

Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

LONG-TERM GOALS

My long term goal is to characterize relationships between remotely sensed ocean color and vertical profiles of bio-optical properties in the East China and Yellow Seas.

OBJECTIVES

I plan to (1) characterize the vertical distribution of the inherent and apparent optical properties by measuring spectral downwelling and upwelling irradiance, spectral upwelling radiance, spectral beam transmission, and spectral absorption in various bio-optical water masses. From this spectral data, the diffuse attenuation and absorption coefficients, irradiance reflectances, remote sensing reflectances, surface water-leaving radiances and beam attenuation coefficients will be determined, (2) determine the concentration and distribution of the various phytoplankton pigments (Chlorophylls, chlorophyll degradation products, and carotenoids) using a high-performance liquid chromatography (HPLC). In addition, chlorophyll *a* and phaeopigment concentrations will be determined by the standard fluorometric method, providing a direct link to past CZCS pigment algorithms and assisting in SeaWiFS, MODIS and NEMO/COIS derived product comparisons, and (3) establish locally derived, in-water algorithms relating remote sensing reflectance spectra to diffuse attenuation and absorption coefficients and phytoplankton pigment concentrations.

APPROACH

We plan a 7 day cruise on a Chinese research vessel to study the spatial variability of bio-optical properties from the mouth of the Yantzee River to offshore areas. We will sample and study the bio-optical properties of Chinese coastal waters.

WORK COMPLETED

The award was not received by San Diego State University until 14 September 1999 due to an error in the mailing address. There have been no expenditures as SDSU is still in the process of setting up an account for the award.

RESULTS

This project has not started yet.

IMPACT/APPLICATIONS

This project will provide a bio-optical characterization of the S. China Sea, an undersampled region.

TRANSITIONS

None yet.

RELATED PROJECTS

None.
