

REPORT DOCUMENTATION PAGE				Form Approved OMB No. 0704-0188	
The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

LONG-TERM GOALS

This research aims to develop the coastal management and research capabilities of Gulf of Guinea nations to increase the ability to predict and mitigate coastal hazards. The anticipated means to do so is through sponsoring and developing the coastal processes research capabilities of these nations and their university systems. Initial activities are focusing on the research group within the Department of Oceanography and Fisheries of the University of Ghana (UG), with a goal of not only increasing the capabilities of Ghana to monitor and manage their coast, but to develop UG as a center of research excellence for the Gulf of Guinea region.

OBJECTIVES

The objectives of these research activities are to provide guidance to the nascent coastal processes research program at the Department of Oceanography and Fisheries, University of Ghana, Accra, Ghana. Development of this program is anticipated to aid maritime governance capabilities and social stability within Ghana. Over the short term, the goal is to develop the capabilities UG to assess the local coastal hazards and their causes and to monitor ongoing monitoring of coastal change. Development of these technological capabilities (coastal processes expertise, terrestrial surveying, bathymetric surveying, wave computation, coastal change modeling, GIS skills) is intended to lead to a self-sustaining research group at the University of Ghana that can then independently pursue other research questions and seek other party funding, either locally or internationally. The PI is serving in an advisory role; however, another objective for these future activities is the development of independently funded international-quality collaborative research between the PI and the coastal researchers at UG.

APPROACH

This project consists of technical advising and the development of collaborations between the PI and UG scientists. The primary means of interaction was a week-long workshop at

the University of Ghana in February 2009 which included scientific presentations, field visits, collection of preliminary field data, and small-group discussions. Interactions between UG and WHOI continued into the summer when a UG faculty member visited WHOI for a month.

WORK COMPLETED

A workshop on Coastal Processes was held from February 23-27 at the Department of Oceanography and Fisheries, University of Ghana (UG), Accra, Ghana, conducted by ONR-funded researchers experts Cheryl Hapke of the U.S. Geological Survey (USGS) and Andrew Ashton of the Woods Hole Oceanographic Institution (WHOI), in conjunction with hosts George Wiafe and Selorm Ababio of UG. This meeting included representatives of several UG departments, government agencies/regulators, faculty from other Ghanaian universities/institutions. This workshop follows a previous meeting held in April of 2008 at UG that included Tom Lippman, currently at the University of New Hampshire (UNH), and Dano Roelvink, of the United Nations Educational, Scientific, and Cultural Organization Institute for Water Education (UNESCO-IHE).

The workshop included presentations, field reconnaissance, preliminary collection of field data, and informal discussions amongst the participants. These included:

- presentation of theoretical aspects of coastal evolution by the PI, including recent research findings regarding plan-view coastal evolution that should be applicable to understanding chronic erosion hazards along the Volta Delta and research involving the response of coasts to accelerated sea-level rise, a phenomenon which will exacerbate the existing hazards along the Ghanaian coast over the future decades and centuries.
- presentation of techniques to understand long-term coastal evolution through aerial photography and historic maps (led by Cheryl Hapke).
- visiting coastal locations of varying geomorphic type to assess coastal hazards and processes, particularly to understand the influence of geologic setting and history on active processes and current change.
- performing initial field deployments of UG's recently acquired Real-Time Kinematic Global Positioning System (RTK-GPS) equipment and reconnaissance mapping using WHOI's geophysical equipment (Ground-Penetrating Radar, GPR).

Future collaborations were planned to apply an existing model of shoreline evolution (Ashton and Murray, 2006) to the Volta Delta coast. Also, the preliminary field deployment of the GPR was post-processed, demonstrating that high-quality subsurface data can be collected along the Ghanaian coast. Postprocessing was demonstrated at the workshop by the PI. The PI also hosted Selorm Ababio of UG at WHOI during the summer of 2009; the visit included interactions with a number of scientists throughout the community and participation in field activities, including offshore vibracoring and CHIRP deployment.

RESULTS

The successful workshop led to the development of future collaborations and studies of the Ghanaian coast. Ashton and Hapke communicated that the location of many of the reported chronic erosion problems along the Ghanaian coast can generally be understood using geological and anthropogenic perspectives—there seem to be few ‘surprising’ coastal erosion hazards. Accordingly, short-term coastal research goals were delineated, including surveying the current Ghanaian coast, compilation of historical shorelines, computation of regional sediment budgets, and measurement of wave forcing.

The workshop led to an abstract that was presented at International Geoscience and Remote Sensing Symposium held in Cape Town, South Africa in the summer of 2009, and an abstract for the entire Ghanaian coastal research initiative was submitted by the group (led by George Wiafe). Selorm Ababio of UG also visited Woods Hole, MA, to interact with researchers at WHOI, the USGS Woods Hole Field Center, and UNH; this visit was hosted by the PI and used funding from WHOI’s Mary Sears Visitor Program. Plans have been developed for future study of the processes affecting coastal evolution of the Volta Delta, including further geophysical surveys and application of a large-scale numerical model of coastal evolution.

IMPACT/APPLICATIONS

This project addresses the overarching goal of improving maritime security in the Gulf of Guinea, and specifically in Ghana. A short-term impact will be assessment of coastal hazards along the Ghana coast and development of a research plan to increase coastal safety through hazard identification and mitigation. This hopefully will lead to the development of scientific relationships between the PI and African coastal researchers. Over the long term, the objective is to develop the independent research capabilities of the University of Ghana to improve the national capabilities in coastal hazards management and eventually maritime and fisheries management.
