 60 study participants and 10 alternates (in case of “no-shows”). Upon arrival, the necessary substitutions with alternates were made, excess alternates sent home, and the study was ready to commence with the 60 required volunteers.

Dr. Lawrence Burgess and RD Clyde presented a formal PowerPoint overview (study goals, information/consent form (see Appendix 4), roles/responsibilities, procedures, PDA overview) to the volunteers. Prior to the data gathering activity, RD Clyde, and Dr. Burgess and Dr. Garshnek, together with various staff, conducted the initial paper algorithm and PDA training of the volunteers (see Sample Training Packets, Appendix 5).

The group of 60 volunteers was randomly divided into 30 clerks and 30 mock patients (each volunteer patient assumed 64 different identities during each session) (see Master ID, Appendix 6). Data gathering consisted of two sessions: (1) 15 clerks processing patients with an algorithm driven PDA and, in another room, 15 clerks processing patients using the paper-based algorithm, (2) after the first session, the clerks’ switched rooms, received brief refresher training, and used the alternate method to process patients. The time to process mock subjects through each arm was recorded with a stopwatch, along with data indicating the errors in medication dissemination. After each session, the clerks completed an evaluation of their perceptions about the training received, processing method, and an evaluation comparing the two methods. After the two data gathering sessions were completed, lunch was served and gift cards distributed, thus ending the data-gathering day.

During the data gathering activity, the PDA data was periodically uploaded wirelessly to a database in a server at the CTA facility. A massive data table was automatically generated and available electronically and immediately after the mock outbreak exercise. The paper-based method data had to be entered manually. This took people 10 hours each to accomplish and was added to the existing data table with the PDA data – ready for analysis.

Methods/Data Analysis:

The study is a one-way, completely crossed repeated measures design. The predictor variable is the system of determining the correct medication to dispense. It has two levels, i.e., paper processing and PDA processing. All subjects used both the paper and PDA processing methods to determine the correct medication to dispense. Presentation order for method of processing was completely counterbalanced, i.e., half of the subjects used the paper processing method first followed by the PDA processing method and the remaining half of the subjects used the PDA processing method first followed by the paper processing method. The combinations of characteristics used by the treatment algorithm were used to construct 64 mock "patient" identities. Patient identities were randomized and processed equally by both methods.

The study collected the following outcome measures:

- 1) The time to process each individual "mock" citizen.
- 2) The number of errors made in the type or dosage of medication prescribed. A medication type error was made if the medication prescribed during the exercise differs from what the treatment algorithm prescribed for that identity. A medication dosage error was made if the medication dosage prescribed during the exercise differs from what the treatment algorithm prescribes for that identity.

Inclusion/Exclusion Criteria:

Inclusions:

- Aged 20 years and older
- English speaking
- Agree to sign a consent form
- Normal vision (self reported normal or corrected to normal with glasses or contact lenses)
- Normal hearing (self reported normal or corrected to normal with hearing aid)

Exclusions:

None

Sample Size:

The most important objective of this study was to determine the relative efficiency or time savings of the PDA system of dispensing medication compared to the paper-based system. The minimum number of cases needed per level to determine if patients on average can be processed quicker with the PDA system than with the paper-based system is 64 (effect size $f = 0.25$, α (two-tailed) $= 0.05$, power $= 0.90$). Thirty clerk volunteers and 30 mock citizens (reading a total of 128 identities) participated in the study. All clerk volunteers processed 64 cases with paper and 64 cases with the PDA-based method, or a total of 128 per clerk volunteer (a total of 3840 observations recorded).

Data Analyses:

Means, standard deviations, frequencies, proportions, and graphical displays were computed for the study variables. In addition, plots of longitudinally measured variables were constructed to understand their general trends over the study period. Statistical comparisons were performed using two-sided tests at the standard 0.05 significance level, supplemented with the use of confidence intervals. Statistical analyses were performed using SPSS 14.0 (SPSS, 2005). The time and error data (see supporting data, summarized raw data tables) were analyzed using a univariate analysis of variance, with outliers removed (these were statistical outliers who had difficulty performing the tasks. Removal of them did not change the results of the final analyses). PDA time data were adjusted due to an extra weight question, appearing as the first PDA question, that did not need to be asked (and was not initially asked in the paper method).

Data analysis indicated no significant difference in number of errors made with PDA vs. paper methods (see supporting data, time and error analyses tables). In terms of efficiency (time) overall, no significant difference was found in paper vs. PDA methods. However, the mode and order of testing affected time (see supporting data, mode x presentation order graph) -- clerks doing the paper method second were slower than those who did paper first ($P = 0.001$). The PDA method was consistent in time whether clerks used it first or second. A possible explanation may be the presence of a fatigue factor resulting from using the paper method. It is postulated that processing with the PDA requires less thinking than the paper method as one plugs in answers to questions whereas following a flowchart takes some additional thinking. This may have resulted in slower times as fatigue played a role in the second session. The findings may indicate that during a major disease outbreak, when clerks are

tired yet still must continue processing citizens, use of an algorithm-driven PDA may be beneficial to improve efficiency.

