

Climate-Change Science and Policy: What Do We Know? What Should We Do

John P. Holdren

Assistant to the President for Science and Technology
and Director, Office of Science and Technology Policy
Executive Office of the President of the United States

**Kavli Prize Symposium
International Cooperation in Science
Oslo • 6 September 2010**

Coverage of these remarks

WHAT DO WE KNOW?

- The essence of the challenge
- Five myths & their refutations
- Climate change risks & impacts going forward

WHAT SHOULD WE DO?

- The available options
- How much mitigation, how soon?
- A mitigation supply curve & its implications
- The Obama Administration's strategy

Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

The essence of the challenge

- Without energy there is no economy
- Without climate there is no environment
- Without economy and environment there is no material well-being, no civil society, no personal or national security

The problem is that the world is getting most of the energy its economies need in ways that are wrecking the climate its environment needs.

Five myths about the challenge

1. A little global warming can't hurt anything.
2. The Earth is no longer warming anyway.
3. Even if it is, humans aren't the main cause.
4. If there is any danger, it's far in the future.
5. The CRU e-mails and IPCC mistakes have shown that mainstream climate science is deeply flawed.

“Global warming” is a (dangerous) misnomer

That term implies something...

- uniform across the planet,
- mainly about temperature,
- gradual,
- quite possibly benign.

What’s actually happening is...

- highly nonuniform,
- not just about temperature,
- rapid compared to capacities for adjustment
- harmful for most places and times

We should call it “global climate disruption”.

Why average temperature isn’t the whole story

Climate = weather patterns, meaning averages, extremes, timing, spatial distribution of...

- hot & cold
- cloudy & clear
- humid & dry
- drizzles & downpours
- snowfall, snowpack, & snowmelt
- breezes, blizzards, tornadoes, & typhoons

Climate change means disruption of the patterns.

Global average temperature is just an index of the state of the global climate as expressed in these patterns. Small changes in the index → big changes in the patterns.

Can't hurt anything?

Climate governs (so climate disruption affects)

- availability of water
- productivity of farms, forests, & fisheries
- prevalence of oppressive heat & humidity
- formation & dispersion of air pollutants
- geography of disease
- damages from storms, floods, droughts, wildfires
- property losses from sea-level rise
- expenditures on engineered environments
- distribution & abundance of species

The Earth is getting hotter

Global Land–Ocean Temperature Index

The Earth is getting hotter (continued)

NOAA, State of the Climate 2009, 2010

The heating is not uniform geographically

Surface T in 2001-2005 vs 1951-80, averaging 0.53°C increase

J. Hansen et al., *PNAS* 103: 14288-293 (2006)

Other climate indicators are changing apace

This too is not uniform; most places getting wetter, some drier.

Other indicators: ocean heat content is growing

Other indicators: coastal glaciers retreating

Muir Glacier, Alaska

August 1941

August 2004

NSIDC/WDC for Glaciology, Boulder, compiler. 2002, updated 2006. *Online glacier photograph database*. Boulder, CO: National Snow and Ice Data Center.

Indicators: mountain glaciers shrinking

Rongbuk glacier in 1968 (top) and 2007. The largest glacier on Mount Everest's northern slopes feeds Rongbuk River.

National Snow & Ice Data Center 2010

Indicators: Arctic sea ice shrinking & thinning

Indicators: Greenland & Antarctic ice losing mass

Mass balance of the Greenland Ice Sheet
Gigatonnes per year

Mass balance of the West Antarctic Ice Sheet
Gigatonnes per year

The Copenhagen Diagnosis, 2009

Indicators: sea level rising

What's known about the causes?

Human vs natural influences 1750-2005 (watts/m²)

Human emissions leading to increases in...

atmospheric carbon dioxide	+ 1.7
methane, nitrous oxide, CFCs	+ 1.0
net ozone (troposphere↑, stratosphere↓)	+ 0.3
absorptive particles (soot)	+ 0.3
reflective particles (sulfates, etc.)	- 0.7
indirect (cloud forming) effect of particles	- 0.7

Human land-use change increasing reflectivity - 0.2

Natural changes in sunlight reaching Earth + 0.1

The warming influence of anthropogenic GHG and absorbing particles is ~30x the warming influence of the estimated change in input from the Sun.

