3 SIDE PLATE RUDDER SYSTEM
4

5 STATEMENT OF GOVERNMENT INTEREST

6 The invention described herein may be manufactured and used
7 by or for the Government of the United States of America for
8 governmental purposes without the payment of any royalties
9 thereon or therefor.
10

11 BACKGROUND OF THE INVENTION

12 (1) Field of the Invention

13 The present invention relates to an improved system and
14 method of steering marine vehicles, particularly personal water
15 craft, that are propelled and maneuvered with water jets.

16 (2) Description of the Prior Art

17 In recent years, marine jet propulsion units have become
18 popular for recreational water craft. Such units ordinarily have
19 one or more propellers, which are driven within a tubular
20 housing, for drawing water into the housing from one end and
21 forcefully expelling the water at the other end to provide a
22 driving force for the craft. In some units, the tubular housing
23 itself is pivoted from one side to the other to provide steering.
24 In other units, a deflector plate is provided at the exhaust end
25 to deflect the jet flow to one side or the other of the craft.

26 A number of different steering systems have been used in
27 connection with water craft. U.S. Patent No. 3,982,493 to

1 Cronin, for example, illustrates a skid control mechanism having
2 longitudinally hinged flaps mounted to opposite sides of the boat
3 bottom. The flaps are operable to deflect into an open, water-
4 engaging position to prevent side slippage of the boat when
5 making high speed turns. U.S. Patent No. 3,003,536 to Bernier
6 illustrates yet another anti-skid system in which an elongated
7 vane extends along each side of the hull of the water craft.

8 U.S. Patent No. 5,437,568 to Kobayashi illustrates a water
9 jet propulsion system having an integrated rudder system.

10 U.S. Patent Nos. 4,949,662 to Kobayashi and 6,086,437 to
11 Murray illustrate steering systems for personal water craft. In
12 the Kobayashi '662 patent, the steering system includes a rudder
13 carried by a forward portion of the hull, which rudder is out of
14 the water at high speeds and submerged at low speeds for
15 assisting in low speeding steering. The Murray patent relates to
16 a blow back rudder consisting of a rudder blade, a rudder shaft
17 and a plate assembly that is pivotally mounted to a jet nozzle.
18 The plate assembly pivots the rudder shaft and the rudder blade
19 away from the exhaust port of the jet nozzle and out of the water
20 stream in the non-deployed position. A spring is attached to the
21 rudder assembly and the water craft for positioning the rudder
22 blade in the water when the velocity of the water stream ceases
23 or decays.

24 Another system for steering a jet powered water craft at low
25 speeds is shown in U.S. Patent No. 3,976,026 to Eastling. In
26 this system, the jet power unit of a water craft is provided with
27 a steering plate which is deflectable upwardly but which is

1 continuously oriented in the direction of, but spaced below, the
2 flow of water from the jet. The jet power unit includes movable
3 steering deflectors at its exhaust port which steer the craft by
4 deflecting the jet flow to one side or the other. The steering
5 plate includes a linkage system for pivoting the plate relative
6 to the craft in response to movement of the jet deflectors to
7 maintain the plane of the steering plate parallel to the
8 direction of jet flow.

9 Water craft safety remains a high priority in the
10 transportation industry and in federal, state, and local
11 governmental agencies. Of more recent concern is the safety of
12 the increasingly popular, water-jet powered personal water craft.
13 According to the U.S. Coast Guard, such water craft account for
14 36% of the vessels involved in marine accidents. Such water
15 craft can travel at speeds as high as 60 mph and rapidly spin 360
16 degrees in the water. In addition, water-jet powered personal
17 water craft offer almost no physical protection to the rider.
18 Because of these facts, control of water-jet powered personal
19 water craft is a critical factor. A recent study by the National
20 Transportation Safety Board and the United States Coast Guard has
21 indicated that the lack of off-throttle steering is a
22 contributing factor in many personal water craft accidents. In
23 many such craft, the only steering ability is that provided by
24 steering the thruster jet nozzle. When an inexperienced driver
25 wants to stop suddenly to avoid an unexpected obstacle their
26 first panic reaction is to let go of the throttle. When the

1 throttle is off the vehicle has no steerage and thus proceeds
2 straight into the obstacle.