KEY RESEARCH ACCOMPLISHMENTS

The following bulletized list of accomplishments offer a quick look at what was gained as a result of this study:

Task 1:

- A methodology for developing an algorithm-driven PDA to generate customized prescriptions for citizens during an infectious disease outbreak.
- Algorithm-driven PDAs that are flexible and can be expanded and enhanced by reprogramming to add new features.
- Successful periodic uploading of data from the PDA to a server that generates a comprehensive data table for analysis (see supporting data, PDA Uploaded Data).

Task 2:

- Successful comparison of PDA-assisted prescription generation vs. flow-chart paper method. Our team was the first to comprehensively study this particular comparison via a well-designed research project. The methods used were successful and can be used by other researchers to evaluate other e-health technologies that are planned for improving existing, non-technical methods.
- We have added new knowledge to the existing body of Telehealth studies. It was expected that the PDA system will demonstrate significant time savings allowing for more people to be processed in a given period of time. It was also anticipated that both type and dosage error rates will be lower with the PDA system than with the current paper processing system. However, our findings found no significant difference in time or number of prescription errors in PDA vs. paper methods. This demonstrates that although we *intuitively* believe that technology will provide greater efficiency and accuracy, this is not always the case.
- A new research question was generated: Since we did find that clerks doing the paper method second were slower than those who did paper first ($P = 0.001$), is there a fatigue factor causing this? Answering this question properly would require an additional study of a longitudinal nature.

REPORTABLE OUTCOMES

- Ten PDAs configured with the algorithm and enhanced functions (to calculate medication dosage based on weight), have been given to the Hawaii Department of Health, complete with instructions of use and training materials to rapidly train individuals in its operation should an outbreak or bioterrorism attack occur on Oahu.
- Sixty Hawaii Department of Health volunteers participated in the study and have been trained in both the use of the PDA and paper method of medication dissemination. Survey feedback from volunteers indicated that our training methods were excellent and thus these methods can be used in a future outbreak situation.
- Information on server configuration has also been provided to the Department of Health so that they may upload information from the PDAs directly into a database of their own for later analysis and inventory.
- An abstract has been submitted to the 2007 Hospital of the Future Conference (Annual Theme: Towards responsibility and compliance in the innovation and management of healthcare technologies: international perspectives and comparative experiences). The conference will be held October 3-5, 2007, at the Scuola Superiore Sant'Anna in Pisa, Italy. The abstract deadline was 8 June and the abstract is attached in Appendix 7. A brief paper for presentation will be generated (with proper reference to funding source) to appear in the conference proceedings.
- A full paper is in preparation for submission to the *Journal of Disaster Medicine and Public Health Preparedness*. The paper will include the literature review (see Appendix 8), project description, and analyses of the data (with proper reference to funding source).
- A poster presentation (or full presentation/panel discussion) is in the planning stages for the 2008 American Telemedicine Association Meeting.

CONCLUSION

In summary, the implications and importance of the completed research point to the strength of the algorithm, in that PDA and paper methods were similar in their results (time and errors). The strength of the PDA over paper is the ability to upload data into a database for future analyses, inventory, or research, which cannot be effectively captured by utilizing the current paper method of processing individuals to obtain necessary medications during an emergency. PDAs also are more mobile (by hanging them around the neck, the operator can be "hands free" to distribute

medications, weigh people, assist the elderly or children, etc., which offers an advantage over laptop or stationary computers. The PMA System is designed such that it is able to be set up quickly in different geographic locations and settings with a variety of potential infrastructure challenges (availability of electricity, connectivity, etc.). Since the PMA system is easy to activate and employ, it enables non-technical staff to set up the PODs.

Our team was the first to compare the use of an algorithm-driven PDA with paper method in a mock disease outbreak scenario. Previous to our study a similar type of approach was used with laptop computers (ref. 1) but comprehensive data was not gathered, nor were statistical analyses performed.

The question of interest in our study was: Are there significant quantifiable differences in efficiency (time) and error rates in drug dissemination to large groups of people in a BT scenario using a paper tracking method vs. PDA-assisted method? We postulated there will be improvement in efficiency with PDA over paper. Error rates in prescribing will be less with the PDA than with paper; the PDA will be more efficient than paper in distributing the medication. However data analysis indicated no significant differences in number of errors or time. Historically, e-health research has sometimes shown that applying technology to a problem (such as, in our case, wishing to reduce the time spent and error rate in processing people and disseminating medications, over an existing non-technical method), does not always yield an improvement. Indeed, such was the case in our study. But technology does give the users an advantage in *organizing and archiving the data* and having immediate access to it (that is where a later "time savings" can occur in this case).

Our data did provide another interesting finding – that the mode and order of testing affected time. Clerks doing the paper method second were slower than those who did paper first ($P = 0.001$). A possible explanation may be the presence of a fatigue factor resulting from using the paper method. It is postulated that processing with the PDA requires less thinking than the paper method. This finding may indicate that during a major disease outbreak, when clerks are tired yet still must continue processing citizens, use of an algorithm-driven PDA may be beneficial to improve efficiency. The idea that a fatigue factor may have been responsible for some slowing of the clerks is an interesting one and would need to be properly investigated in a longitudinal study.

