Form Approved
OMB No. 0704-0188

Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

DIVISION IV / COMMISSION 26 / WORKING GROUP BINARY AND MULTIPLE SYSTEM NOMENCLATURE

**CO-CHAIRS
MEMBERS**

**Brian D. Mason, William I. Hartkopf
Dimitri Pourbaix, Colin D. Scarfe,
Marion Schmitz, Andrei A. Tokovinin**

TRIENNIAL REPORT 2006 - 2009

1. Introduction

The Working Group on *Binary and Multiple System Nomenclature* was formed within Commission 26 following Special Session 3 held during the 2003 Sydney General Assembly. Its purpose is to create the Washington Multiplicity Catalog, a comprehensive database first introduced at a multi-commission meeting at the IAU XXIV General Assembly in Manchester, 2000. Data are being compiled from the US Naval Observatory visual binary catalogs and supplemented with binary and multiple star information from other sources to include but not limited to spectroscopy, photometry, eclipsing and interacting system, as well as extra-solar planets and substellar companions. The goal being creation of a comprehensive hierarchical database and to reduce confusion from multiple nomenclature schemes used by disparate techniques.

2. Activities

Following the Manchester Multi-Commission Meeting, a sample slice of the sky was selected for implementation. This sample, of 30' width in Right Ascension and from pole-to-pole was completed for the Sydney Special Session. Of this portion of the sky, various techniques contribute to the sample WMC in the following percentages:

- 95.8% visual binaries and optical pairs
- 50.6% interferometric binaries and optical pairs
- 1.7% spectroscopic binaries
- 1.4% cataclysmic variables or related objects
- 1.0% occultation binaries
- 0.3% astrometric binaries
- 0.2% eclipsing binaries
- 0.2% X-ray binaries
- 0.1% spectrum binaries
- 0.1% planets

Since the techniques are complementary, the sum is >100%. It should be noted that this breakdown is biased significantly by selection effects. For example, while visual binaries may be discovered (and cataloged) after a single observation, data on spectroscopic pairs are often not published until the full orbit has been characterized.

To identify common objects, precise (0".1) coordinates were selected to form the sieve by which objects are brought into multiplicity arrangements. While the more modern

techniques often list precise coordinates as a matter of course, the older and much larger visual database does not. To date, work has focused on completing this. To date, the completion status is as follows:

Status of WDS coordinates

0.1 arcsec level	98990	95.34%
1 arcsec level	993	0.96%
10 arcsec level	1284	1.24%
worse than 10 arcsec	1804	1.74%
rejected (bogus)	753	0.73%

Supplementary information

two proper motions	42112	40.56%
one proper motion	43501	41.90%
no proper motion	18211	17.54%
no primary magnitude	54	0.05%
no secondary magnitude	2128	2.05%
no theta	228	0.22%
no rho	36	0.03%
no observation date	28	0.03%

3. Status update

A status update will be presented at the IAU XXVII General Assembly in the Commission 26 Business Meeting in Rio de Janeiro, Brazil, August 2009.

Brian D. Mason & William I. Hartkopf
co-chairs of the Working Group
