1.0 INTRODUCTION

As a revision to Contract #W56HZV-05-0721 (WD-FH-0004), this task was added to the current project for the purpose of performing material characterizations and developing Johnson-Cook (J-C) strength and damage constants of friction stir welded (FSW) ballistic joints. These material constants will be used by the government for ballistic, blast and other types of modeling and simulation, and will be included in the Elastic Plastic Impact Code (EPIC) library. This report describes the welding and machining processes used to manufacture the material test specimens used for the J-C material characterization tests and provides the results of metallurgical analysis for the FSW joint of each selected armor material.

At the onset of this project, U.S. Army TARDEC personnel identified six armor materials (See Table 1-1) which were either currently in use or under consideration for future use for ballistic structures and had not undergone FSW joint material strength characterization. Due to budgetary limitations, only three of these materials were selected for J-C analysis: 6061, 5083, and 2139 aluminum alloys. TARDEC wanted high-hardness steel armor to be one of the chosen materials however preliminary FSW tool trials using a tungsten-rhenium tool to weld ½-inch thick plate of this material indicated that excessive tool wear would prohibit its inclusion in this study. Development of FSW weld joints of high-hardness steel armor are continuing at FH-CAT with the goal of including this material in a future J-C material characterization study.

TABLE 1-1: Ballistic Armor Materials

Selected for J-C Analysis	1. 6061-T6511 aluminum alloy, Class 1, MIL-DTL-32262
	2. Steel - high-hardness, MIL-DTL-46100E
	3. 5083-H131 aluminum alloy, Class 1, MIL-DTL-46027K
	4. 2139-T8 aluminum alloy, Class 1, MIL-DTL-32341
	5. 2195-T64 aluminum alloy, Class 2, MIL-DTL-32341
	6. Steel – homogeneous, Class 1 or 2, MIL-DTL-12560J

2.0 WELD COUPON MANUFACTURING

2.1 Material

The 6061 aluminum armor used for this project was manufactured by Kaiser Aluminum (Fairfield, IL) and was delivered as 1-in. x 2-in. x 12-ft. bars (Lot #Z00222015). The full-length bars were then cut into 8-in. lengths¹ using a band saw with cooling fluid.

The 2139 aluminum armor used for this project was manufactured by Alcan Rolled Products (Ravenswood, WV). Due to the limited availability of this experimental armor, it was delivered as three large plates: one 1-in. x 24-in. x 47.5-in. (Lot #820081) and two 1-in. x 48-in. x 48 in. (Lot # 820091). The plates were cut into 2-in. wide bars using a water-jet machine and these bars were then cut into 8-in. lengths using a band saw with cooling fluid. One side of each bar was milled to remove the surface finish left by the water-jet cutting process.

The 5083 aluminum armor used for this project was also manufactured by Alcan and originally delivered to Sunshine Metals (Glenpool, OK) as a 1 1/8-in. x 20-in. x 170-in. plate (Lot #125831). At Sunshine, the plate was then milled to 1.0-in. thick and then sawed into the 12-in. x 156-in. plate that was subsequently delivered to FH-CAT². The plate was then cut into 2-in. x 8-in. segments using a band saw with cooling fluid. One side of each bar was milled to remove the saw marks.

2.2 Coupon Production

The weld coupons (Figure 2-1) were all manufactured on the same FH-CAT FSW machine, a Transformation Technologies, Inc. (Elkhart, IN) Model GG1 (Figure 2-2), in single batches for each material. For all three materials, an FSW tool made of H13 tool steel with a scrolled pin and shoulder (See Figure 2-3) was used however the different heat requirements of the materials required that different tool shoulder diameters be used; 50.8-mm for 6061 and 40-mm for 5083 and 2139. The 6061 coupons were

¹At the beginning of this expedited project an FSW coupon fixture and machine program that was currently in use at FH-CAT at that time was used for coupon manufacturing.

² This 12-in. wide plate was originally ordered as material for ballistic target weldments.

completed on July 11, 2011, the 5083 coupons on August 2, 2011, and the 2139 coupons on November 9, 2011.