3 Mechanisms that steer the personal water craft at low
4 throttle do not currently exist on commercial models. Thus,
5 there is a need for a steering system which operates when the
6 throttle is let off and requires no additional action from the
7 driver other than turning the handle bars.

8

9

SUMMARY OF THE INVENTION

10 Accordingly, it is an object of the present invention to
11 provide a steering system for a water-jet propelled water craft.

12 It is a further object of the present invention to provide a
13 steering system as above which is effective at low throttle
14 speeds.

15 It is yet another object of the present invention to provide
16 a steering system as above which may be operated by a driver by
17 turning a standard steering device onboard the water craft.

18 It is yet another object of the present invention to provide
19 an improved method of steering water craft.

20 The foregoing objects are attained by the steering system
21 and method of the present invention.

22 A steering system for a water craft in accordance with the
23 present invention broadly comprises at least two variable camber
24 plates or rudders mounted to a hull of the craft for steering the
25 craft, particularly at low throttle. Each of the plates has a
26 leading edge which is affixed to the hull and a trailing edge.
27 The steering system further comprises a linkage mechanism

1 attached to an onboard steering device, such as a wheel or handle
2 bars, for causing the trailing edge of at least one of the plates
3 to move relative to the hull and thereby vary the camber of the
4 at least one plate and impart a steering force to the craft. In
5 a preferred embodiment of the present invention, each of the
6 plates or rudders is formed from a flexible material.

7 A method for steering a water vehicle is also disclosed.
8 The method broadly comprises the steps of mounting first and
9 second variable camber rudders to a hull of the water vehicle and
10 varying the camber of at least one of the rudders using a
11 steering device on the vehicle to impart a steering force to said
12 vehicle.

13 Other details of the steering system and method of the
14 present invention, as well as other objects and advantages
15 attendant thereto, are set forth in the following detailed
16 description and the accompanying drawings wherein like reference
17 numerals depict like elements.

18

19 BRIEF DESCRIPTION OF THE DRAWINGS

20 FIG. 1 is a side view of a personal water craft having a
21 side plate rudder steering system in accordance with the present
22 invention;

23 FIG. 2 is a bottom view of the water craft and steering
24 system of FIG. 1;

25 FIG. 3 is a rear view of the water craft and steering system
26 of FIG. 1;

1 FIG. 4 schematically illustrates the linkage mechanism for
2 the steering system of FIG. 1;

3 FIG. 5 is a bottom view of an alternative embodiment of a
4 steering system for a water craft;

5 FIG. 6 is a bottom of view of yet another alternative
6 embodiment of rudder steering system for a water craft; and

7 FIG. 7 is a side view of the side plate rudder steering
8 system of FIG. 6.

9
10 DESCRIPTION OF THE PREFERRED EMBODIMENT(S)

11 Referring now to the drawings, a personal water craft 8,
12 such as a personal water-jet propelled craft, containing a first
13 embodiment of a side plate rudder steering system 9 is
14 illustrated in FIGS. 1-4. As shown therein, the system includes
15 flexible, variable camber plates 10 and 12 aligned with and
16 mounted to respective sides of the hull 14 of a water craft.
17 Each of the plates 10 and 12 preferably extends downwardly below
18 the chine 16 of the hull 14 as shown in FIG. 1. Alternatively,
19 the bottom of each of the plates 10 and 12 may extend downwardly
20 to the level of the chine 16 so that the plates 10 and 12 do not
21 extend below the hull 14.

22 Each of the plates 10 and 12 is fastened at its leading edge
23 22 and 24, respectively, to a respective side 18 and 20 of the
24 hull 14. The trailing edges 23 and 25, respectively, of each
25 plate or rudder 10 and 12 are movable relative to the hull 14.

