

AWARD NUMBER: W81XWH-13-2-0043

TITLE: Lumbar Spine Musculoskeletal Physiology and Biomechanics
During Simulated Military Operations

PRINCIPAL INVESTIGATOR: Dr. Samuel R. Ward

CONTRACTING ORGANIZATION: University of California, San Diego
La Jolla, CA 92093

REPORT DATE: June 2014

TYPE OF REPORT: Annual

PREPARED FOR: U.S. Army Medical Research and Materiel Command
Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release;
Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.

REPORT DOCUMENTATION PAGE				Form Approved OMB No. 0704-0188	
Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing this collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

13. SUPPLEMENTARY NOTES					
14. ABSTRACT This study evaluated the relationship between 3D geometry of the lumbar spine, under different loading conditions and positions, and the pathophysiology of the intervertebral disc and lumbar trunk muscles. 30 Marines were scanned using upright MRI in a normal standing position, standing with body armor (11.3kg), sitting with body armor, and prone on elbows with body armor. Additionally, 28 of the Marines were scanned in a high-resolution 3T MRI scanner to quantify muscle quality and intervertebral disc degeneration. Significant decreases in lumbar lordosis were found through all levels except L1-L2 when sitting. When prone on elbows, the only increase in lumbar lordosis was found at L5-S1. An increase in fat fraction of the erector spinae from L4-S1 was found in subjects with a degenerated L5-S1 vertebra.

1. **INTRODUCTION:** The weights of loads carried into battle pose an injury and performance problem for the US Marines. Marine Corps assault loads range from 44kg for the rifleman to 61kg for the squad leader. These are well in excess of the recommended assault load of 22.7kg; 30% of body weight. Two things are clear: (1) Marines routinely carry more weight than the recommended limit, and (2) the Veterans Administration shows an increasing trend in disabilities related to lower back injury as a result of carrying excessive loads in operational environments. We have implemented new MRI technologies enabling quantification of lumbar spine kinematics under simulated march conditions. From these investigations, we have observed a large number (37.5%) of Marines with some evidence of disc pathology. However, it is unclear if these disc changes, or the expected concomitant muscle changes, are related to kinematic changes in the lumbar spine. Further, it is not known whether pre-existing disc pathology predicts future injury and service life in U.S. Marines. Our central hypothesis is that lumbar disc and muscle degeneration alters the kinematic response of the lumbar spine to functional positions and loads, predisposing individuals to injury.
2. **KEYWORDS:** Spine, Lumbar, Kinematics, Muscle Architecture, Low Back Pain, Position
3. **ACCOMPLISHMENTS:**
 - **What were the major goals of the project?**
 - Major Goal 1: To compare lumbar spine kinematics in simulated operational conditions in Marines with measurable lumbar disc pathology
 - Task 1-Approved IRB Protocols
 - Local IRB Approvals
 - Due: 01 August 2013
 - Completed: 100%
 - HRPO Approvals
 - Due: 01 August 2013
 - Completed: 100%
 - Task 2-Subject battalions identified and coordinated
 - Subjects 1-33 recruited, consented and scheduled
 - Due: 01 February 2014
 - Completed: 91%
 - Subjects 34-66 recruited, consented and scheduled
 - Due: 01 August 2014
 - Completed: 0%
 - Subjects 67-100 recruited, consented and scheduled
 - Due: 01 Jan 2015
 - Completed: 0%
 - Task 3-Data Collection/Analysis