IPCC AR4, WG1 SPM, 2007

The key greenhouse-gas increases were caused by human activities.

Compared to natural changes over the past 10,000 years, the spike in concentrations of CO_2 & CH_4 in the past 250 years is extraordinary.

We know humans are responsible for the CO_2 spike because fossil CO_2 lacks carbon-14, and the drop in atmospheric C-14 from the fossil- CO_2 additions is measurable.

IPCC AR4, WG1 SPM, 2007

Human influence: the “fingerprint”

Top panel shows best estimates of human & natural forcings 1880-2005.

Bottom panel shows that state-of-the-art climate model, when fed these forcings, reproduces almost perfectly the last 125 years of observed temperatures.

Source: Hansen et al.,
Science 308, 1431, 2005.

Fingerprint: models match observed ΔT on all continents

Are we seeing harm? Floods & droughts

30-year weakening of East-Asia monsoon – attributed to global climate change -- has meant less moisture flow South to North over China, producing increased flooding in South, drought in North, with serious impacts on agriculture.

Qi Ye, Tsinghua University, May 2006

Are we seeing harm? Wildfires

Wildfires in the Western USA have increased 6-fold in the last 30 years. Similar trends are evident in other fire-prone regions.

Are we seeing harm? Pest outbreaks

Pine bark beetles, with a longer breeding season courtesy of warming, devastate trees weakened by heat & drought in Colorado

USGCRP 2009

Are we seeing harm? Melting permafrost

Norwegian Polar Institute, 2009

Are we seeing harm? Coastal erosion

Shishmaref, Alaska; © Gary Braasch

Current harm is widespread

Worldwide we're seeing, variously, increases in

- floods
- wildfires
- droughts
- heat waves
- pest outbreaks
- coral bleaching events
- power of typhoons & hurricanes
- geographic range of tropical pathogens

All plausibly linked to climate change by theory, models, observed "fingerprints"

Bigger impacts expected going forward

What's expected: Hotter summers

What's expected: Worse heat waves

Extreme heat waves in Europe, already 2X more frequent because of global heating, will be "normal" in mid-range scenario by 2050

What's expected: worse wildfires

Percentage increases in median annual area burned for a 1°C increase in global average temperature

National Academies,
Stabilization Targets,
2010

What's expected: worse droughts

Drought projections for IPCC's A1B scenario

Percentage change in average duration of longest dry period, 30-year average for 2071-2100 compared to that for 1961-1990.

What's expected: declining crop yields

National Academies, Stabilization Targets, 2010

What 's expected: falling ocean pH

About 1/3 of CO₂ added to atmosphere is quickly taken up by the surface layer of the oceans (top 80 meters).

This lowers pH as dissolution of CO₂ forms weak carbonic acid (H₂O + CO₂ → H₂CO₃).

Increased acidity lowers the availability of CaCO₃ to organisms that use it for forming their shells & skeletons, including corals.

Steffen et al., 2004

What's expected: sea-level rise to 2100

The National Academies, America's Climate Choices, 2010, vol 1

Do recent disclosures about e-mails and IPCC missteps cast doubt on these conclusions?

- E-mails show climate scientists are human, too; more efforts at openness & transparency are warranted
- IPCC missteps show need for increased rigor in adhering to organization's strict review procedures; but errors discovered so far are few & unimportant.
- IPCC isn't the source of scientific understanding of climate, just one of the messengers. Sources are the global community of climate scientists & mountain of peer-reviewed research they've produced over decades.

Recent disclosures (continued)

- Nothing in e-mails or IPCC controversies rises to a level that would call into question the core understandings about global climate disruption.
- All science is contingent; there are always uncertainties & needs for refinement. And there's always a chance that new observations & analyses will not just refine but overturn previous conclusions.
- But such overturnings are extremely unlikely when the body of data & analysis supporting the generally accepted conclusions is extensive & much reviewed.