Figure 2-1: 6061 FSW Coupon

Figure 2-2: Friction Stir Weld Machine

Figure 2-3: FSW Tool (40-mm dia. shown)

Other than the material-specific welding parameters shown in Table 2-1, the manufacturing of each coupon followed the following process:

1. Clean two material bars with ethyl alcohol and a disposable towel.
2. Blow debris from the fixture using a compressed air nozzle.
3. Place the bars into the fixture (See Figure 2-4), with the square/milled sides at the joint, and tighten the fixture clamps with a hex head torque wrench (25 ft-lbs).
4. Inspect the material installation to confirm proper positioning and fit.
5. Using machine manual mode, lower the spindle so that the FSW tool tip is near the top of the material bars. The exact point of where the tip contacts the material is then found using the manual mode micro adjustment knob.
Recalibrate the Z-axis positioning to account for fixture height variations caused by heat variations.
6. Initiate the CNC welding program via the machine's operator interface panel.
7. Visually monitor the entire welding cycle.
8. Upon completion of the automated welding cycle, the welded coupon remains in the fixture for 1-2 minutes to allow cooling.
9. Visually inspect the quality of the weld.
10. After the in-fixture cooling period, release the clamps and transfer the coupon to the machine's bed plate to allow it to cool to room temperature.
11. During this cooling step, mark the coupon with a sequential number using a paint pen.
12. Allow the empty fixture to cool before installing the next set of material bars.
(The cooling period was 10 minutes minimum for the 6061 and 5083 materials. Due to high spindle torque during welding of 2139 coupons, the fixture and machine were cooled for a minimum of 30 minutes.)

On several occasions for all material batches, the time span between individual coupon welding was several hours to several days because of personnel and shop work schedules.

Table 2-1: FSW Coupon Process Parameters

	<i>Tool Shoulder Dia. (mm)</i>	<i>Rotation (RPM)</i>	<i>Traverse Speed (mm/min)</i>	<i>Axial Force (kN)</i>	<i>Tilt Angle (deg.)</i>	<i>Tool Coolant</i>
6061	50.8	450	150	45	2	no
5083	40.0	300	25	33	3	yes
2139	40.0	250	40	43	3	yes

**Figure 2-4: Coupon Weld Fixture**

As preparation for X-ray inspection of the welds, each coupon was machined to remove the inherent FSW flaws. Both ends of the coupons were removed using a laboratory precision wet saw to remove the weld starts and exit holes and to set the final coupon lengths of 4.5-in. The top surface of each coupon was then milled to remove weld flash.

Each material batch of coupons was then X-ray inspected at Magna Chek Inc. (Madison Heights, MI). None of the coupons exhibited any internal flaws.

3.0 WELD JOINT METALLURGICAL ANALYSIS

3.1 Sample Preparation

After the material-specific FSW process parameters were optimized (See Appendix A for development process parameters.), a set of coupons was segmented using a laboratory wet saw to provide transverse weld joint samples for hardness evaluation, micrographs, scanning electron microscopy (SEM), electron backscatter diffraction (EBSD), and tensile strength analysis. As required, samples were mounted, polished, and/or chemical etched (Keller's reagent). The transverse tensile test specimens (ASTM E8 – flat, sub-size) were machined and tested at FH-CAT (See Figure 3-1).

Figure 3-1: FH-CAT Tensile Test Specimen Location

3.2 Microstructural Analysis

Microstructural analysis was conducted using a Nikon Eclipse LV150 optical microscope and a Zeiss EVO MA10 SEM. Images were obtained from the optical microscope using a calibrated digital camera, and Scentis software. Optical microscope images were captured at 500x magnification and SEM images were captured at 500x and 1000x magnifications. Figures 3-2, 3-3 and 3-4 show the microscopic results for Al 6061, Al 5083, and Al 2139 respectively.

Figure 3-2: Microscopic Views of 6061 FSW Joint

Figure 3-3: Microscopic Views of 5083 FSW Joint.

Figure 3-4: Microscopic Views of 2139 FSW Joint.

3.3 Microhardness

Microhardness charts were created using a Leco LM100AT hardness tester. Figure 3-5 compares the microhardness charts for the 6061, 5083, and 2139 FSW weld joints.

Figure 3-5 : FSW Joint Micro-Hardness (HV)

3.4 Electron Backscatter Diffraction

Further definition of the metallurgic grain structure across the weld joint was conducted using EBSD. Prepared FSW joint samples were analyzed with a Hikari/EDAX backscatter detection system mounted to a Zeiss EVO MA10 SEM. Figures 3-6, 3-7, and 3-8 show the EBSD results.