1 Each of the plates 10 and 12 is preferably made of a
2 flexible material. The flexible material can be any corrosion
3 resistant flexible material including one selected from the group
4 consisting of a fiberglass material, a plastic material, a
5 corrosion resistant material, and corrosion resistant composites.

6 If desired, the flexibility of the material forming each of the
7 plates 10 and 12 may be varied over the length of each plate or
8 rudder to produce a hydrodynamically optimum camber shape.

9 The water craft typically uses any suitable water jet
10 propulsion system known in the art. In this type of propulsion
11 system the hull 14 has a water intake 26 along its bottom for
12 introducing water into the water jet propulsion system.

13 Additionally, the water jet propulsion system has a movable
14 outlet nozzle 28 for steering the water craft. The movable
15 outlet nozzle 28 may be moved from side to side using any
16 standard steering mechanism 29, such as a steering wheel, a joy
17 stick, or handle bars, linked to the outlet nozzle 28.

18 The steering system further includes a linkage mechanism 30
19 (FIG. 4) for causing one or the other of the plates 10 and 12 to
20 move away from a side of the hull 14. The linkage mechanism 30
21 includes guide blocks 32 and 34 mounted to the rear 36 of the
22 hull 14 and a pair of rods 38 and 40 pinned to the outlet nozzle
23 28 using any suitable pin connection known in the art. Each of
24 the rods 38 and 40 extends through one of the guide blocks 32 and
25 34 and terminates in a respective push plate 42 and 44.

26 Each of the rods 38 and 40 is preferably made from a semi-
27 flexible, corrosive resistant material such as a fiberglass

1 material or plastic material. If desired, the rods 38 and 40
2 could be replaced by steering cables.

3 While it is preferred to have push plates 42 and 44 at the
4 ends of the rods 38 and 40, these plates are not essential to
5 operation of the system.

6 In operation, when the jet nozzle 28 is steered to the
7 starboard as shown in FIG. 2, the starboard rod 38 pushes on the
8 flexible plate or rudder 10 to bend the plate or rudder 10 away
9 from the side of the hull 14 and thus produce a cambered control
10 surface interfering with hydrodynamic flow and steering the craft
11 to the starboard. Meanwhile, the port rod 40 pulls away from the
12 plate or rudder 12 which remains substantially straight and in
13 position against the side of the hull 14. When turning to the
14 port, the port rod 40 pushes against the plate or rudder 12 and
15 moves it away from the side of the hull 14. At the same time,
16 the starboard rod 38 pulls away from the plate or rudder 10 which
17 remains substantially straight and in position against the side
18 of the hull 14. As can be seen from the figures, the more one of
19 the plates 10 and 12 is moved away from a side of the hull 14,
20 the more the camber changes.

21 When the water craft 8 is traveling at high speed, the hull
22 14 will be planning and the plates 10 and 12 will be mostly out
23 of the water. Thus, the turning force due to the plates 10 and
24 12 will be minimal, and most of the turning force will come from
25 the water jet outlet nozzle 28 which is being operated by the
26 steering mechanism 29. When the water craft 8 is slowing down,
27 particularly in an off throttle situation, the water craft 8 will

1 sink back into the water and more of the plates 10 and 12 will be
2 in the water to produce a larger steering force. If the operator
3 leans into the turn, this will put the flexed rudder 10 or 12
4 deeper into the water, producing a larger turning force.

5 The steering system 9 of the present invention provides
6 improved steering capability with the throttle off and improves
7 the steering performance of water craft, particularly personal
8 jet-propelled water craft. The steering system 9 of the present
9 invention has no negative impact on vehicle resistance and
10 acceleration when going straight.