CONSENT TO PARTICIPATE IN RESEARCH

Mass Medication Clinic (MMC) Patient Medical Assistant (PMA) System Training Initiative

Principal Investigators: RD Clyde, CTA, Inc., 550 Paiea St., ste 222, Honolulu, HI 96819, Phone: 808-839-1200; Co-Is: Victoria Garshnek, Ph.D and Lawrence Burgess, M.D, Telehealth Research Institute, 212 John A. Burns School of Medicine, 651 Ilalo Street Honolulu, HI 96813, Phone: 692-1080

You are being asked to participate in a research project about the use of Personal Digital Assistants (PDAs) to improve efficiency and safety of medication distribution. Your participation in this study is voluntary.

If you volunteer to participate in this study, we would ask you to do the following things:

This training will send mock subjects through points of dispensing (PODs), with volunteers (clerks) that process subjects to receive correct medications. Each volunteer will receive the same training and see the same number of subject identities and manage the same number in each arm of the study. Time to process subjects through each arm will be recorded, along with the errors in subjects receiving the correct antibiotic. Technical aspects will also be evaluated.

Although you may not receive direct benefit, your participation will help us learn if the rapid procedure developed to disseminate medications in an emergency can potentially save many more lives than the current system used

All project volunteers will receive payment (\$20 an hour for the five hour period of training and the study portion, including breaks). Also a lunch will be provided

This project is anonymous. No record of your identity will be asked for or kept. When the results of the research are published or discussed in conferences, no information will be included that would reveal your identity. If you choose not to participate, that will not affect your relationship with the University of Hawaii. If you decide to participate, you are free to withdraw your consent and discontinue participation at any time without prejudice. If you decide to withdraw from the research, you will not be paid for those hours in which you did not participate.

If you have questions about this research you may contact the Investigators listed above. If you have questions regarding your rights as a research subject, you may contact the University of Hawaii Committee on Human Studies; 2450 Maile Way/253, Honolulu, Hawaii 96822; Phone: (808) 956-5007 or uhirb@hawaii.edu

This study is sponsored by the Department of Defense. Representatives of the U.S. Army Medical Research and Materiel Command are authorized to review research records as part of their responsibility to protect human research volunteers.

Appendix 3: Monitor instruction packet

Sample

Name of Monitor: John

Room 301

(stay in this room the entire study)

You will oversee:

Session A: Clerks 22, 23, 24

Session B: Clerks 7, 8, 9

Study Chronology

1. Introduction by Dr. Burgess

Room 304 (room with food)

2. Training Sessions

After the overall introduction the volunteers will split up according to the following:

Room 301 (PDA room)

#1-15 and #31-45

Room 302 (Paper room)

#16-30 and 46-60

Proctors will go to their assigned room (front sheet of clipboard)

The following will occur:

a. Training session (no stopwatch).

Volunteers will pair off and sit opposite one another at a pink/blue station. With the help of the proctors, one volunteer will be a clerk and the other a patient (or “reader”). They will go through one small training packet (of 3 identities) and learn the motions of the task.

They will then take another small training packet and reverse roles so that both can learn each job.

b. Training session (no stopwatch) switch rooms

Next the clerks will switch rooms (patients and monitors stay in same room).

Room 301 (PDA room)

#16-30 and #31-45

Room 302 (Paper room)

#1-15 and # 46-60

They will repeat the exercise as before to learn the new method (using the training packet labeled “New Group”).

The groups are actually in the rooms where they should start session A. At this point, we will tell them that # 1 through 30 are “clerks” and #31-60 are “Patients” or readers.

At this point the clerks will go to their assigned station (clerk #1 sits at C-1, clerk #2 sits at C-2, etc. Patients can sit anywhere they choose opposite a clerk.

b. Timed training session (with stopwatch)

Now will come the training to benefit the clerk directly. The patient will take the “timed practice” packet out of the blue box and zero the stopwatch. When the room supervisor says “begin”, all will start their stopwatches and the clerks will begin to ask their questions. The reader will give answers according to the identities in the packet. After the 3 identities are finished and the clerk is finished with the final answer, the patient stops the watch, records the time and their number on the coversheet, and tosses the packet into the pink “finished” box.

Once the clerk and patient feel comfortable (and they may practice more if they like), the actual study session A can begin.

3. Session A

The method will be exactly as the timed training above except each packet will have 8 identities. Once those 8 have been processed, the patient stops the watch and records the time. Once all couples have finished, the patients move over (move right) one seat to read for a new clerk.

There are 8 such packets for session A. Therefore, the patient will record time 8 times. When all 8 packets are done, the patients go to lunch and the clerks fill out the EVALUATION (in the blue box). Then they go to lunch.

4. Break

5. Session B

The clerks will sit in their assigned seats and patients can sit anywhere they choose.

The patient will take the “timed practice” packet and the couple will practice with a stopwatch. After the clerks feel comfortable, Session B will begin.

Session B will proceed as session A except the clerks will use a different method and be in a different room.

