Report Title

Final Project – Modeling Interval Temporal Dependencies for Complex Activities Understanding

ABSTRACT

Complex activity typically consists of temporally sequential or overlapping primitive events occurring over a time interval. The existing dynamic models are point-based and they cannot effectively model event temporal dependences. To overcome this limitation, we introduce the Interval Temporal Bayesian Network (ITBN), a novel graphical model that combines the Bayesian Network with the Interval Algebra, to explicitly model the temporal dependencies over time intervals. Furthermore, to handle the challenge with explicit primitive event detection and tracking in real world videos, we propose to use topic models to perform implicit event detection. Combining ITBN model with the topic models yields a powerful framework that can perform complex activity recognition without explicit primitive event detection and tracking. The proposed framework is evaluated on two computer vision applications: human body activity recognition and human facial activity recognition.

Student Metrics

This section only applies to graduating undergraduates supported by this agreement in this reporting period

The number of undergraduates funded by this agreement who graduated during this period: 0.00

The number of undergraduates funded by this agreement who graduated during this period with a degree in science, mathematics, engineering, or technology fields:..... 0.00

The number of undergraduates funded by your agreement who graduated during this period and will continue to pursue a graduate or Ph.D. degree in science, mathematics, engineering, or technology fields:..... 0.00

Number of graduating undergraduates who achieved a 3.5 GPA to 4.0 (4.0 max scale): 0.00

Number of graduating undergraduates funded by a DoD funded Center of Excellence grant for Education, Research and Engineering:..... 0.00

The number of undergraduates funded by your agreement who graduated during this period and intend to work for the Department of Defense 0.00

The number of undergraduates funded by your agreement who graduated during this period and will receive scholarships or fellowships for further studies in science, mathematics, engineering or technology fields: 0.00

Scientific Progress

Through this project, our accomplishments can be summarized as follows

- 1) we developed and implemented the proposed Interval Temporal Bayesian Network (ITBN) to model and capture complex spatiotemporal relationships among primitive events.
- 2) We further implemented a topic model to perform implicit primitive event detection and tracking, and integrated the topic model with the ITBN model to perform complex activity recognition without explicit event detection and tracking.
- 3) We demonstrated the integrated model for two computer vision applications: human activity recognition and facial activity recognition. The results demonstrate the superior performance of the proposed framework to the existing dynamic models.
- 4) We published the results from this research in top computer vision journal (IEEE PAMI)and conference (IEEE CVPR).
