Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

14. ABSTRACT UNITES is a unique interdisciplinary team with expertise spanning the environment (physical oceanography and bottom geology), ocean acoustics (propagation, ambient noise, reverberation and signal processing), and tactical sonar systems. The overall goals of the research are to enhance the understanding of the uncertainty in the ocean environment (including the sea bottom), characterize its impact on sonar system performance, and provide the Navy with guidance for understanding sonar system performance in the littoral. Professor Miller will be involved in the explicit calculation of the transfer of uncertainty from the environment through the sonar system outputs.

LONG-TERM GOALS

UNITES is a unique interdisciplinary team with expertise spanning the environment (physical oceanography and bottom geology), ocean acoustics (propagation, ambient noise, reverberation and signal processing), and tactical sonar systems. The overall goals of the research are to enhance the understanding of the uncertainty in the ocean environment (including the sea bottom), characterize its impact on sonar system performance, and provide the Navy with guidance for understanding sonar system performance in the littoral. Professor Miller will be involved in the explicit calculation of the transfer of uncertainty from the environment through the sonar system outputs.

OBJECTIVES

Specific objectives of the team effort are to:

- 1) Develop generic methods for efficiently and simply characterizing, parameterizing, and prioritizing sonar system variabilities and uncertainties arising from regional scales and processes.
- 2) Construct, calibrate and evaluate uncertainty and variability models, for the sonar systems and its components, to address forward and backward transfer of uncertainties.
- 3) Transfer uncertainties from the acoustic environment to the sonar and its signal processing, in order to effectively characterize and understand sonar performance and predictions.

APPROACH

Our technical approach is based on utilizing environmental probability density functions (PDF) to provide a description of sonar performance. The PDFs will be determined for appropriate spatial and temporal scales as dictated by the systems under consideration. In particular, these PDFs will be determined for the following: meso- and sub-mesoscale fronts and eddies, tides, internal tides, waves and solitons, interference variability (ambient noise and reverberation) and spatially variable bottoms. Professor Miller will work with teammates on design, performance and evaluation of Monte-Carlo experiments which will be used to calculate explicit PDF's, and evaluation of the resulting PDF's themselves.

WORK COMPLETED

Professor Miller attended the ONR Kick-Off Meeting held at University of Washington, Applied Research Laboratory in June 27 and 28, 2001 and contributed to the presentation of an overview of the UNITES Team Approach. The presentation, entitled "Uncertainties and Interdisciplinary Transfers Through the End-to-End System (UNITES): The UNITES Team Approach" was presented by Allan Robinson (Harvard University) and Phil Abbot.

RESULTS

IMPACT/APPLICATIONS

The primary application is to assist the sonar "prediction community" by providing a probabilistic representation of sonar system performance. The present approach provides a systematic method to incorporate uncertainties due to the environment and to transfer the effects of these uncertainties, in the end-to-end problem through the sonar systems under consideration. The operator can thus use this information to operate the system more effectively and make more informed decisions on search, risk, expenditure of assets (weapons) and assumptions of covertness.

TRANSITIONS

RELATED PROJECTS

"Theory and Practice of Data Assimilation in Ocean Models" is an ongoing project sponsored by ONR with Professor Miller as PI. Recent work has emphasized calculation of PDF's of an increasingly complex sequence of strongly nonlinear models. Work was begun with highly schematic models. Succeeding models capture more and more properties of realistic ocean models.