Figure 3-6: EBSD of 6061 FSW Joint

Figure 3-7: EBSD of 5083 FSW Joint

Figure 3-8: EBSD of 2139 FSW Joint

3.5 Tensile Strength

Tensile tests were conducted using an Instron Model 5982 universal testing machine with a strain rate of 1 mm/min. The force was measured using a 100 kN load cell, and elongation was measured using a 1-in. length extensometer. Table 3-1 compares the strength test results for all three FSW materials with their respective base materials. Figures 3-9, 3-10, and 3-11 show the stress vs. strain relationships of the FSW joints.

Table 3-1 : Tensile Test Results

	<i>Yield Strength (MPa)</i>	<i>Ultimate Yield (MPa)</i>	<i>% Elongation</i>
6061 FSW	194	270	7.06%
6061 Base	507	576	12%
% Change	-61.7%	-53.1%	-41.2%
5083 FSW	229	394	18.4%
5083 Base	333	442	19%
% Change	-31.2%	-10.9%	-3.2%
2139 FSW	235	405	14.9%
2139 Base	475	500	13.1%
% Change	-50.5%	-19.0%	13.7%

Figure 3-9: 6061 FSW Stress vs. Strain

Figure 3-10: 5083 FSW Stress vs. Strain

Figure 3-11: 2139 FSW Stress vs. Strain

3.5 J-C Test Specimen Location

SWRI selected the centerline positions of the final specimens using the coupon transverse micro-hardness chart (See Figure 3-12) and macro-etch sample for each material. While the weakest part of an FSW joint is typically the thermo-mechanically affected zone (TMAZ) where the softest material is found, commonality with a previous FSW joint characterization study³ was the driving factor for the positions selected for this project. For only the 2139 FSW zone material, the horizontal centerline of the specimen location was slightly lower (1.3-mm) than all other locations to avoid a small area of relatively harder material in the upper, advancing side of the FSW zone.

Figure 3-12: Specimen Locations

³ TARDEC Report 18.12544/026, *Mechanical Characterization of Friction Stir Welded Aluminum 5059-H131 (Weld and Heat Affected Zone) for Determination of Johnson-Cook Constitutive Constants*, Sep 2010, Southwest Research Institute, San Antonio, TX

4.0 FINAL SPECIMEN MACHINING

After returning from X-ray inspection, three specimen bars were longitudinally extracted from each FSW coupon; FSW zone, HAZ advancing side, and HAZ retreating side (See Figure 4-1).

Figure 4-1: Specimen Bar Coupon Locations

To duplicate previous J-C strength and damage studies of armor material conducted at SWRI, several different specimen configurations were required from each of the coupon specimen positions (See Table 4-1). See Appendix B for the specimen design prints and Appendix C for FH-CAT machining process descriptions.

For all of the specimen bars of the 6061 and 5083 material sets, one end was machined using a Cincinnati 630XT CNC machining center to a diameter of 0.75-in. (0.80-in. for B and E Notch Tension specimen bars) to aid subsequent processes. One end of $\frac{3}{4}$ -13 UNC-2A threads for the B and E Notch Tension specimen bars were also machined at this operation. Throughout the FH-CAT manufacturing process, material coupons, specimen bars, and specimens were segregated into separate bins, bags, and/or laser marked between process steps. Each specimen was individually bagged for shipping to SWRI.

6061 and 5083 base material .250 Tension specimens were initially produced as a machining process trial and then provided to SWRI for inspection and approval. With their approval, “production” manufacturing of the FSW test specimens began.