After all 8 packets are processed, the clerks do the final EVALUATIONS.

6. Badges are traded for a gift card.

7. *Lunch*

Proctor Responsibilities:

1. During training, check the clerk’s answer with your answers (in your clipboard)
2. During the actual study, make sure stopwatch is “zero” before start of each timed packet activity (there will be 8 packets per session)
3. After a packet is done, make sure patient records time and pt. # on coversheet and tosses packet into pink “finished box
4. Make sure Clerk tosses each finished flow chart into “finished box”
5. After session A is done, make sure the Clerk does the ***Evaluation*** (in the blue box) before going to lunch (and toss in “finished box”)
6. Anytime during the study, if there are problems worth noting that can affect study data, note these on the “problem sheets” provided in your clipboard.

For session B you will be supervising 3 new clerks

7. There will be another “practice” session

7. After session B is over, make sure clerk finishes ***evaluation*** and tosses into pink “finished” box.
8. After session B is over, collect the 3 stopwatches from your 3 corresponding patients.
9. Remember: All paper from the blue box will eventually end up in the finished box. There will be no stray papers floating around during the study.

Answers to training and practice sessions

For Training Session (PDA or Paper are same)

Sheet 1 (code 29):

CIPROFLOXACIN 500 MG PO BID FOR 10 DAYS WITH FOLLOWUP

Sheet 2 (code 47)

STOP PROBENECID TEMPORARILY; DECREASE THOPHYLLINE DOSE 50%; CIPROFLOXACIN 500 MG DQD AND REFERRAL TO PHYSICIAN FOR DOSE ADJUSTMENT AND MONITORING

Sheet 3 (code 64)

DOXYCYCLINE 2.2 MG/KG PO BID FOR 10 DAYS WITH CAUTION

For “Timed Practice” (PDA or Paper are same)

Sheet 1 (code 5):

DOXYCYCLINE 100 MG BID 10 DAYS WITH CAUTION

Sheet 2 (code 38)

STOP PROBENECID TEMPORARILY; DECREASE THEOPHYLLINE 50%; CIPROFLOXACIN 10-15 MG/KG PO BID FOR 10 DAYS WITH FOLLOWUP

Sheet 3 (code 57)

Appendix 4: Research Day Presentation to Volunteers

Infectious Disease Outbreak: Medication Dispensing

Lawrence P.A. Burgess, MD

Dir., Telehealth Research Institute, UH-JABSOM

RD Clyde

PI, CTA Solutions

Victoria Garshnek, PhD

Co-PI, Telehealth Research Institute, UH-JABSOM

TRAINING and EXERCISE

- 800-830 am: Overview, demos, consent form
- 830-915 am: Training (all trained)
- 915-925 am: Break
- 925-1100 am: Study session A
- 1100-1130 am: Lunch
- 1130 am-105 pm: Study session B

STUDY PURPOSE

- **Infectious disease outbreak:**
natural or engineered (bioterrorism)
- **Disease spread:** can be rapid, fatal
- **Medication:** can stop disease spread
- **Medication:** supplied at Points of Dispensing (PODs)
- **PODs:** dispense meds quickly, safely
- **STUDY:** best way to dispense meds?

METHODOLOGY

- **Mock Exercise:** dispense correct meds
- **Compare:** Paper process VS. PDA process
- **2 Groups:** A. Paper first, followed by PDA
B. PDA first, followed by paper
- **Participants:** CLERKS or READERS
- **READERS:** read off of card, posing as different patient identities, keep time
- **CLERKS:** follow decision tree on paper and PDA

METHODOLOGY

CONDUCT OF STUDY:

1. READERS AND CLERKS:

- *concentrate on this interaction*
- *paper and PDA process*
- *information from card, not person in front of you*

2. STUDY MECHANICS (less important, will learn in training, proctors will assist): packets of materials, tearing off sheets, keeping time, filling out surveys

CONSENT FORM

- Study: PDA to paper for dispensing of meds
- Participation voluntary. Can withdraw anytime
- May not get direct benefit, study results may help others
- All results anonymous
- No record of your performance discussed with your employer; No list to your employer
- Compensation (gift certificates) for your hours of participation

DEMONSTRATION

- **PAPER:** follow flow, circle final shaded box.
Also circle heavy dotted circle as needed.
- **PDA:** just follow questions on the screen,
click on answer with stylus (pen)

SEE FLOW DIAGRAM ABOVE

FOLLOW ON YOURS

DEMONSTRATION

■ SAMPLE PATIENT 1:

- ALLERGIES? (No)
- WEIGHT? (155 lbs)
- AGE? (77)
- GENDER? (Male)
- Pregnant or Breast Feeding? (No)
- Taking other Medications? (No)
- Kidney Problems? (No)

DEMONSTRATION

CLERKS first Question:

“Are you allergic to tetracycline?”

- Reader's paper has
1 of 4 responses

Allergies? (No)

Allergies? (Tetracycline)

Allergies? (Quinalones)

Allergies? (Tetracycline, Quinalones)

READER's
response

“No”

“Yes”

“No”

“Yes”

- **GENERAL RULE 1:** If unsure of what to say, just read what is on your paper.