Recent disclosures (continued)

- Body of data & analysis supporting generally accepted conclusions about climate disruption is immense.
- Because of their relevance to policy choices of great importance, key findings from climate science have been subjected to unprecedentedly extensive peer review.
- It's therefore highly unlikely that new data or insights will alter these findings in a fundamental way.
- Policy makers should not bet the public's welfare against such long odds – i.e., bet that the science is wrong.

What should we do?

There are only three options:

- Mitigation, meaning measures to reduce the pace & magnitude of the changes in global climate being caused by human activities.
- Adaptation, meaning measures to reduce the adverse impacts on human well-being resulting from the changes in climate that do occur.
- Suffering the adverse impacts that are not avoided by either mitigation or adaptation.

Concerning the three options...

- We're already doing some of each.
- What's up for grabs is the future mix.
- Minimizing the amount of suffering in that mix can only be achieved by doing a lot of mitigation and a lot of adaptation.
 - Mitigation alone won't work because climate change is already occurring & can't be stopped quickly.
 - Adaptation alone won't work because adaptation gets costlier & less effective as climate change grows.
 - We need enough mitigation to avoid the unmanageable, enough adaptation to manage the unavoidable.

Mitigation possibilities include...

(CERTAINLY)

- Reduce emissions of greenhouse gases & soot from the energy sector
- Reduce deforestation; increase reforestation & afforestation
- Modify agricultural practices to reduce emissions of greenhouse gases & build up soil carbon

(CONCEIVABLY)

- “Scrub” greenhouse gases from the atmosphere technologically
- “Geo-engineering” to create cooling effects offsetting greenhouse heating

Adaptation possibilities include...

- Changing cropping patterns
- Developing heat-, drought-, and salt-resistant crop varieties
- Strengthening public-health & environmental-engineering defenses against tropical diseases
- Building new water projects for flood control & drought management
- Building dikes and storm-surge barriers against sea-level rise
- Avoiding further development on flood plains & near sea level

Many are “win-win”: They’d make sense in any case.

How much, how soon?

- Limiting ΔT_{avg} to $\leq 2^{\circ}\text{C}$ is now considered by many the most prudent target that's still attainable.
 - EU embraced this target in 2002, G-8 & G-20 in 2009
- Just to have a 50% chance of staying below 2°C
 - developed-country emissions must peak no later than 2015 and decline rapidly thereafter
 - developing-country emissions must peak no later than 2025 and decline rapidly thereafter.

Key mitigation realities

- Human CO_2 emissions are the biggest piece of the problem (50% and growing)
 - About 85% comes from burning coal, oil, & natural gas (which provide $>80\%$ of world energy)
 - Most of the rest comes from deforestation & burning in the tropics
- Industrialized & developing countries are now about equal in total CO_2 emissions.
- Global energy system can't be changed quickly: $\sim \$15\text{T}$ is invested in it; normal turnover is ~ 40 yrs.
- Deforestation also isn't easy to change: forces driving it are deeply embedded in the economics of food, fuel, timber, trade, & development.

Mitigation supply curve for 2030: aiming for 450 ppm CO₂e

Global GHG abatement cost curve

Abatement costs versus 'business as usual', 2030
\$ per tonne of CO₂e

Note: The curve presents an estimate of the maximum potential of all technical GHG abatement measures below \$90 per tCO₂e if each lever was pursued aggressively. It is not a forecast of what role different abatement measures and technologies will play.
Source: McKinsey Global GHG Abatement Cost Curve v2.0

Policy needs for the 450 ppm CO₂e supply curve

Global GHG abatement cost curve

Abatement costs versus 'business as usual', 2030
\$ per tonne of CO₂e

Note: The curve presents an estimate of the maximum potential of all technical GHG abatement measures below \$90 per tCO₂e if each lever was pursued aggressively. It is not a forecast of what role different abatement measures and technologies will play.
Source: McKinsey Global GHG Abatement Cost Curve v2.0

Is the needed mitigation affordable?

