Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.					
1. REPORT DATE AUG 2012		2. REPORT TYPE		3. DATES COVERED 00-00-2012 to 00-00-2012	
4. TITLE AND SUBTITLE Multi-Functional Materials for Defense DoD Perspective on Sensing				5a. CONTRACT NUMBER	
				5b. GRANT NUMBER	
				5c. PROGRAM ELEMENT NUMBER	
6. AUTHOR(S)				5d. PROJECT NUMBER	
				5e. TASK NUMBER	
				5f. WORK UNIT NUMBER	
7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES) U.S. Army Research Laboratory,Sensors and Electron Devices Directorate,2800 Powder Mill Road,Adelphi,MD,20783-1197				8. PERFORMING ORGANIZATION REPORT NUMBER	
9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES)				10. SPONSOR/MONITOR'S ACRONYM(S)	
				11. SPONSOR/MONITOR'S REPORT NUMBER(S)	
12. DISTRIBUTION/AVAILABILITY STATEMENT Approved for public release; distribution unlimited					
13. SUPPLEMENTARY NOTES Presented at the 2nd ?Multifunctional Materials for Defense? Workshop in conjunction with the 2012 Annual Grantees?/Contractors? Meeting for AFOSR Program on ?Mechanics of Multifunctional Materials & Microsystems? Held 30 July ? 3 August 2012 in Arlington, VA. Sponsored by AFRL, AFOSR, ARO, NRL, ONR, and ARL.

Issues in the Background

- Data to Decision vs. Big Data
- Mission Scope
- Budget

What Does This Mean for Sensing Research?

- We Need to Rethink How We Do Sensors

What Do We Need?

1. Intelligent Hardware

- A System that Facilitates Decisions
- Adapts Dynamically

2. Application Specific Hardware

3. Multi-Functional Materials for Defence

- Not multiple applications per se
- Multiple functions per material
- Enable Intelligent Hardware

Goals for Today:

1. Collaboration
2. Innovate
3. Motivate

- Alma Wickenden (ARL)
- Joe Conroy (ARL)
- Vishnu Ganesan (Case Western)
- Kesshi Jordan (UC-Berkeley/San Francisco)
- Alec Koppel (U Pennsylvania)
- Yuan Chen (Princeton)
- Nick Perkons (Harvard)
- Daniel Silversmith, Kathryn Schneider (U Maryland)
- Michael Roberts (U Maryland BC)
- Michael Comparetto ()

- Cyber Physical Sensing and Control
 - Robotics
 - Human Physiological Monitoring
 - Piezo-MEMs
 - CMOS MEMs
- Collaboration Opportunities

Bio-Plausible Control Model

Cyber Physical Sensing & Control

Long Term Research Goals:

Implement sensor integration logic modeled after efficient biological systems for revolutionary, optimized coordination of varied physical and computational elements in fidelity-constrained, extremely low power sensor systems.

Program Objectives:

- Develop & implement bio-plausible control theory for power efficient, reflexive mm-scale robot control & sensor array information management
- Design, fabricate & test bio-/neuro-inspired MEMS/NEMS sensor modalities with minimized processor requirements
- Determine multisensory perception models suitable for decision making for autonomous small scale system operation & human/machine interfaces

Flexible Electronic Sensor Arrays

Rob Wood, Harvard/MAST

High Density Multifunctional Neuroimaging Sensor Arrays

Chan et al., Science, 1998

Multi-sensory perception

“Slow-computing” algorithms, Richard Murray, Caltech/ICB

ARL Piezo Wings (fruitfly-scale)

FY09-10 DRI

FY11 DRI

Power efficient, reflexive multi-sensory processing will increase the adaptability, autonomy, functionality, reliability, and efficiency of various Army-relevant power- and size-constrained systems.

mm-Scale Robotics

Autonomous System Technologies provide the Soldier with superior situational awareness in mounted and dismounted operations

UNCLASSIFIED

Severely Size, Weight, Power and Processing Constrained:

- Comprehensive Reexamination of Systems
- System Integration
- Novel Sensors
- Power Conversion
- Mobility Constraints
- Physics at the Small Scales