DEMONSTRATION

1st Q: “Are you allergic to tetracycline?” “No”

2nd Q: “How old are you?”

■ Reader's paper has
1 response

Age? (77)

READER's
response

“77 years old”

■ **GENERAL RULE 2:** Reader gives age or weight, and Clerk interprets age and follows appropriate path.

DEMONSTRATION

1st Q: “Are you allergic to tetracycline?” “No”

2nd Q: “How old are you?” “77 yrs old”

3rd Q: “Are you male or female?”

■ Reader's paper has

1 of 2 responses

Gender? (Male)

(Female)

READER's

response

Male”

DEMONSTRATION

1st Q: “Are you allergic to tetracycline?” “No”

2nd Q: “How old are you?” “77 yrs old”

3rd Q: “Are you male or female?” “Male”

Doxycycline 100
mg PO BID for 10
days with caution

PDA:

Next

DEMONSTRATION

■ SAMPLE PATIENT 2:

- ALLERGIES? (Tetracycline)
- WEIGHT? (310 lbs)
- AGE? (30)
- GENDER? (Male)
- Pregnant or Breast Feeding? (No)
- Taking other Medications? (Probenicid)
- Kidney Problems? (Yes)

DEMONSTRATION

CLERKS first Question:

“Are you allergic to tetracycline?”

- | Reader's paper has | READER's response |
|---------------------------------------|-------------------|
| 1 of 4 responses | |
| Allergies? (No) | “No” |
| <u>Allergies? (Tetracycline)</u> | <u>“Yes”</u> |
| Allergies? (Quinalones) | “No” |
| Allergies? (Tetracycline, Quinalones) | “Yes” |
- **GENERAL RULE:** If unsure of what to say, just read what is on your paper.

DEMONSTRATION

1st Q: “Are you allergic to tetracycline?” “Yes”

2nd Q: “Are you allergic to quinalones?”

■ Reader’s paper has

1 of 4 responses

READER’s

response

Allergies? (No)

“No”

Allergies? (Tetracycline)

“No”

Allergies? (Quinalones)

“Yes”

Allergies? (Tetracycline, Quinalones)

“Yes”

DEMONSTRATION

1st Q: “Are you allergic to tetracycline?” “Yes”

2nd Q: “Are you allergic to quinalones?” “No”

3rd Q: “Are you taking probenicid?”

■ Paper has 1 of 4 responses

READER

Taking other medications?

(No)

“No”

(Probenicid)

“Yes”

(Theophylline)

“No”

(Probenicid, Theophylline)
**Stop
Probenicid
temporarily**

“Yes”

DEMONSTRATION

1st Q: “Are you allergic to tetracycline?” “Yes”

2nd Q: “Are you allergic to quinalones?” “No”

3rd Q: “Are you taking probenicid?” “Yes”

4th Q: “Are you taking theophylline?”

■ Paper has 1 of 4 responses

READER

Taking other medications?

(No)

“No”

(Probenicid)

“No”

(Theophylline)

“No”

(Probenicid, Theophylline)

“Yes”

DEMONSTRATION

1st Q: “Are you allergic to tetracycline?” “Yes”

2nd Q: “Are you allergic to quinalones?” “No”

3rd Q: “Are you taking probenacid?” “Yes”

4th Q: “Are you taking theophylline?” “No”

5th Q: “Any kidney problems?”

■ Paper has 1 of 2 responses

READER

Kidney problems?

(Yes)

(No)

“Yes”

“No”

DEMONSTRATION

- 1st Q: “Are you allergic to tetracycline?” “Yes”
2nd Q: “Are you allergic to quinalones?” “No”
3rd Q: “Are you taking probenecid?” “Yes”
4th Q: “Are you taking theophylline?” “No”
5th Q: “Any kidney problems?” “Yes”
6th Q: “Are you 73 lbs or less?” or
“How much do you weigh?”

■ Paper has 1 response

Weight? (310 lbs)

READER

“I weigh 310 lbs”

- **GENERAL RULE:** Let clerk do interpretation.
Give number for weight or age.

DEMONSTRATION

PDA:

Next

1st Q: “Are you allergic to tetracycline?”

“Yes”

2nd Q: “Are you allergic to quinalones?”

“No”

3rd Q: “Are you taking probenacid?”

“Yes”

4th Q: “Are you taking theophylline?”

“No”

5th Q: “Any kidney problems?”

“Yes”

6th Q: “Are you 73 lbs or less?”