Table 4-1: J-C Test Specimens

Material Location	Test Type	Specimen Type	SWRI Dwg. No.	Qty
FSW ZONE	Quasistatic Tension	Threaded cylind. tensile	18-01147-510-5A	8
	B-Notched Tension	Threaded cylind. tensile	18-01147-510-3	4
	E-Notched Tension	Threaded cylind. tensile	18-01147-510-4	4
	SHPB Tension	Threaded cylind. tensile	"SHPB Tensile"	8

	Taylor Anvil	Cylinder L/D = 5	"T.A.I.T Specimen" 10-11-2005	10
HAZ RETREAT	Quasistatic Tension	Threaded cylind. tensile	18-01147-510-5A	4
	Taylor Anvil	Cylinder L/D = 5	"T.A.I.T Specimen" 10-11-2005	10
BASE	Quasistatic Tension	Threaded cylind. tensile	18-01147-510-5A	8

The Quasistatic Tension, SHPB Tension, SHPB Compression, and Taylor Anvil Impact Test specimens of the 6061 and 5083 materials were machined at FH-CAT. Due to machine resource limitations at FH-CAT, the machining of the 6061 and 5083 B-Notch Tension, E-Notch Tension, and Sub-size Torsion specimens and all of the 2139 specimens was done by the SWRI machine shop using FSW material blanks provided by FH-CAT.

The FH-CAT Quasistatic and SHPB Tension specimens were turned to final shape and threaded using a Mazak 100-III3 CNC machining center yielding one specimen per material blank. These specimens were then manually polished using a bench grinder with a 6-in. dia. sewn cotton buffing wheel. For the final operation, each tension

specimen was inserted into a ½-in. inside diameter plastic tube to protect the surface finish and then cut to final length using the Mazak 100. Figure 4-2 depicts the complete manufacturing process, material bars thru final machining, for the tension specimens.

The Taylor Anvil Impact Test (TAIT) specimen blanks were turned to 0.625-in. diameter using the Mazak 100 and subsequently turned to final diameter and rough length using a Hardinge Conquest T42 CNC lathe. This process yielded three specimens per material blank. The TAIT specimens were then milled to final length using a Cincinnati VMC500 CNC machining center.

The SHPB Compression specimens were turned to final diameter and rough length (four per blank) using the Hardinge CNC lathe and were then milled to final length using the Cincinnati VMC500.

FH-CAT Machining Processes

Focus: HOPE Process routing/Shop traveler

Customer: Southwest Research Institute		
Street Address:		
City State Zip:		
Stock: 4 x 4 1/2 x 1 coupon (8)		
Part Number:		
Description: Johnson-Cook Test Specimen Blocks 6061/5083		
Revision:		
Op No	Labor Code	Operation Description
10	Height Gage & Scribe	Find, and scribe weld centerline on ends of block.
20	Mill	Mill TOP to 0.875
30	Laser Marker	Mark TOP face of coupon per print (MMMM-X-TOP-NN, Where X=A,W, or R)
40	Mill	Mill BOTTOM to 0.750 thick
50	Mill	Mill coupon to 1.38 from weld centerline (retreating side)
60	Band Saw	Saw Block W .475 (minimum) from weld centerline (retreating side) SET ASIDE CUT OFF BLOCK "R"
70	Mill	Mill coupon to .375 from weld centerline (retreating side)
80	Mill	Flip around (TOP still facing up) and mill coupon to 1.75
90	Band Saw	Saw block at 'A' to .850 and remaining strip 'W' at .900 ref
100	Mill	Mill 'W' to .750 (from saw cut side)
110	Mill	Mill R to .750 (From saw cut side)
120	Mill	Mill A to .750 (from saw cut side)
130		Measurement of finished blocks, per inspection check sheet

Focus: HOPE Process routing/Shop traveler

Customer: Southwest Research Institute		
Street Address:		
City State Zip:		
Stock: 3/4 x 3/4 x 4 1/2 coupon (8)		
Part Number: SHPB Tensile (5083/6061)		
Description: Johnson-Cook test specimen		
Revision:		
Op No	Labor Code	Operation Description
		See 'Strips' Process Sheet for initial specimen extraction operations.
		Extreme care must be taken to keep Specimen Types R, W, and A, and Materials 6061 and 5083 properly segregated. THIS IS EXTREMELY IMPORTANT,
10		Confirm that all material blocks are marked "6061-W"
20	Mill	Square mill end, round (circular interpolate) end to 0.70 dia x 0.88 and center drill
30	Laser	Mark end "61W-#" (where # = 1 thru 8)
40	Mill	Mill end square, center drill, rough contour turn, final contour turn, single point thread, and finally turn thread OD to .490 dia
50	laser marker	Mark 2 Places (ends) "61W-#" (where # = 1 thru 8)
60		Individually bag each part
70		Label Bags
80		Polish Longitudinally
90		Cut-off to final length 2.235