Micro-Autonomous System Technologies breeding a new class of Soldier assets

mm-Scale Robotics

Requires a Paradigm Shift to Integrated Microelectronics

Autonomous System Technologies provide the Soldier with superior situational awareness in mounted and dismounted operations

Cyber Physical Sensing & Control

Potential advantages:
Parallel, asynchronous processing, simplified logic applied where appropriate

Caltech Parallel, Asynchronous “Slow Computing” Logic

Known limitations:
Large, high power, limited sensor input formats, data exchange limits (time, bandwidth)

Sensors

Actuation

Traditional – requires fast, high power processors

Slow computing – parallel processing with low power, slower processors for fast control

Richard Murray

Band of Attitude Stabilization in Geodesic Degrees

Flight Vehicle

Test Arena

Feature Extraction

Wearable EEG Development and Testing (WDT)

STATUS quo

The current neuroimaging modalities do not allow assessment of brain activities of participants performing tasks involving natural movements

Severely limits neuroergonomic studies and applications in real-world environments

NEW INSIGHTS

EEG might allow freedom of movement of the head and body, but requires advanced on-line signal-processing algorithms to correct movement artifacts

Barrier Addressed:

To solve the lack of portable, user-acceptable, and robust systems for routinely monitoring brain and body dynamics in complex real-world environments (B1, B2)

ACHIEVEMENT DESCRIPTION

2010 MAIN RESULT:

- Dry foam-based electrode
- Spring-loaded probe electrodes
- Wireless data acquisition (DAQ) circuit board
- EEG cap (MINDO 16 helmet) featuring 16 dry electrodes, miniature DAQ, and wireless telemetry
- Graphic user interface on mobile devices for data logging

continue to improve the DAQ board

- Continue to improve the wearable and wireless dry-electrode (WWD) EEG system
- Modify the MINDO 16 for the HD-Cog TX17 experiment at ARL
- Evaluate the quality of signals acquired by the WWD EEG system
- Test feasibility of using the WWD EEG system to assess cognitive-state of operators in MVS
- Develop signal-processing approaches for on-line artifact removal

END-OF-PHASE GOAL

A wireless, wear-and-forget human machine interface that can allow assessment of brain activities of unconstrained participants within real operational environments

Transition:

MoBI for detecting changes in vehicle operator alertness and performance (TE 1). Advanced tools for MoBI and neurocognitive performance assessment (TE 2 C4)

COMMUNITY CHALLENGE

Can we augment human performance through the WWD EEG monitoring and processing?

WWD EEG systems are easily donned and doffed for cognitive monitoring in real-world environments

- **CHALLENGE:** The low signal-to-noise ratio and inconsistencies due to inter- and intra-personal variation of electroencephalography (EEG) data prohibits system use outside of a controlled laboratory environment.
- **GOAL:** Develop a filter that allows real-time, frequency-specific analysis of EEG data for the practical study of soldier cognitive function on a single-trial basis.
- **APPROACH:** Investigate filtering methods including simple and multistage band-pass filters and several transforms (Fourier, Hilbert, and Wavelet) using MATLAB simulation and testing to determine the optimal filter design.
- **INITIAL RESULTS:**
 - Adaptive filter produced comparable results using 10 events to current neuroscience method using 32 events.
 - Simulated real-time filtered data can identify some obvious P300 responses on single-trial, but waveform is not consistent enough for real-time analysis by visual inspection.
 - The root mean square deviation values are insufficient to evaluate filter performance.
- **FUTURE WORK:**
 - Further processing is required to yield generalizable results
 - Validation with known EEG classifiers

The result of band-pass filtering 1 – 100 hz and averaging over 32 events

By narrow band-passing the low frequencies (circled), the SNR is greatly improved.