“How much do you weigh?” “I weigh 310 lbs”

Ciprofloxacin 500mg QD and referral to physician for dose adjustment and monitoring

DEMONSTRATION

■ SAMPLE PATIENT 1:

- ALLERGIES? (No)
- WEIGHT? (155 lbs)
- AGE? (77)
- GENDER? (Male)
- Pregnant or Breast Feeding? (No)
- Taking other Medications? (No)
- Kidney Problems? (No)

DEMONSTRATION

■ SAMPLE PATIENT 2:

- ALLERGIES? (Tetracycline)
- WEIGHT? (310 lbs)
- AGE? (30)
- GENDER? (Male)
- Pregnant or Breast Feeding? (No)
- Taking other Medications? (Probenicid)
- Kidney Problems? (Yes)

STUDY MECHANICS

- 15 CLERKS and 15 READERS in PDA and PAPER groups
- Will evaluate 64 different identities for Paper, and 64 for PDA
- Will do in subgroups of 8 patient identities
- Will stop after 12 minutes if not completed for the 8 patients
- Do the best you can. Monitors can help only with technical, PDA type questions
- READERS will shift to another CLERK after each 8.
- Restroom break at the halfway point

Mass Medication Distribution for Disease Outbreak – Comparison of PDA-Assisted to Paper-Based Flow-Chart Processing

V. Garshnek¹, L. Burgess¹, R.D. Clyde², D. Birkmire-Peters¹, C. Aschwanden¹, D. Horne¹, B. Burgess¹, M. Meyer²

In a biological attack or infectious disease emergency medication needs to be rapidly yet safely distributed to a large population to minimize infection outbreak. We trained volunteers in the use of technology that included the use of Personal Digital Assistants (PDAs) to study whether an algorithm-driven PDA could improve efficiency and safety of medication distribution vs. a more traditional paper decision flow chart method. If equal or effective, other benefits could be gained from electronic storage of data including easy retrieval and logistics of medication dispensing. The research question of interest was: Are there significant quantifiable differences in efficiency (time) and error rates in drug dissemination to large groups of people in a disease outbreak scenario using a paper decision-tree method vs. PDA-assisted method? For this study 30 volunteers (mock citizens each reading a total of 128 identities to a clerk) were sent through points of dispensing (PODs), with 30 volunteer clerks processing these subjects. Data gathering consisted of two sessions during a mock disease outbreak. For the first session half the clerks processed citizens using the paper method and the other half processed citizens with the PDA. For the second session the clerks switched modes and processed citizens using the alternate method. Each volunteer clerk received the same training and saw the same subject identities (64 in each session). Time to process subjects was recorded with a stopwatch along with the prescription generated by the clerk for each identity. The correct antibiotic for each citizen identity was kept on a master answer sheet for later comparison. PDA answers were automatically uploaded to a database while paper version answers were recorded manually on identity-coded flowcharts. Data analysis indicated no significant difference in number of errors made with PDA vs. paper methods. In terms of efficiency (time) overall, no significant difference was found in paper vs. PDA methods. However, the mode and order of testing affected time -- clerks doing the paper method second were slower than those who did paper first ($P = 0.001$). The PDA method was consistent in time whether clerks used it first or second. A possible explanation may be the presence of a fatigue factor resulting from using the paper method. It is postulated that processing with the PDA requires less thinking than the paper method as one plugs in answers to questions whereas following a flowchart takes some additional thinking. This may have resulted in slower times as fatigue played a role in the second session. The findings may indicate that during a major disease outbreak, when clerks are tired yet still must continue processing citizens, use of an algorithm-driven PDA may be beneficial to improve efficiency.

Appendix 8: Literature Review

Utilizing Technology to Improve Mass Medication Distribution During a Disease Outbreak – A Review of the Literature and the Hawaii Example

A large scale natural disaster or an act of terrorism targeting the US population will require rapid access to and distribution of large quantities of pharmaceuticals (1). If a community does not receive and distribute the appropriate medications quickly, diseases could spread and lives may be lost (2, 3). The Strategic National Stockpile (SNS) was established in 1999 at the Centers for Disease Control and Prevention (CDC) to provide an inventory of medications and supplies to send to a location in the event of a large infectious disease outbreak or other public health emergency, including a bioterrorism (BT) attack. In light of previous information on bioterrorism, particularly Anthrax, it is now evident that communities of all sizes must work to provide prophylaxis for the total population in 48 hours (4). State and local planners must find new ways to increase the number of patients seen in shorter periods of time and also adhere to certain standards of medical care. A need clearly exists to enhance medication distribution efforts through more efficient processing and training (5,6,7). By utilizing technologies that are portable, can function anywhere, and are easy to use (enabling the rapid training of users), drug distribution efficiency and disease outbreak control may be improved (8).

In Hawaii, should a significant disease outbreak or BT event occur, a community-based public prophylaxis program will be conducted by the State of Hawaii, Department of Health (DOH), Bioterrorism & Preparedness Branch (9) through its Mass Medication Clinic (MMC) process (see Algorithm in the supplemental documents). Hawaii's DOH strategy for antibiotic prophylaxis includes consideration of broad-spectrum coverage with a single antibiotic choice (Doxycycline or Ciprofloxacin) based on individual patient characteristics. This strategy permits efficient and rapid dissemination of population-based prophylaxis without analysis of antibiotic choice based on a specific disease outbreak threat. Upon the identification of a public health emergency requiring medication distribution, DOH will establish a single Department Operations Center (DOC) and multiple Points of Dispensing (PODs) at community centers, libraries, gymnasiums, etc. The number and location of PODs will depend on the nature of the incident. Citizens processed at the PODs will be screened for symptoms, contraindications, interactions, allergies or interventions to ensure that appropriate medication (dosage and form) is provided. The Hawaii DOH plans to process as many as 5,000 citizens at each POD each day (two 8-hour shifts of 150 staff). Overdose is not the issue in the procedures outlined by the Hawaii DOH . The main issue is providing the correct medication to the correct type of individual. Doxycycline is the drug of choice for most of the population, but if one is allergic, pregnant or breast feeding, and 8 years of age or less, then one receives the quinolones. Although less frequently encountered, overdosage must still be managed by the algorithm. For doxycycline, overdosage does come into play for children between the ages of 9-11 and those individuals that weigh less than 99 pounds. For quinalones, certain medications must be stopped or reduced and dosages adjusted for patients less than 73 pounds. Both correct dispensing (correct medication to correct subject) and correct dosage must be taken into account when any health care entity dispenses medication.

