EXPLANATORY NOTE

Presentation Version

This report consists of reproductions of the slides comprising the presentation given at the Third ICRPG/AIAA Solid Propulsion Conference in Atlantic City, New Jersey on June 4-6, 1968. As such it does not include the verbal explanations that accompanied the slides. No manuscript was prepared for the Conference, but it is hoped that, despite its terseness, this document will serve as a useful summary of the material presented at the Conference. Work on this topic is still continuing and a later report will include revisions of these results along with new results.

EXTINGUISHMENT OF SOLID PROPELLANT FLAMES:

A THEORY BASED ON A NEW FEEDBACK LAW

by

C. L. Merkle and M. Summerfield

Guggenheim Laboratories, Princeton University

Sponsored by ONR Contract Nonr 1858(32)

Supervised by the Power Branch

of the Office of Naval Research

This paper includes:

1. A critical examination of previous theories of extinguishment and reasons for a new approach.
2. A new theory of non-steady burning based on the KTSS flame model for an AP composite propellant.
3. Predictions of the time variation of burning rate, surface temperature, and flame temperature during rapid depressurization:
 - a) Extinguishment case.
 - b) Non-extinguishment case.
4. Predictions of the effects of oxidizer loading and aluminum content on the difficulty of extinguishment.
5. Comparison of the predictions with experimental results of Ciepluch and others.

CRITICAL INITIAL DEPRESSURIZATION RATE

$\frac{dp}{dt} \text{ (psi/sec} \times 10^{-3})$

DIFFICULTY OF EXTINCTION BY DEPRESSURIZATION:
EXPERIMENTAL DATA

CRITICAL INITIAL DEPRESSURIZATION RATE

$dp/dt \text{ (psi/sec. } \times 10^{-3} \text{)}$

DIFFICULTY OF EXTINCTION BY DEPRESSURIZATION
COMPOSITE OF EXPERIMENTAL DATA

PRESSURE-FREQUENCY REGIMES OF ACOUSTIC INTERACTION WITH COMBUSTION ZONE

KTSS MODEL FOR NONSTEADY SOLID PROPELLANT BURNING

HEAT RELEASE PARAMETER

$$H = \frac{Q_s}{c_s(T_{so} - T_\infty)}$$

ENERGY EQUATION FOR GAS PHASE

$$\lambda_g \frac{d^2 T}{dx^2} + r \rho_p c \frac{dT}{dx} + \rho_g Q_f \dot{\epsilon} = 0$$

$$-\lambda_g \left(\frac{\partial T}{\partial x} \right)_s = \frac{\phi(p)}{r} [1 - \exp\{-\rho_p r^2 Q_f / \phi(p)\}]$$

$$\phi(p) = \frac{\lambda_g Q_f \rho_g}{\rho_p c \tau_c}$$

EVALUATION OF $\phi(p)$ AT STEADY STATE

$$q_g = \frac{\phi(p)}{\bar{r}} [1 - \exp - \rho_p(\bar{r})^2 Q_f / \phi(p)]$$

$$q_g = \rho_p \bar{r} [c(T_s - T_\infty) - Q_s]$$

$$\bar{r} = ap^n$$

$$\phi(p) = \frac{\rho_p(ap^n)^2 [c(T_s - T_\infty) - Q_s]}{[1 - \exp\{-\rho_p(ap^n)^2 Q_f / \phi(p)\}]}.$$

ENERGY EQUATION FOR SOLID PHASE

$$\frac{\partial T}{\partial t} = r(t) \frac{\partial T}{\partial x} + \alpha \frac{\partial^2 T}{\partial x^2}$$

$$\text{where } r(t) = A \exp(-E_s/RT_s)$$

B. C.

$$-\lambda_p \left(\frac{\partial T}{\partial x} \right)_s = q_g + r \rho_p Q_s$$

$$T(\infty) = T_\infty$$

$$T(x, 0) = (T_{s,0} - T_\infty) \exp(-xr_0/\alpha)$$

EXPONENTIAL PRESSURE DECAY
USED IN DEPRESSURIZATION ANALYSIS

PREDICTED HISTORY OF FLAME TEMPERATURE DURING RAPID DEPRESSURIZATION

13

NON-DIMENSIONAL SURF. TEMP. $\theta_s = \frac{T_s - 300}{900 - 300}$
AND
NON-DIMENSIONAL BURNING RATE $(R = r/r_0)$

PREDICTED HISTORY OF SURFACE TEMPERATURE AND BURNING RATE
DURING RAPID DEPRESSURIZATION

DIFFICULTY OF EXTINCTION BY DEPRESSURIZATION:
EFFECT OF PRESSURE DROP

DIFFICULTY OF EXTINCTION BY DEPRESSURIZATION:
COMPARISON OF THEORY AND EXPERIMENT

DIFFICULTY OF EXTINCTION BY DEPRESSURIZATION
EFFECT OF AP LOADING (O/F) RATIO

PREDICTED HISTORY OF FLAME TEMPERATURE
 DURING RAPID DEPRESSURIZATION TO EXTINGUISHMENT

PREDICTED HISTORY OF SURFACE TEMPERATURE AND BURNING RATE
DURING RAPID DEPRESSURIZATION TO EXTINGUISHMENT

DIFFICULTY OF EXTINCTION BY DEPRESSURIZATION:
EFFECT OF ADDITION OF ALUMINUM

In conclusion we have shown that:

1. A theory based on the KTSS dynamic flame model (surface heat release plus granular diffusion flame) predicts qualitatively the observed extinguishment behavior.
2. An aluminized propellant is more difficult to extinguish than a non-aluminized one having the same AP binder ratio.
3. The low pressure part of the depressurization transient is the most critical in determining whether extinction will occur.
4. To improve the predictions, the theory will have to incorporate a more exact description of the entire burning rate curve.