- Vertical data acquisition
 - Due: 01 December 2015
 - Completed: 30%
 - Vertical data analysis
 - Due: 01 February 2016
 - Completed: 30%
- Major Goal 2: To quantify changes in lumbar spine muscle architecture in Marines with measurable lumbar disc pathology.
 - Task 1-Approved IRB Protocols
 - Local IRB Approvals
 - Due: 01 August 2013
 - Completed: 100%
 - HRPO Approvals
 - Due: 01 August 2013
 - Completed: 100%
 - Task 2-Subject battalions identified and coordinated
 - Subjects 1-33 recruited, consented and scheduled
 - Due: 01 February 2014
 - Completed: 91%
 - Subjects 34-66 recruited, consented and scheduled
 - Due: 01 August 2014
 - Completed: 0%
 - Subjects 67-100 recruited, consented and scheduled
 - Due: 01 Jan 2015
 - Completed: 0%
 - Task 3-Data Collection/Analysis
 - Supine data acquisition
 - Due: 01 December 2015
 - Completed: 30%
 - Supine data analysis
 - Due: 01 February 2016
 - Completed: 0%
- **What was accomplished under these goals?**
- 30 Marines were scanned in an upright MRI machine in their normal standing position (StU; no load), standing with body armor (11.3 kg) (StL), sitting with body armor (SiL), and prone on elbows with body

armor (PL) positions. Digital seed points were manually placed on the corners and the posterior elements of each vertebra using OsiriX. The location of the seed points were imported into Matlab and used to define an endplate-based joint coordinate system applied to the superior and inferior endplate of each vertebra.

Figure 1. Angle with respect to horizontal and Sagittal Cobb angle measured for Standing Unloaded (St.U.), Standing Loaded (St.L.), Sitting Loaded (Si.L.) and Prone on Elbows Loaded (P.L.) Positions. There is significant straightening of the lumbar spine when sitting. There was no difference in posture in subjects with or without lumbar disc degeneration.

Figure 2. Sagittal intervertebral angle for each level of the lumbar spine in Standing Unloaded (St.U.), Standing Loaded (St.L.), Sitting Loaded (Si.L.) and Prone on Elbows Loaded (P.L.) Positions. There is significant straightening of the lumbar spine when sitting. The L5-S1 level has

the biggest contribution to extension. There was no difference in posture in subjects with or without lumbar disc degeneration.

- Supine 3T MRI images were acquired from 28 Marines. Psoas, Quadratus Lumborum and Erector Spinae muscles, and the Intervertebral disc were manually segmented using OsiriX. Physiologic measurements were made based on segmented tissues and structural anatomic scans. Average T2 value of the intervertebral disc was proportional to Pfirrmann grade as expected. There was a significant increase in the fat fraction of the Erector Spinae and Quadratus Lumborum Muscles in the lower lumbar spine in subjects with disc degeneration.

Figure 3. Muscle volume (top row) and fat fraction (bottom row) for the Erector Spinae (Left) Psoas (Center) and Quadratus Lumborum (Right) muscles at each level for patients with healthy (black) and degenerated (grey) L5-S1 intervertebral discs.

- **What opportunities for training and professional development has the project provided?**
 - Nothing to report
- **How were the results disseminated to communities of interest?**
 - Nothing to report
- **What do you plan to do during the next reporting period to accomplish the goals?**
 - During the next reporting period, we intend on completing supine data analysis from the first 30 subjects that we collected. Additionally, we intend on recruiting an additional 12 subjects to more closely investigate the effect of load magnitude and distribution on lumbar spine kinematics. By the end of the next reporting period, we intend on having at least one manuscript submitted for review from this project.

4. **IMPACT:**

- **What was the impact on the development of the principal discipline(s) of the project?**
 - The results of this study may inform a set of load carriage guidelines to be put in place, through changes in training practices, gear design and/or implementation of exercises to strengthen the

musculature of the spine. Additionally, the results of this study will allow researchers to better relate the complex 3D geometry of the lumbar spine in subjects with different levels of lumbar disc and degeneration and muscle health. The role of idiopathic lumbar back pain on lumbar spine kinematics will also allow us to investigate differences in the shape of the lumbar spine between a wide range of positions.