Efficient POD operation is important to meet or exceed predetermined patient per hour throughput goals. Critical to the success of the SNS initiative is ensuring capacity is developed at federal, state, and local levels to receive and safely dispense SNS assets (10). An important

next step is to train volunteers in the use of technology (the Patient Medical Assistant (PMA) System) including use of Personal Digital Assistants (PDAs) to improve efficiency and safety of medication and to study the implications of utilizing technology to improve the efficiency of medication distribution using Hawaii as a test bed.

Since PODs can be staffed by non-medically trained volunteers, providing appropriate training and algorithm-based visual aids is critical to ensure that subjects are dispensed prophylactic medication appropriately. Inappropriate medication dispensing could result in unintended consequences. The challenge of automating a paper-based algorithm-driven system is to efficiently process the population with safety and efficient throughput as the first priorities. The ability to add smart computing to the PDA to automate algorithmic decisions will be more important as algorithms are more complex and stress on volunteers is worsened by overwhelmed PODs coupled with the severity of the incident.

The utilization of “spontaneous volunteers” (i.e. lay persons not previously trained to perform the job of interest) (11-13) is well documented and volunteers continue to be used in disasters when disaster staff are in short supply. For example, in the early stages of the Hurricane Katrina disaster, volunteers provided important logistics support to help meet the immediate needs (14). The CDC recognizes that the role of volunteers is a key element to the success of dispensing SNS medications and supplies. Essential elements of a successful volunteer program include recruitment, training, coordination and management, and volunteer maintenance. An actual emergency will likely include different types of volunteers – medical and non-medical; spontaneous and planned. The CDC offers training webcasts and information regarding mass antibiotic dispensing and management of volunteers through its Public Health Training Network website (15).

In the areas of medical prescription and medication distribution, it is well documented in the literature that the introduction of computerized systems (PC, laptop, PDA) to replace handwritten methods, significantly decreases the errors associated with these activities (16, 17-21). Large reductions have been seen in the major types of medication errors: dose errors, frequency errors, route errors, substitution errors, and allergies (17,18,22). The ease of use and efficiency, characteristics of the PDA, are valuable assets during mass-gathering events or emergencies, where processing as many people as possible as rapidly as possible is essential (23). However, these results were with providers who were familiar with the technology. There are concerns that with a wide range of volunteer clerks, and technical unfamiliarity with PDAs may limit the applicability of such a program.

Such limitations may be overcome with appropriate focused training. This was demonstrated in a project led by Massachusetts-based organization SATELLIFE, that tested and evaluated the use of PDAs in healthcare environments in Ghana, Uganda, and Kenya during December 2001-December 2002. PDAs were used by physicians, medical students and community volunteers in different settings to demonstrate their viability and usefulness, especially for health data collection and the dissemination of medical information. The project found that all participants required at least some basic training in order to use the handheld computer effectively. More focused training was needed to train people how to use the handheld computer for data collection. The project also found that training was not only necessary for the technology users,

but also for those who were managing the project (24). Evidence supporting the usefulness of PDAs for medical applications is encouraging, with PDAs demonstrating that they can improve educational experiences, reduce the time spent gathering data on patients, and perform other tasks helpful in managing medical events (25,26). However, the question remains as to how much better it is than PDAs for a naturally occurring or engineered biological event using volunteers. For this project, we will study the potential for technology (i.e., the PMA System) including the use of Personal Digital Assistants (PDAs) by POD and DOC staff/volunteers to improve the efficiency and effectiveness of the POD performance. Although DOH has anecdotally demonstrated improved efficiency with PDAs in preliminary tests, objective data is lacking for efficiency (time) effects and error rates in algorithm-driven medication prescribing comparing the paper method vs. the PDA-assisted method in an outbreak episode. A PDA system that is able to provide efficient processing, reduced error rates, and ease of use that allows for the rapid training of volunteers (as compared to a paper only system) would be an extremely valuable tool for use in mass casualty emergencies and for local health department mass prophylaxis program planning. Once the effect of PDAs is established with this first study, with additional funding future studies could look at how fatigue might influence outcomes over a longer mock event, which might provide further documentation as to the PDAs utility.