- Rough calculations
 - Paying an average of \$100/tC to avoid half of current world CO₂ emissions would cost \$0.5 trillion/yr, under 1% of current GWP (much of it a transfer, not a “loss”).
 - Using McKinsey cost curve for what we’d need to be doing in 2030 to be on 450 ppmv stabilization trajectory shows net cost of only about \$0.1 trillion/yr.
- Current econ models say mitigation to stabilize at 450 ppmv CO₂e probably means 2-3% GWP loss in 2030, 2100 (range 1-5%).
- World now spends 2.5% of GWP on defense; USA spends 5% on defense, 2% on env protection

The Obama administration’s strategy

- Promote recognition that problem is real and early action is preferable to waiting
 - The longer we wait, the bigger the damage from climate change & the more rapid the emissions reductions needed to stabilize.
 - Prudent action will be cheaper than inaction or delay.
 - We can reduce costly and risky oil imports and dangerous air pollution with the same measures we employ to reduce climate-disrupting emissions.
 - The needed surge of innovation in clean-energy technologies and energy efficiency will create new businesses & new jobs and help drive economic recovery& growth, maintain global competitiveness.

Obama administration strategy (continued)

- Put climate-change leaders in key positions
- Make climate change a priority for initiatives in departments & agencies
- Revitalize USGCRP & other interagency efforts
- Work with Congress to get comprehensive energy-climate legislation that will put the USA on the needed emissions trajectory with minimum economic & social cost & maximum co-benefits.
- Work with other major emitting countries – industrialized & developing – to build technology cooperation and individual & joint climate policies consistent with “avoiding the unmanageable”.

Some key climate-related appointments

- DOE: Secretary Chu
- Interior: Secretary Salazar
- NOAA: Administrator Lubchenco
- EPA: Administrator Jackson
- USGS: Director McNutt
- USAID: Administrator Shah
- CEQ: Chair Sutley
- OECC: Director Browner
- OSTP: Director Holdren
- PCAST: Drs Bierbaum, Molina, Moniz, Schrag

Guidance to agencies

- Executive Order on Federal Leadership in Environmental, Energy, & Economic Performance (10-09)
 - “to establish an integrated strategy towards sustainability in the Federal Government and to make reduction of greenhouse gas emissions a priority...”
 - designation of agency senior sustainability officers
 - sustainable buildings & acquisition policies
 - targets for GHG reductions in Federal agencies (28% reduction by 2020)

Guidance to agencies (continued)

EXECUTIVE OFFICE OF THE PRESIDENT
OFFICE OF MANAGEMENT AND BUDGET
WASHINGTON, D.C. 20503

July 21, 2010

THE DIRECTOR

M-10-30

MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

FROM: Peter R. Orszag 
Director, Office of Management and Budget

John P. Holdren 
Director, Office of Science Technology Policy

SUBJECT: Science and Technology Priorities for the FY 2012 Budget

Some priorities:

Understanding, adapting to, and mitigating the impacts of global climate change

- Support...an integrated National Climate Assessment of climate change science, impacts, vulnerabilities, & response strategies, including mitigation & adaptation.

Managing the competing demands on land, fresh water, & the oceans for the production of food, fiber, biofuels & ecosystem services based on sustainability & biodiversity

- Support research on integrated ecosystem management approaches

Agency initiatives

- DOE/DOT: \$80 billion for clean & efficient energy in ARRA
- DOE: creation of ARPA-E (\$400M in 2009-10, \$300M proposed for 2011), energy-innovation hubs
- EPA/DOT: first-ever fuel-economy/CO₂ tailpipe standards
- NOAA: restructuring to consolidate “climate services” germane to climate-change adaptation
- NASA/NOAA/DoD: FY11 budget restructures NPOESS for success, funds Orbiting Carbon Observatory replacement.

