

NOTE

Notes on the Distribution of *Anopheles (Anopheles) sinensis* Wiedemann (Diptera: Culicidae) in China and the Status of Some *Anopheles Hyrcanus* Group Type Specimens from China

Anopheles (Anopheles) sinensis Wiedemann is an important vector of malarial parasites in China and Korea (Liu et al. 1990, Wilkerson et al. 2003). It has a wide distribution in Asia, including Afghanistan, Cambodia, China (north and south parts, Hong Kong), Malaysia, India (Assam), Indonesia, Japan (Hokkaido, Honshu, Shikoku, Kyushu, Tsushima, Ryukyu Islands), Korea (Korean Peninsula, Cheju Do), Myanmar, Singapore, Taiwan, Thailand, Vietnam (Tanaka et al. 1979, Harrison and Scanlon 1975), and Nepal (Darsie and Pradhan 1990). Several sources were used to document the distribution record of *An. sinensis* in China. First, LMR examined about 400 pinned mosquito specimens in the collection of the Institute of Zoology Museum, Chinese Academy of Sciences, Beijing. These specimens are presently housed in more than 50 boxes (most of which are 29 × 21 × 5.5 cm in size). Based on these collections, about 27 localities (counties or towns) in 8 provinces and 1 city (Beijing) were confirmed for *An. sinensis* (Table 1). Secondly, more than a hundred specimens located in the National Museum of Natural History, Smithsonian Institution, and on loan from The Natural History Museum, London, identified as *An. sinensis* were examined and confirmed from three provinces: Guangdong (Guangzhou: Daling), Yunnan (Kaiyuan, Kunming); Jiangsu (Nanjing, Wuxi). Thirdly, specimens of *An. sinensis* deposited in the Department of Etiologic Biology, Second Military Medical University, Shanghai, China, which includes collections from Hainan (Sanya and Lingshui), Guangdong (Zhuhai) and Shanghai, were confirmed. Fourth, the Entomology Laboratory of the Jiangsu Institute of Parasitology has on-going colo-

nies of *An. sinensis*, whose origin was Wuxi, Jiangsu. Lastly, Ma et al. (1998) conducted molecular analyses of Chinese mosquitoes and listed one city (Beijing) and 9 provinces (county or town in parenthesis) of China where they collected *An. sinensis*, namely, Fujian (Jianyang), Guizhou (Sinan), Hainan (Dengmai), Henan (Zhengzhou), Jiangsu (Wujing, Wuxi), Liaoning (Faku, Shenyang), Shandong (Jining), Shanxi (Danfeng), Sichuan (Pixian, Pujiang), and Yunnan (Simao). The above observations reflect a very extensive geographical distribution of *An. sinensis* in mainland China, and we report that it is now known to occur in 46 locations (counties or towns) of 16 provinces and 2 cities (Beijing and Shanghai) (Fig. 1).

According to Yang et al. (1991: 84), the holotypes, allotypes, and paratypes of the *Anopheles (Anopheles) changfus* Ma (1981: 65), *An. (Ano.) dazhaius* Ma (1981: 65–66), *An. (Ano.) heiheensis* Ma (1981: 66–67) and *An. (Ano.) xiaokuanus* Ma (1981: 67–68) are deposited in the Institute of Zoology Museum, Chinese Academy of Science. The type localities are Sichuan (Emai) and Sichuan (unknown town) of the first two species, respectively, and Heilongjiang (Aihui) for the last two species. During a visit (LMR) to the Institute of Zoology Museum in May 2004, the insect curators, Dr. Xiaolin Chen and Mr. Jian Yao, attempted to find the above types in the museum building but could not locate them. Dr. S. F. Ma, who described those four species, was also unable to give any additional information about the location of the specimens (Xiaolin Chen, personal communication). If these specimens prove to be non-extant, neotype designations will be necessary to ensure stability in the *Anopheles Hyrcanus* Group.

Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

We are especially grateful to the following staff of the Institute of Zoology Museum, Chinese Academy of Sciences, Beijing, China: Ai-Ping Liang for his help and hospitable arrangement of the museum visit; Xiao-Lin Chen, Yao Jian, and H. Liu for their help in curating the specimens and

translating data labels of the specimens; and Ge-Xia Qiao for initially arranging the museum visit. Thanks to Ralph Harbach (Department of Entomology, The Natural History Museum, London, U.K.) for the loan of *An. sinensis* specimens, and James W. Jones and Jetsumon Prachumsri (Depart-

Fig. 1. Map of mainland China showing distribution of *Anopheles sinensis* (based on observed and published specimens).

ment of Entomology, Armed Forces Research Institute of Medical Sciences, U.S. Army) for their support. Thanks also to Tom D. Anderson for preparing the map, and Richard C. Wilkerson and Yiau-Min Huang for reviewing the manuscript. This work was performed under a Memorandum of Understanding between the Walter Reed Army Institute of Research and the Smithsonian Institution, with institutional support provided by both organizations. The opinions and assertions contained herein are those of the authors and are not to be construed as official or reflecting the views of the Department of the Army or the Department of Defense.