An algorithm-driven mass prophylaxis effort accomplished by any community using PDAs has not been found in the literature, however, a similar effort (utilizing laptop computers) has been tried in Kansas City, Missouri (27). Although general guidelines to conduct a mass prophylaxis event assume that paper forms are to be used (1), the Kansas City emergency-planning officials realized that paper forms are an inefficient process to store and track patient information. This group developed an automated program that was easy to use and deploy in an emergency situation with software that would quickly identify people at greatest risk for drug interactions or allergic reactions. The program automatically makes a medication recommendation based on the patient's symptoms and medical history. The software called MEDS/POD requires program users to be trained in a short amount of time (about 10 minutes). The program is a Windows-based application and contains a printable health assessment form for patients to complete which is the first step in the POD process (unlike our system, where we input the answers directly into the PDA – a paper form is not required in our case). The patient then gives the form to a clinic registrar who enters the data into the MEDS/POD (an additional step not required in our system). The MEDS/POD generates a summary report of patient information which the registrar prints and gives to the patient. The system, based on the inputted information, automatically determines which POD station the person should next be directed – to a counseling area or other health care professional or directly to the dispensing area. MEDS/POD was tested publicly in June 2004, during a Kansas City regional emergency-preparedness drill which simulated a pneumonic plague attack. The system worked well and enabled a more efficient process for record keeping and tracking patients. The software was also tested at a second emergency-preparedness drill in June 2005, in St. Louis. The system was tested again during an actual flu immunization clinic utilizing actual citizens. A survey was taken later asking the public whether the addition of the new program made a difference in wait time, efficiency, or any other aspects experienced at previous years' clinics. There was an overall positive response. However, actual quantitative data, statistical analysis, and hypothesis testing were not done. Although testing of this system was initiated in 2004, the actual "news story" did not appear in the media until 1 March, 2006.

In terms of PDA use in clinic and hospital settings where prescription management has been observed, the use of PDAs resulted in fewer prescribing errors, better record keeping (improved accuracy over the existing paper process), and reduced staff workload (and labor costs) (28). In hospital documentation, few objective data exist that quantify the effect of PDAs on documentation. In one study, the quality ratings of documentation improved significantly with PDA when studied in a randomized, controlled trial in a 36-bed orthopaedic ward (29). Although various learning curve effects were observed with different operators, the general conclusion was that handheld computers may improve the quality of hospital charts. Another study seeking to determine whether use of a PDA would improve emergency medicine house officer documentation (first-year Emergency Medicine residents) of procedures and patient resuscitations found more entries to be complete using the PDA (30). Mean documentation of three procedures significantly increased in the PDA vs. handwritten groups. Of the PDA entries, 100% were entered completely, compared to only 91% of the handwritten group, including 4% that were illegible. Ten of 11 questioned residents preferred the PDA procedure log to a handwritten log.

Electronic data collection utilizing PDAs has been recently studied. Lal and co-workers found that the total time for burn data collection on a handheld device and downloading to a personal computer was 23% faster than hand recording and generated 58% fewer errors (31). Also patient data management is simplified and overcomes some of the limitations of the paper format, such as the inability to automatically sort and analyze data (32).

Electronic data collection with a PDA in the field has been demonstrated in refugee camps along the Thai-Burma border (33). Palm handhelds were used running intuitive Pendragon electronic forms enabling workers to input answers rather than taking notes by hand and spending nights transcribing those notes into their laptops or PCs. They were able to link their Palm handhelds to a computer and download the information directly from the program or backup their data by beaming to another Palm handheld. This system was tested while conducting nutritional surveys in the refugee camps and decreased the total data entry process for the nutritional survey from several hours to approximately five minutes. This type of system was again used in Ghana and Zambia during an effort to distribute insecticide-treated bednets during a measles vaccination campaign (34). A population-based demographic survey was conducted in each country after the vaccination campaign. Volunteers used handheld computers (PDAs) to read and record the survey questions. Programming was done prior to shipment to the field. The assessment data were transferred from the PDAs to a laptop computer as an Access database. The PDAs were not used during the administrative processes of vaccination or bednet distribution.

In a true disaster situation, in which chaos would be a problem, guidelines exist for communities and states regarding support functions that should be in place during a mass prophylaxis effort, so that the distribution of medications can continue to serve the population. The US Department of Health and Human Services has published a planning guide for community-based mass prophylaxis that is available on the Web (1). In it, the support functions (or “logistics”) are listed and explained. These include such functions as patient traffic directors, translation services, facilities maintenance, security, etc. Under the description of Security, the planning guide states “security staff are needed to ensure the personal safety of staff. While the

past several years have seen increasing attention by the public health community to these security needs for mass prophylaxis campaigns, there is as yet no consensus on the number of individuals required to achieve these goals. One approximation derived from live exercises at several US sites with the Strategic National Stockpile training package is that for every four to five core staff there should be approximately one security staff.” When reviewing the mass prophylaxis plans of various cities, these guidelines are followed and exercises conducted with the support of the city police force to take care of security/chaos issues (35)). Therefore, in an actual emergency situation, “chaos” will be dealt with by this well-defined support function. The CDC also states the necessity of security support during mass prophylaxis (36)).
