19. ABSTRACT (Continue on reverse if necessary and identify by block number) The purpose of this program is to evaluate the efficacy of candidate antiviral compounds against a spectrum of viruses of military importance. This program involves (a) primary testing of chemical compounds and natural products for antiviral activity <i>in vitro</i> using standard CPE-inhibition assays, (b) primary testing of compounds for antiviral efficacy <i>in vivo</i> in animal model systems, and (c) secondary evaluation of the active candidate antiviral compounds. The target viruses for <i>in vitro</i> testing are Vaccinia Virus (VV), Adenovirus (AD2), Vesicular Stomatitis Virus (VSV), Punta Toro Virus (PT), Sandfly Virus (SF), Yellow Fever Virus (YF), Venezuelan Equine Encephalomyelitis Virus (VE), Japanese Encephalitis Virus (JE), Pichinde Virus (PIC), Hantaan Virus (HTN), and Human Immunodeficiency Virus (HIV). The <i>in vivo</i> systems are Pichinde Virus infection of hamsters, Venezuelan Equine Encephalomyelitis Virus, Japanese Encephalitis Virus and Vaccinia Virus infections of mice. Approximately 10,000 compounds have been received for <i>in vitro</i> evaluation and over 66,000 assays have been performed on this contract. Compounds have been identified in nearly all virus systems that have confirmed antiviral activity equal or exceeding that of the various positive control compounds (Ribavirin, Selenazofurin, Carbocyclic-3-adenosine, Adenosine dialdehyde, Ara-A, ddC and AZT). Many of these compounds represent potent and selective antiviral agents.

- DIFFRNTL = DIFFRNTL is the abbreviation for the differential. The differential is the difference in the cell control and the virus control optical densities. A differential value of >0.5 is required for the assay to be considered satisfactory.
- IC₅₀ = The minimum drug concentration (µg/ml) that inhibited the CPE by 50%, calculated by using a regression analysis program for semilog curve fitting.
- TC₂₅ = The minimum drug concentration (µg/ml) that reduced cell viability by 25%.
- SI = Selectivity Index, calculated by dividing the TC₂₅ by the IC₅₀.
- TAI = Total Antiviral Index is the area between the cytotoxicity and the antiviral curves.

- TC₂₅ = The minimum drug concentration (µg/ml) that reduced cell viability by 25%.
- IC₅₀ = The minimum drug concentration (µg/ml) that inhibited the CPE by 50%, calculated by using a regression analysis program for semilog curve fitting.
- SI = Selectivity Index, calculated by dividing the TC₂₅ by the IC₅₀.
