

REPORT DOCUMENTATION PAGE				Form Approved OMB No. 0704-0188	
Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing this collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

13. SUPPLEMENTARY NOTES					
14. ABSTRACT 2D AutoDyn analyses of cylinder impact on ceramic plate have been conducted to identify the mesh size needed to capture detail crack growth in ceramic tiles Steel 4340 is used for the projectile and AutoDyn SiC material properties are used for the ceramic tile Mesh sensitivity analysis is performed using four different square mesh sizes: 0.50-mm x 0.50-mm square mesh 0.40-mm x 0.40-mm square mesh 0.30-mm x 0.30-mm square mesh 0.20-mm x 0.20-mm square mesh Results shows that 0.20-mm mesh size provides a fracture pattern that may be considered acceptable for analysis A conico-cylinder projectile is also used to study the fracture behavior with 0.20-mm mesh size We will develop 3D FEMs for further AutoDyn analyses An undergraduate student is working in the Summer 2013 session, and we are planning to recruit a graduate student in the Fall					
15. SUBJECT TERMS 2D AutoDyn modeling, cylinder impact, conico-cylinder impact, fracture pattern, mesh sensitivity

**MONTHLY REPORT
MAY 2013**

MODELING AND SIMULATION OF CERAMIC ARRAYS TO IMPROVE BALLISTIC PERFORMANCE

Monthly Report for May 2013

ABSTRACT

- ☐ 2D AutoDyn analyses of cylinder impact on ceramic plate have been conducted to identify the mesh size needed to capture detail crack growth in ceramic tiles
- ☐ Steel 4340 is used for the projectile and AutoDyn SiC material properties are used for the ceramic tile
- ☐ Mesh sensitivity analysis is performed using four different square mesh sizes:
 - ☐ 0.50-mm x 0.50-mm square mesh
 - ☐ 0.40-mm x 0.40-mm square mesh
 - ☐ 0.30-mm x 0.30-mm square mesh
 - ☐ 0.20-mm x 0.20-mm square mesh
- ☐ Results shows that 0.20-mm mesh size provides a fracture pattern that may be considered acceptable for analysis
- ☐ A conico-cylinder projectile is also used to study the fracture behavior with 0.20-mm mesh size
- ☐ We will develop 3D FEMs for further AutoDyn analyses
- ☐ An undergraduate student is working in the Summer 2013 session, and we are planning to recruit a graduate student in the Fall 2013 session

SUBJECT TERMS

- ☐ 2D AutoDyn modeling, cylinder impact, conico-cylinder impact, fracture pattern, mesh sensitivity

Axi-Symmetric Model Geometry

Gap between target and projectile = 0.14-mm

X-axis is axis of rotation

$$V_P = 500 \frac{\text{mm}}{\text{ms}}$$
