LONG-TERM GOALS

Improve the simulation of atmospheric radiation energy fields in Navy operational weather forecast models, such as the current NAVGEM, by the implementation of modern cloud and radiation parameterizations.

OBJECTIVES

1. Design a parameterization for translating prognostic cloud attributes (liquid or ice water content, drop size, layer cloud fraction) in NAVGEM to quantities that will become the input stream to an atmospheric radiation code. Examples are optical thickness, single scattering albedo and fractional cloud overlap.
2. Implement a cloud overlap scheme for NAVGEM.

APPROACH

1. Run a modern radiation code designed for global models, RRTMG SW and LW (Mlawer et al. 1997, Iacono et al. 2008) in off-line mode for clear skies and prescribed cloud properties on local (Purdue University) computers using the default RRTMG cloud prescriptions.
2. Port a Single Column Model (SCM) version of NAVGEM to the local computer for time-stepped runs at two representative grid points. The grid points chosen correspond to Atmospheric Radiation Measurement (ARM) surface sites (<http://www.arm.gov/sites>) for which observations are available (Oreopoulos and Mlawer, 2010).
3. Conduct sensitivity tests to modify the relationship between cloud microphysics and cloud cover properties and optical properties such as spectral band average optical thickness and single scattering albedo that are appropriate for NAVGEM, i.e. modify the default cloud optical properties prescribed in RRTMG.

Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

WORK COMPLETED

Objective 1 above has been concluded successfully for prescribed input provided by Dr. Ming Liu of NRL Monterey. We have tested RRTMG on Purdue cluster computer RADON and matched results with NRL for four profiles. The results section following shows a select comparison of input and output. We are now assured that differences in machine and compiler will not be an impediment in the implementation of our off-line efforts into NAVGEM at NRL.

RESULTS

Since we have just started this project, results are available only for the comparison of RRTMG off-line computations for four actual locations and times extracted from the operational model. This initial test was necessary because we wanted to assure ourselves that the bulk of the project and any follow-on could be done at Purdue on our local computer cluster and not require runs at NRL Monterey. For illustration purposes we are showing the comparison of input and output for a tropical location in the Indian Ocean, 60E, 0.5N. Figures 1 through 4 show input parameters to RRTMG whereas Figures 5 through 12 show the output shortwave and longwave radiation fluxes and cooling rates. Results are identical to seven significant figures indicating that our local machines are compatible with NRL machines.

The next step is to port the single column model and actual time step RRTMG through a cycle for a particular location. We have chosen DOE ARM (Atmospheric Radiation Measurement) sites for the SCM. Dr. Liu will send us the code and input parameters shortly. We expect to complete this phase prior to the PI visit to NRL Monterey in December 2013. This pilot project expires at the end of the calendar year. A follow-on proposal will be submitted after consultation with NRL personnel.

IMPACT/APPLICATIONS

The goal of this proposal is for an improved modeling system that can be used for forecasts out to seasonal time scales, as stated in the ONR announcement. The payoff will be improved global prediction systems capable of producing useful monthly and seasonal forecasts. These forecasts would provide valuable guidance on phenomena of particular interest to the Department of Defense.