11 The steering system 9 described above uses semi-flexible
12 rods 38 and 40 mounted on the stern of the water craft 8 to
13 actuate the plates 10 and 12. This particular configuration is
14 used to have minimal impact on the design of a personal water
15 craft and to allow easy retrofits; however, there are a large
16 number of different linkages that could be used to actuate the
17 plates 10 and 12. Stiff rods could be used in lieu of the semi-
18 flexible rods with a slide pin linkage on the jet nozzle 28.
19 Rods with a pinned joint in the middle and multiple guide blocks
20 could be used. If desired, the linkage mechanism 30 could be
21 moved inside the vehicle hull 14. If desired, the rods 38 and 40
22 do not have to be linked directly to the jet nozzle 38, rather a
23 separate pivot arm could be used.

1 FIG. 5 illustrates an alternative embodiment of a steering
2 system 9' in accordance with the present invention. In this
3 embodiment, the flexible plates 10 and 12 are mounted to the
4 sides of the hull 14 of a water craft as in the previous
5 embodiment. In this embodiment, however, the linkage mechanism
6 30 includes a pair of rods 38' and 40' which are each pinned to
7 one of the plates 10 and 12 at points 70 and 72 respectively so
8 that they pull on the plates 10 and 12 as well as push them.
9 During a turn, both plates 10 and 12 are bent as shown in FIG. 5.

10 An advantage to this type of steering system is an increase in
11 the turning force relative to that obtained by bending only one
12 of the plates 10 and 12.

13 FIGS. 6 and 7 illustrate another embodiment of a steering
14 system in accordance with the present invention. In this system,
15 a plurality of flexible plates 50, 52, 54 and 56 are mounted on
16 the bottom 58 of the hull 14 of a water craft. The flexible
17 plates 50, 52, 54, and 56 each have their leading edge 55 fixed
18 in place on the bottom 58 of the hull 59, while their trailing
19 edges 57 are free to move. The linkage mechanism 30" includes
20 one or more actuating rods 60 pinned to each of the flexible
21 plates 50, 52, 54 and 56 and to a member 61 which is movable
22 about an axis 62 by an onboard steering mechanism 64. The
23 actuating rod(s) both push and pull the flexible plates 50, 52,
24 54 and 56. This system has the advantage of increased rudder
25 area for increasing the turning force. Additionally, in this
26 system, the flexible plates 50, 52, 54, and 56 would always be in

1 the water (except when jumping) and thus provide more reliable
2 steering capability, particularly for a novice operator.

3 The invention may have other variations not specifically
4 described in this specification. While it is preferred to form
5 each of the variable camber plates 10 and 12 from a flexible
6 material, they could each be formed by any suitable variable
7 camber foil structure known in the art. While the steering
8 system of the present invention is designed for personal jet-
9 propelled water craft, it can be used on any water craft that is
10 propelled and steered by a pivoting water-jet and thus cannot be
11 steered unless it is under power. The steering system of the
12 present invention could be used to provide steering for any water
13 vehicle including a submerged vehicle such as a submarine, a
14 remotely operated vehicle, and an autonomous underwater vehicle.

15 The steering system of the present invention enables the use
16 of water-jet propulsion for marine vehicles where currently such
17 an application would be impractical or unsafe.

18 It is apparent that there has been provided in accordance
19 with the present invention a side plate rudder system which fully
20 satisfies the foregoing advantages, means, and objects set forth
21 hereinbefore. While the present invention has been described in
22 the context of specific embodiments thereof, other alternatives,
23 modifications, and variations will become apparent to those
24 skilled in the art having read the foregoing description.

25 Therefore, it is intended to embrace those alternatives,
26 modifications, and variations.

1 Attorney Docket No. 79978

2

3 SIDE PLATE RUDDER SYSTEM

4

5 ABSTRACT OF THE DISCLOSURE

6 The present invention relates to an improved steering system
7 for a water craft and an improved method of steering. The
8 steering system includes at least two variable camber plates or
9 rudders mounted to a hull of the water craft for imparting a
10 steering force to the water craft. Each of the variable camber
11 plates is preferably formed from a flexible material and has a
12 leading edge affixed to the hull. A linkage mechanism is
13 attached to a steering device on the water craft and causes at
14 least one of the plates to move relative to the hull and thereby
15 vary the camber of the at least one plate.
