ARMY AIR FORCES
 MATERIEL ~~ENGINEERING~~ COMMAND
 ENGINEERING DIVISION
 MEMORANDUM REPORT ON

FER:gbk:49

Date: June 5, 1943

SUBJECT: Articulated Plastic Manikin Standards.

LABORATORY
~~ENGINEERING~~ Aero Medical

SERIAL NO ENG-49-695-28

Contract No.
 Expenditure Order No. 695-
 Purchase Order No.A. Purpose:

1. To report the construction of three plastic manikins designed for use in size studies in aircraft design and related subjects.

B. Factual Data:

1. Two thousand nine hundred and sixty-one Aviation Cadets were studied anthropometrically and reported in Materiel Command Memorandum Report No. EXP-M-49-695-48, dated October 5, 1942, subject: "Anthropometric Data on Army Air Forces Flying Personnel." The data obtained were analyzed on the basis of total stature range, shown in Exhibit A, which was divided into equal thirds. From these three equal divisions in stature, the corresponding populations were taken and the total set of data on each sub-series was averaged. These three sets of averages were then utilized in establishing the dimensions required for three arbitrary manikin standards, termed Type A, Type B, and Type C. Type A represents an average of the entire series. Type B represents an average of the dimensions obtained in the sub-series falling into the short third of the stature range. Type C represents an average of the dimensions obtained in the sub-series falling in the long third. The values of the dimensions are listed in Exhibit B. The pictographic demonstrations of these various measurements are shown in Exhibit C. A scale drawing of each of the three sizes, in various views, is given in Exhibit D.

2. Actual percentages of the total series falling into the size group are: Type B, 17.3 per cent; Type C, 9.4 per cent; and Type A, representing the 100 per cent distribution. The lack of balance between Type B and Type C is due to the fact that selection has occurred which cuts off the lower limit of the size distribution somewhat above the actual lower limit of general size ranges so that the entire distribution curve has its mode moved somewhat toward the lower limit. This lack of balance has only statistical interest - no practical importance, since the original classification was based upon equal thirds of the range. The total range obtained was 156 to 198 centimeters; Type B falls in a range 156-169 centimeters; and Type C falls in a range 184-198 centimeters.

Engineering Division
Memorandum Report No. ENG-49-695-28
June 5, 1943

3. From the three sets of data described above, specifications were established for construction of three-dimensional manikins made of plastic and articulated in such a manner that they might attain most positions encounterable in movements of the human body.

4. Mr. G. W. Borkland, 515 South Laflin Street, Chicago, Illinois, was contracted to sculpt three basic reference statues from which the plastic manikins could be designed.

5. The General Plastics Corporation, 515 South Laflin Street, Chicago, Illinois, was contracted to construct the manikins. A photograph of the Type A manikin is shown in Exhibit E. The manikins B and C follow this same construction.

6. Inasmuch as the plastic manikins cannot attain full movement exhibited by the human body, certain correction factors must be utilized in actual performance of the manikins. Type A must have the total span corrected by the addition of $2 \frac{1}{16}$ inches to obtain the calculated value. The anterior arm reach must be corrected by the addition of $2 \frac{1}{2}$ inches for the attainment of the calculated value. Type B must have the total span corrected by the addition of 2 inches to obtain the calculated value. The anterior arm reach must be corrected by the addition of $2 \frac{7}{8}$ inches. Type C must have the total span corrected by the addition of $2 \frac{11}{16}$ inches for the attainment of the calculated value. The anterior arm reach must be corrected by the addition of $3 \frac{5}{8}$ inches.

C. Conclusions:

1. The Aviation Cadet series referred to in paragraph B1 above has been analysed on the basis of stature range to produce three basic size standards, producing three sets of data representing:

- a. An average of the entire population - stature range 156-198 cm. (61.5 inches to 78 inches).
- b. An average of the short $\frac{1}{3}$ of the stature range (17.3 per cent of the population) - stature range 156-169 cm. (61.5 inches to 66.5 inches).
- c. An average of the long third of the stature range - 184-198 cm. (72.5 inches to 78 inches).

2. Three articulated plastic manikins have been constructed on the basis of the three sets of specifications derived in paragraph C1 for the purpose of serving as basic size references in any

10000

Engineering Division
Memorandum Report No. ENG-49-695-28

way required by aircraft and aircraft accessory designers and manufacturers, as well as any further needs brought out on clothing and other related subjects. Designs of cockpits, turrets, catwalks, etc., may be studied with benefit of these manikins, as well as size of clothing, parachute harnesses, etc.

A line drawing of a person sitting on a stool, facing right, with their right arm extended horizontally. The diagram illustrates measurement points for the upper limb. A vertical ruler is positioned to the right of the arm, with a horizontal line indicating the measurement level. The ruler has two scales: one in centimeters (0 to 30) and one in inches (0 to 12). The measurement points are labeled as follows:

- Wrist: Indicated by a horizontal line at the 0 mark on the centimeter scale.**
- Elbow:** Indicated by a horizontal line at the 15 mark on the centimeter scale.
- Shoulder:** Indicated by a horizontal line at the 30 mark on the centimeter scale.