- Miniaturization of EEG electrodes and haptic sensors
- Biocompatible reversibly adhesive EEG electrodes (“gektrodes”)
- Flexible electronics for sensors
- Bioplausible, multisensory control/decision making algorithms
- Development of robust fMRI sensors
- Self-organizing sensor arrays

Enable robust, in-battlefield detection

Enable enhanced sensing and information processing in noisy environments

Flexible electronics research,
John Rogers Group, UIUC

- Novel Sensors:
 - Miniaturization of EEG electrodes and haptic sensors
 - Biocompatible reversibly adhesive EEG electrodes (“gektrodes”)
 - Stretchable electronics for sensors
 - Development of robust fMRI sensors
 - Self-organizing sensor arrays
 - Bioplausible, multisensory control/decision making algorithms
 - Autonomous Systems
 - Human Physiological Monitoring
 - Computationally efficient algorithm development for robust, noisy applications
 - SOAR
 - CyberPhysical Sensors and Control
 - Adaptive EEG
- Enable robust, in-battlefield detection
- Enable enhanced sensing and information processing in noisy environments

- Research of Potential Interest
 - Cyber Physical Sensing and Control

September 2011

Popular Science 2011 Most Awesome Labs

8. Wind Science and Engineering Research Center

Texas Tech University
Career: Atmospheric scientist
Learn to: Measure hurricane damage. Students collect data about hurricanes and tornadoes by firing debris out of a cannon.
[PopSci Sept. 2007]

9. WOODS HOLE OCEANOGRAPHIC INSTITUTION

Woods Hole, Massachusetts [page 47]

10. Game Design Initiative

Cornell University
Career: Videogame designer
Learn to: Create your own game at the first Ivy to offer a minor in game design.
[PopSci Sept. 2008]

11. DIVISION OF GEOLOGICAL AND PLANETARY SCIENCES

California Institute of Technology [page 47]

12. Peruvian Amazon Field Course

New College of Florida
Career: Rainforest biologist
Learn to: Follow rare animals up 150-foot trees. With tree-climbing pioneer and ecologist Meg Lowman, students tag animals and survey biodiversity. [PopSci Sept. 2010]

13. U.S. ARMY RESEARCH LABORATORY

Adelphi, Maryland

14. Toy Lab

Massachusetts Institute of Technology
Career: Toy designer
Learn to: Build toys. Teams of six get a theme and \$750 for a prototype.
[PopSci Sept. 2010]

15. REED NUCLEAR REACTOR

Reed College [page 50]

16. Lightning Research Lab

University of Florida
Careers: Physicist, engineer
Learn to: Catch millions of volts from the sky by using rockets to draw lightning during passing storms. [PopSci Sept. 2007]

ROVING RESEARCH

Students Alec Koppel, Vishnu Ganesan and Keshi Jordan demonstrate the miniature robots they helped develop.

DESIGN A MICRODRONE

13. U.S. ARMY RESEARCH LABORATORY, Aberdeen Proving Ground

Careers: Defense researcher, engineer

Some of the students interning on the Micro-autonomous Systems Technology (MAST) project at the Army Research Lab in Maryland spend their summer trying to equip soldiers with dozens or even hundreds of "insect" robots that can swarm into a bunker or cave to provide a remote look inside. "Working in silicon at the fruit-fly scale, they'll cost almost nothing," says Chris Kroninger, an aeronautics researcher specializing in MAST's wings, "and they can be equipped with limited sensor capability that can be a first warning for a soldier."

Kroninger says the robots won't be deployed for another decade at least, and there's plenty of work yet to be done. That's true of most projects given to the 185 undergraduate students at the Army Research Lab every year. Whether they analyze body armor, develop new materials, or create miniaturized sensors, there's more going on than they can possibly be part of.

"A lot of these kids come in with a deer-in-the-headlights look," says 26-year-old

researcher John Gerdes, who was an intern in 2006. "But the ARL does such a good job of balancing realistic expectations with the proper amount of mentoring and resources, it's almost impossible not to succeed."

Aaron Harrington came to the ARL as a University of Maryland sophomore and wound up spending two more summers there. "I didn't know that research was something that you could go into," says Harrington, who is now 24 years old and earning a master's degree in aerospace engineering from his alma mater. In 2008, Kroninger assigned him to photograph wings flapping, which normal cameras will capture only as a blur. Using a strobe light to combat the blur and a technique called photogrammetry, Harrington used two cameras recording video at 30 frames per second. "If you had two cameras and knew how far apart they were and had some idea of the distance from the test bay," he says, "you could use triangulation to measure the distance. It turned out to be very accurate."
