

Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

LONG-TERM GOALS

My work involves experimentally investigating the interrelationships and variability of optical properties in the ocean and atmosphere. My goal is to define the variability of the optical properties, particularly those dealing with light scattering, and to improve the prediction capabilities of image and radiative transfer models used in the ocean. My near term ocean optics objectives have been: 1) to improve the measurement capability of measuring the in-water and above-water spectral radiance distribution and extending this capability to polarization, 2) to investigate the variability of the Point Spread Function (PSF) as it relates to the imaging properties of the ocean, and 3) to improve the characterization of the Bi-directional Reflectance Distribution Function (BRDF) of benthic surfaces in the ocean, and 4) to understand the capabilities and limitations of using radiative transfer to model the BRDF of particulate surfaces.

OBJECTIVES

The original PI on this grant, Tony Elfouhaily, passed away. I have now taken over this grant, but the objectives have changed as the work is now combined with my work looking at the downwelling spectral polarized radiance distribution, in the near surface of the ocean. The final change occurred in mid September, so there is little to report in terms of progress here.

APPROACH

Please see associated report "Use of the polarized radiance distribution camera system in the RADO program". This report explains our progress to date.

WORK COMPLETED

This project was just transferred to me in Mid September, so there are no tasks completed.

RESULTS

The instrument has just been finished so there are now significant results at this time. .

IMPACT/APPLICATIONS

See “Use of the polarized radiance distribution camera system in the RADO program”

RELATED PROJECTS

This project is part of the overall ONR RadYO program. We also have DURIP support to build the instrument, fundamental to this work. Our work on the polarized radiance distribution is also related to our efforts with NASA funding to look at both the upwelling radiance distribution and the polarized upwelling radiance distribution. This project is actually directly part of my other work: “Use of the polarized radiance distribution camera system in the RADO program”