Agency initiatives (continued)

- DOI: restructuring to develop Climate Change Response Centers and Landscape Conservation Cooperatives, Carbon Storage Project
- EPA: “endangerment finding” that CO₂ imperils health & welfare, allowing regulation as a pollutant
- DOT-HUD-EPA: Partnership for Sustainable Communities

Revitalizing broad interagency efforts

- The “Green Cabinet”
 - Secretaries of Energy, Interior, Agriculture, Transportation, HUD, Labor; EPA Administrator; SBA Administrator; CEQ Chair; OSTP Director; chaired by OECC Director Browner
- National Science & Technology Council (NSTC)
 - Committee on Environment and Natural Resources (CENR) – chaired by Abbott, Lubchenco, Anastas – being repurposed as Committee on Environment, Natural Resources, and Sustainability.
- Climate-Change Adaptation Task Force
 - Co-chaired by OSTP, CEQ, NOAA, with senior representation from all relevant agencies
- The US Global Change Research Program

The US Global Change Research Program

- Created by the Global Change Research Act
- Purpose *“coordination of a comprehensive and integrated United States research program which will assist the Nation and the world to **understand, assess, predict, and respond** to human-induced and natural processes of global change.”*
- Response includes both mitigation and adaptation
- 13 participating Federal departments & agencies
- Administered by the USGCRP subcommittee of the Committee on Environment & Natural Resources of the National Science and Technology Council

USGCRP: strengthening the science core

- **Regional Climate Prediction** – downscaling GCMs to understand how local conditions will change
- **Precipitation** – reducing model uncertainty, particularly regarding the formation and dynamics of clouds
- **Ice** – increasing knowledge of basal processes and ice shelf dynamics
- **Aerosols** – understanding how sulfates, black carbon, sea salt and dust affect temperature and rainfall
- **Paleoclimate** – resolving questions about proxy data and improving temperature reconstructions, especially prior to 1500

USGCRP: New emphases

- **Adaptation Research**
 - Integrating human dimensions -- economics, management, governance, behavior, and equity
 - Interdisciplinary research that takes into account the interconnectedness of the Earth system
- **Integrated Assessments**
 - Engaging localities and sectors to aggregate information into a national picture of climate impacts
 - Gathering information on the “demand-side” of the adaptation problem, where people live and work, to reorient research and observation investments
 - Providing information and capabilities needed by those experiencing impacts

USGCRP: New emphases (continued)

- Climate Services
 - o Providing analysis and assessment that is ongoing, science-based, user-responsive, and relevant to all levels of interest, e.g., local, regional, national and international
 - o Communicating climate change information to users
- Plus – coordination among Science, Adaptation, & Mitigation

USGCRP: budget rising

AAAS 2010

New studies & assessments

- The National Assessment of Climate Change
 - Sits under the USGCRP and shares its new emphases;
 - Leadership: Kathy Jacobs, Director (OSTP), Tom Karl (NOAA), Tim Killeen (NSF)
- Continuing interagency / science community focus on climate-change adaptation
 - OSTP/CEQ/NOAA Task Force
 - National Adaptation Summit (May 2010) launched community-wide effort to develop a National Adaptation strategy with science goals, data strategy, metrics, interaction with state & local planners, publics

International engagement

- Personal engagement of President Obama to salvage a respectable outcome from Copenhagen COP-15
- Climate-change a priority in revitalized ministerial-level Commissions on Science & Technology Cooperation (with Brazil, China, India, Japan, Korea, Russia), and in US-Russia Bilateral Presidential Commission
- DOE ramping up bilateral cooperation on clean-energy technology with China and other international partners

National climate-change legislation

- President Obama was emphatic that new US energy legislation should include climate, above all a price on carbon emissions.
- The climate component was reluctantly & temporarily abandoned because of insufficient support in the US Senate.
- We will try anew in the next Congress; in the meantime, EPA is moving ahead to control greenhouse gas emissions by regulation.

Americans still support taking action (Jan 2010 poll)

The National Academies, America's Climate Choices, 2010, vol 4