- **What was the impact on other disciplines?**

- Nothing to report

- **What was the impact on technology transfer?**

- Nothing to report

- **What was the impact on society beyond science and technology?**

- The broad impact is that the load recommendations determined from this study can be applied to anyone who works with their spine under awkward or loaded positions.

5. **CHANGES/PROBLEMS:**

- **Changes in approach and reasons for change**

- Nothing to report

- **Actual or anticipated problems or delays and actions or plans to resolve them**

- One adverse event has occurred: one subject experiences peripheral nerve stimulation and claustrophobia in the supine scanner (19/02/2014). He was immediately removed from the scanner and calmed down. For this subject, kinematic but not anatomical supine data was acquired.

- **Changes that had a significant impact on expenditures**

- Nothing to report

- **Significant changes in use or care of human subjects, vertebrate animals, biohazards, and/or select agents**

- Nothing to report

- **Significant changes in use or care of human subjects**

- Nothing to report

- **Significant changes in use or care of vertebrate animals.**

- Nothing to report

- **Significant changes in use of biohazards and/or select agents**

- Nothing to report

6. **PRODUCTS:**

- **Publications, conference papers, and presentations**

- **Journal publications.**

- Nothing to report

- **Books or other non-periodical, one-time publications.**

- Nothing to report

- **Other publications, conference papers, and presentations.**

- Nothing to report
- **Website(s) or other Internet site(s)**
 - Nothing to report
- **Technologies or techniques**
 - Nothing to report
- **Inventions, patent applications, and/or licenses**
 - Nothing to report
- **Other Products**
 - Nothing to report.

7. PARTICIPANTS & OTHER COLLABORATING ORGANIZATIONS

- **What individuals have worked on the project?**

Lumbar Spine Musculoskeletal Physiology and Biomechanics During Simulated Military Operations

PR120576:

W81XWH-13-2-0043

PI: Samuel Ward, Karen Kelly

Org: UC San Diego, NHRC

Award Amount: \$1,250,000.00

Study/Product Aim(s)

- To compare lumbar spine kinematics in simulated operational conditions in Marines with measureable disc pathology
- To quantify changes in lumbar spine muscle architecture in Marines with measureable lumbar disc pathology

Approach

Each Marine undergoes high-resolution structural and physiological imaging of the lumbar vertebrae and discs in a high strength (3T) supine MRI. Marines then undergo a 3D imaging protocol in an upright, low strength (0.6T) MRI in standing unloaded, standing loaded (25lb body armor), sitting loaded and prone on elbows positions. Back pain history is recorded for each subject at time of data collection.

Sample Sagittal T2-Weighted Scans in Standing Unloaded (A) Standing Loaded with 25 lbs. body armor (B) Sitting Loaded (C) Prone on Elbows Loaded (D). Points of interest were placed on the corner of each vertebrae for kinematic measurements.

Accomplishment: Scanning parameters for supine and upright MRI were optimized for best image quality. Data was collected from 30 subjects. Image quality is acceptable to preform all measurements.

Timeline and Cost

Activities	CY	13	14	15	16
Subject Battalion Identification and Coordination					
Supine and Vertical MRI Data collection					
Data Analysis					
Dissemination of Findings					
Estimated Budget (\$K)		\$195	\$000	\$000	\$000

Goals/Milestones

CY13 Goal – Initiate subject recruitment/scanning

☒ Begin acquiring data on minimum 8 subjects

CY14 Goals – Develop measurement tools

☒ Validate tool for measuring kinematics

☐ Diffusion Tensor Calculations

☐ Scan >40 subjects

CY15 Goal – Data Analysis

☐ Scan remaining subjects

☐ Analyze data from 80% of the subjects

CY16 Goal – Disseminate findings

☐ Correlate kinematic physiologic data

Comments/Challenges/Issues/Concerns

Nothing to Report

Budget Expenditure to Date

Projected Expenditure: \$195,000.00

Actual Expenditure: \$175,920.17

Updated: (20150311)
